THE BUILDING NEWS

AND ENGINEERING JOURNAL.

THE CLERK OF WORKS AND HIS DUTIES.

IT is not always easy to find a good clerk of works; and for want of method, management, and direction, it is possible that, however good, he may be of little use when found. Every profession contains a few discreditable members, and more than a few incompetent ones; so that if both sorts may at times be met with amongst clerks of works, it is no more than can be said with truth of any equally numerous body of men. The clerk of works who is in the builder's pay is much talked of, but little seen. Contractors do not commonly stoop to bribery; and if they did, a competent man would not find it worth while to throw away his chances for life by accepting bribes. The incapable clerk of works is much less rare than the dishonest one: and the idle clerk of works, too, is by no means unknown. Perhaps there is something in the nature of the employment which encourages and develops idleness where there is naturally a tendency to it. When the builder is careful and straightforward, and when everything is going on smoothly, it may happen for long periods together that the clerk of works finds no great reason to exert himself much. This absence of exertion may grow into a habit: and then, woe to its possessor when he is placed in circumstances which call for energy and decision.

One meets with two opposite notions—both wrong—of what energy and decision in this sphere really mean. "You will find me a thoroughly energetic man," said a clerk of works to an architect not long since. "For instance, when I was superintending Mr. X's house in North Wales, a year or two ago, the contractor sent us a truck-load of bad bricks. Well, I did not lose an hour in telegraphing to London for the architect to come down, and the moment he saw the bricks he agreed with me that they were a bad lot." Here was a man who thought he had displayed wonderful activity simply because he had shirked his own clear duty, which was to condemn bad materials, and had imposed on the architect a needless journey of five or six hundred miles. Of course, this man, whom we may call A., did not retain his appointment for many weeks. B., who was employed on a large public building in the North of England, erred, on the contrary, in the direction of too much self-reliance. He was always ready to settle every sort of question, no matter whether it referred to planning, to construction, or to design, without consulting the architect at all. When that functionary visited the works, and found all sorts of features and contrivances introduced which he had never dreamed of, B.'s ready explanation was, "We did not want to trouble you." At last B. was pleased, in the architect's absence, to alter entirely a large and very conspicuous part of the roof. He had

failed to see clearly what was intended there, and instead of sending a letter or a postcard to inquire, had produced, from his own head, one of the most appalling monstrosities ever erected. In short, he had troubled the architect, not for a day, but for a lifetime. So it always is with the builder, or the foreman, or the clerk of works, who oversteps his own province. He may find it pleasant to attempt the architect's duties; but he should remember that it is the architect, and not he, who will bear the blame if those duties are not properly discharged.

The business of the clerk of works is to get his building erected according to the drawings and specification; but, at the same time, to call the architect's attention to any difficulties in working to them, and to any weighty reasons which may occur to him at any point for deviating from them. He has especially to see that the materials and workmanship are everywhere of the quality contracted for. If they are not, he is to exercise his power of rejecting them. If he and the builder differ about their quality, they can send a specimen to the architect, on which he can give a final judgment. There are cases, of course, in which he must visit the works before doing this; but there is no need to bring him down for every ill-burnt brick or sappy board that has to be sent off the premises. The chief use of a clerk of works, in most cases, is just to condemn such things as these, and to get them removed; and if he cannot do as much as that, there might almost as well be no clerk of works at all.

Another part of his business, and a very important one, is to see every portion of the work properly completed. Some contractors have a way of nearly, but not quite, finishing. They will leave out the beam-filling here, and the flashings there; they forget to connect the drains with the sewer; they omit to order the casement fastenings; and where they have made mistakes, they will delay, and delay, and delay again, to rectify them according to the architect's instructions. This, for the time, may save them a few shillings, and even, if the items are eventually overlooked, a few pounds. But they are sure to hear of these things at last; and the architect, if he is wise, will consider that time is too short to justify him in employing men who waste so much of it, and will take good care to strike them off his list. It is where there are contractors of this sort that a really good clerk of works makes himself most valued. He looks out for, and makes exhaustive lists of, all such omissions; especially he notes down the errors which have to be altered, and then, undeterred by delay and shuffling, he gives the foreman no peace till every item is really complete. The idle clerk of works leaves the architect to remember such things himself, and unless he does remember them, and asks about them at every visit, will trouble

no more about them. There is not much use in a man who lets things escape him in that way.

If the architect is at a distance, he should be told at intervals of a few days, exactly how far each part of the work has proceeded, and whether he is far or near, a permanent record should be preserved, by which it can be precisely known at any length of time after completion, at what stage each part had arrived in any given week. A mere description will not always answer this purpose. A man may be an admirable clerk of works without having the power of literary composition, and even if he has it, he will find it a tedious and troublesome thing to explain, in words alone, exactly how far the walling and roofing, the joinery and plastering, or the plumbing and painting had got by a particular day, in every portion of a complicated structure. By way of assistance, it has been found useful to lithograph on the back of each weekly report which the clerk of works sends in an outline plan of the building to a fairly large scale. He can then write, for instance, on each wall, under date, say of July 1, 1892, its average height above the datum. One may be marked 6ft., another 10ft., another 0, with a note, "damp-course being put on"; and the same principle may be carried out in the successive trades till all are complete. A set of outline-plans like this, filled in and dated from week to week, is a great protection, both to the architect and to the owner. Complaints of having had to "wait for details" can in this way be checked, and settled one way or the other, no matter at what period they may be made; and inexcusable delays on a builder's part can be brought home to him with something like certainty. The clerk of works should also keep a careful list of all the drawings sent him, and of the dates of their arrival. The architect's visits, too, should be noted down, without exception.

The clerk of works should ask for drawings and directions in good time. It is a great mistake to neglect this till it is almost too late for a reply. An architect may be engaged in many different ways when a belated request of this sort arrives, or he may be away inspecting buildings in a different part of the kingdom. Then, again, the clerk of works should have all his questions written down in readiness for each of the architect's visits. Care and order in this matter save much time and prevent many errors. It is a bad sign when an architect has to find out for himself the points in which the work or the materials differ from those specified. If anything is wrong, he cannot be informed too soon: there is no worse policy, either for the contractor or for the under-superintendent of the works, than that of trying to keep him in the dark. The sooner an inaccuracy is pointed out to him the easier it is to rectify it; it is the attempt to avoid

rectifying, to hide things up and say, "Oh, he will never see them," which leads to serious trouble in the end. No architect, if he is possessed of common-sense, will retain a clerk of works who uses him in this way. He will recognise the kind of man he is dealing with: the kind which is in league with bad masons, helping them to hide flaws by means of stone-dust and shellac; or with bad bricklayers, showing them how to patch up broken bricks with coloured cement; or with bad joiners, who are bunglers with wood but artists in putty; the sort of man, in short, who leaves out dowels, narrows lead flashings, lets the lap of the slates take its chance, rejoices in snapped headers and joints not flushed up, passes stone worked on the wrong way of the bed, and is only anxious that the building should show a fair face till he is paid off and done with. After that sort of man comes the deluge.

A well-meaning man of the very opposite type sometimes causes much trouble by going beyond his powers. In his case, the building goes on satisfactorily till its close; and even afterwards there is no fear that the evils will appear which result from the employment of the secretive man. The work, in short, is really well done. It is when the accounts come in that difficulties begin. "What is this?" says the architect, as he looks down the bill of extras and finds a claim for several hundred feet cube of additional stone. "Oh, that," replies the contractor, "results from the way in which the clerk of works insisted on our executing the main arches. They were taken in the contract as being in separate orders, with bond-stones at intervals; but Mr. D. told us to sink the three orders out of a single stone." "Did you not know," replies the architect, "that Mr. D. had no power under the contract to order extras of any sort?" "Well, the general conditions say so; but he told us to do it, and a builder does not like to oppose the clerk of works. At any rate, your clients have got the benefit of the alteration, and I hope they will not hesitate to pay for it." So it goes on with item after item. The building, which had been carried out without any departure worth naming from the original design, is saddled with a heavy bill of extras, and the architect, who neither ordered them, nor, in many cases, knew of them, has to bear the blame. Plainly enough, Mr. D., instead of ordering things to be done which he had no power to order, ought to have referred all such questions to his superior. If the extras were necessary, they could then have been agreed to by the owner as the work went on. People do not like unexpected claims to be sprung upon them after a building is completed.

One more point remains: the best way of carrying on the correspondence between the architect and the clerk of works, when the latter is employed at a distance. He will constantly be receiving questions to which answers are required; and, on the other hand, he will often be asking such questions. If this is done by letters on each side, much time is likely to be wasted. It is not every man, however fit he may be for the post of under-superintendent, who can write a short, business-like letter, easily legible, and giving just the information that is wanted. But any man can write down "Yes" or "No" to a plain question. If he is once cut off from fine words and attempts at composition, he may even venture further without becoming unintelligible. A good way of cutting him off from these, and keeping him to the subject in hand, has been found in the use of sheets ruled in two columns, one headed "questions," and the other "answers." If the architect wants to know about any points, he writes in the "question" column, and numbers his queries 1, 2, 3, &c. The clerk of works replies in the "answer" column, heads his replies with the same numbers, and then returns the whole sheet, showing ques-

tions and answers side by side. When it happens that he wants information, he takes a similar sheet, and writes in the "question" column, the architect replying in the other. These sheets, when preserved, form a sort of history of the building, and show at once what orders for alterations were given, and at what dates.

ARCHITECTURAL EXAMINATION PROGRAMMES.

MANY schemes of examination have been proposed for students of architecture, and we may expect others based on those which the leading professional bodies in Europe and America have formulated. As we have argued before, no scheme will be successful or meet the requirements of the younger men about to enter the profession if it does not provide for the several grades of candidates or men of differing mental calibre and qualifications; but as far as we have seen this natural division has not been adopted. Thus the man who is a born architect has to pass through the same examination as he who is a born mathematician; the man who has made styles and ornament and drawing his principal forte has to compete with the candidate who has had some experience in the practice of construction, or is an expert in quantities, the valuation of property, &c. Up to a certain point, indeed, we cannot legislate for differences of aptitude or mental endowment, as it is necessary to make a professional examination so far complete and many-sided, that he who qualifies may possess a passport of his competence in all these branches; but why should there not be an opportunity afforded to a candidate endowed with particular gifts or qualifications to enter a class adapted specially to his needs, in order that the number of marks required to pass the given subjects may be proportioned to the candidate's powers, or bear some direct relation to his natural capabilities and educational position. It will no doubt be objected to this arrangement that a man may be admitted to practice who has won very few marks in the groups relating to architecture proper, and be able to compete on equal grounds with those who are more competent as architects; but this objection is not so strong or fatal to the true artist as may be imagined. Even if the individual who has barely gained the minimum of marks for art competes with his more competent brother, he will have very little chance of taking a lead; but, as a matter of fact, he will soon begin to find out that architectural design is not his strong point, and will hesitate to go in for such work. He will soon discover the branch for which he is more suited, and by a natural law of "selection" he will seek those fields of practice which are more congenial to him, and in which he is better able to wage a warfare with profit. This finding out one's level is a process which takes place in every business and vocation. Why is it that men like Mr. Waterhouse, Mr. Pearson, Mr. Jackson continue to take the lead in architecture? Have they not won it by the exceptional merits of their works? Others, no doubt, are close at their heels who will in time take their place. Examination will not alter this state of things, any more than schooling or university education will insure success in any profession. Natural ability and energy alone will do this. We need not, therefore, fear the result of allowing every candidate to devote himself to those studies for which he is most fitted, for we may rest assured that natural ability in any one direction will always give him a priority in practice.

We therefore think it necessary that, in the schemes for architect's examinations, promoters should arrange for special branches, as the Surveyors' Institution have esta-

blished in their "special" certificate examinations, by which candidates who are members of the Institution can take up either agriculture or forestry, sanitary science, or land surveying and levelling. In the ordinary qualifying examinations the same division of subjects is recognised, embracing land agency, valuation, and building, so that students can be examined in any of these sub-divisions they prefer, and there are classes for students, non-students, and fellowship. By allowing candidates to take up either architecture and art, construction or surveying, the examinations might be made popular, and a larger number of young men would avail themselves of the opportunity. The Royal Victorian Institute of Architects of Melbourne have issued a programme of their Examination to qualify for candidature as associates, which is of interest. The examination is to be written, graphic and oral, and every candidate must be of the age of 21 years. He is required to submit a statement as to his general education, proofs of his ability in drawing; the probationary work to be any drawings of the student's own design fully drawn out as working drawings to a scale of $\frac{1}{4}$ in. to the foot, fully figured, with details of construction and ornament, and a perspective view, also a drawing of architectural ornament, Classic or Mediæval, from the round. These, however need not be expressly made for the examination, and will be returned after. A fee of three guineas is required in sending an application. The number of marks is 1,000, divided in certain proportions for the different subjects. The most important feature of the examination is that a candidate can take any one of three groups, A, B, or C, in successive examinations, instead of the whole; but he must obtain two-thirds of the total number of marks of each group, and not less than one-half of the marks in every subject. The groups are:—A, history and characteristics of the styles of architecture; mouldings, features, and ornaments to be illustrated by sketches characterising the styles; geometrical and perspective drawing. Group B includes shoring, sanitary science, water and gas supply; properties and application of materials; principles and practice of construction. Group C comprises drawing and designing, planning and arrangement, taking a building for a given purpose; specifications, quantities and professional practice, including conditions of specification or contracts; public health regulations, building regulations, &c. Each of these subdivisions or subjects in each group has a certain number of marks attached. A candidate to pass must obtain half the total number of marks, but not less than one third of those in every subject if the programme is taken as a whole. Thus for Group A the total number is distributed as follows:—For history and characteristics of styles illustrated, 100 marks; mouldings, features, and ornament illustrated, 125 marks; geometrical and perspective drawing, 75 marks, or total of group, 300 marks. In the next group B, 25 marks is put down for shoring, 100 for sanitary science and water supply; 100 for materials, and 100 for principles and practice of construction, making a total of 325 marks. In Group C, 125 marks each is given to drawing and designing, and planning and arrangement, 50 to specifications, and 75 to quantities and professional practice, making in all 375. These are the main outlines of the programme of subjects, which is accompanied by a list of suggested books. Candidates are recommended to practise sketching in perspective, as illustrations and answers thus sketched will receive more marks. No certificate is to be given nor results announced until the candidate has passed in all the groups. It will be seen from this programme that the highest number of marks is allotted to Group C. It is also to be noticed that

mouldings, features, and ornament; drawing and designing, and planning, each has the largest number of marks attached—namely, 125. The two last subjects are, indeed, the most important from an architect's point of view, though we think a more logical distribution of subjects would have been to confine Group C to "designing and planning," placing drawing earlier, next after geometrical drawing and perspective. A fourth group for professional practice seems to suggest itself.

The subjects should have some affinity in each group. A knowledge of styles, history of typical buildings, mouldings and features, demands acquisition of facts, and the faculties of discrimination and memory are chiefly involved. Drawing is an aptitude which calls into play another kind of power: the eye and hand are jointly engaged with the mind, and a knowledge of geometry or projection is a necessary accomplishment. There is also a very real distinction between drawing as a means of representation in delineating objects and buildings and designing power, as every artist is aware. It is possible to make a geometrical elevation of a given building, or even a perspective of one, without having the skill or inventive faculty to design a building. The last operation is purely mental and imaginative, whereas drawing is simply the mode of expressing ideas, though the more skilful a man is in the use of his pencil, the greater facility he has. In planning, actual data are necessary in addition to the artistic function. These subjects, therefore, necessarily come after the attainment of the properties, and application of materials and principles of construction, and also after the knowledge of the characteristics of styles, mouldings, and features, all of which are matters that must be taught from books, classes, and actual buildings. It may be difficult indeed to draw any hard-and-fast lines between groups of facts so intimately related as those of styles and construction; nevertheless the framers of an examination programme must distinguish between subjects which can be learned and those which to a large degree depend on the invention and imagination of the candidate.

RAINFALL: ITS DISCHARGE AND STORAGE.

THE heavy, and in some cases serious, rainfalls we have experienced of late ought to teach drainage engineers and builders the importance of providing for some of that surplussage of water which, if neglected, causes such havoc in the lower districts of our towns in addition to other and worse evils. It is the practice now to use small drain-pipes and sewers, because we are told they cleanse themselves better, and are more economical in results than large ones—a theory which is perfectly true regarded from a strictly scientific point of view, but which does not hold good when an unusual rainfall occurs, or when we consider that a drain has not simply to convey water, but solids and other extraneous substances that are likely to adhere to the sides and cause obstruction. A similar theory is held by some engineers in the design of iron structures: they are fond of advocating small factors of safety on the ground that members in compression and tension, if made larger than bare theory requires, add unnecessary weight without increasing the real strength of the structure. To such we may say that theoretical formulæ do not take into account all the conditions required for practice, for proof of which we can refer to the repeated failures of American bridges, which are generally constructed on minimum data. When we are told that, allowing for a rainfall of, say, 1in. per hour, a 4in. drain laid at a small inclination will discharge all the drainage of a

building containing 20 people, and having an area of 11,000 superficial feet, we must accept the statement with caution, as this calculation does not take into consideration the risks of badly-laid and jointed drains, bends, the reductions of the full bore of the pipe caused by partial obstructions and the hundred other accidents to which house-drains are exposed. The effect of a clumsy joint, incrustation, settlement of ground, or a sharp bend, is to diminish materially the discharge through a pipe. Can it otherwise be explained why so many houses of small size drained by 4in. drains suffer from any unusual rainfall? In a number of districts in London a sudden or continued rainfall entirely disorganises the system; the basements are invariably flooded with diluted sewage water, the gullies get clogged, and offensive odours make themselves perceptible in the house. No doubt imperfect jointing and laying are accountable for many of these grievances; but they only prove the desirability of employing a size of pipe that will reduce the risks to which all ordinary drains are subjected whenever a more than usual rain occurs. The small drain-pipe under heavy rains is liable to run quite full and be subject to pressure. Hydraulicians have not themselves agreed as to the amount discharged through a pipe. Comparing the results of Eytelwein's formula with that of Neville's or Darcy's, we find differences, the first showing a larger discharge than that of the second or third, as any set of tables based on these formulæ will show. But confining our attention to practical matters, the loss of head in a water-pipe, due to a bend or an elbow, is a perceptible quantity, and if these are numerous, the loss is considerable; also it must be considered that the smaller the pipe the greater is the resistance of the bend. In the discharge of drainage through a small pipe, therefore, the straighter the pipe the better.

Architects and builders are not generally experts in determining how large drain-pipes should be to carry off heavy rains, and to what slope they should be laid. These are questions left to the builder or drain-layer or are decided by reference to ordinary practice. The pipes should at least be large enough, that they should flow partially full; should be inclined enough, so that the velocity be sufficient to keep the pipes clean. For small pipes the velocity ought, of course, to be greater than for large ones, and it has been laid down that for small drains of 6in. to 9in. in diameter, the velocity ought to be at least 3ft. per second, and for large ones where the water forms a large proportion of the discharge, not less than 2ft. per second. Very few ordinary house-drains fulfil these conditions of velocity.

According to a table calculated on Darcy's formula, a pipe 320ft. long, with a maximum discharge of 4c.ft. per second, and having a fall of about 3ft., ought to be 12in. diameter, which will run nearly full. The velocity of discharge is calculated at 5.4ft. per second, sufficient to keep it clear without flushing. In other words, the length of pipe divided by the inclination multiplied by the square of maximum discharge per second, or $\frac{320}{3.1} \times 4^2 = 1,650$, gives a value which corresponds with a diameter of 12in. In many drains of this length and fall a pipe of 6in. is thought enough. When the wetted perimeter is large in comparison with the amount of water, a small velocity is obtained, and flushing becomes important; but the main consideration is to make the pipe large enough to discharge the maximum quantity of rainfall without being quite full.

The question of storage has not been much considered in towns; perhaps the collection of rain-water would, considering the smoky state of the atmosphere in large towns, be scarcely

of any value. But why should not the "rain-water separator," such as that of Mr. Roberts, be more generally fitted up to ordinary houses, by which contrivance the first showers and cleanings of roofs and gutters runs to waste, while the after clean rainfall is stored? Anyhow, there may be some plan of collecting the rain-water after turning a tap to allow the first scourgings to be run to waste. No great expense would be entailed by a receptacle properly situated for collecting the cleaner water during heavy rains, which apparatus might be manipulated from the house. The present indifference about town rainfall collection, the allowing house-pipes to discharge into gullies, is no doubt owing to the ample water supply obtained, and it is thought justly, that as the drains want periodical flushings, the best plan is to utilise the rainfall for this purpose. But the irregularities of Pluvius have long taught us that we may have more rain than is good for us, that the Clerk of the Weather may sometimes bestow on one district or area a larger portion of his favours than another, and that if it were not for means of outlet his bounty would mean deluge. The surplus water often does incalculable harm in saturating the soil beneath our houses, in causing the sewers and drains to disgorge themselves, and to back-water our premises. We have to consider the means of diverting this overabundance. The reservoir-sewer or the storage-tank is available. The former, we know, has been objected to, because it increases the volume of dangerous gases, and adds to the cost. No doubt, good reasons in certain circumstances; but the large sewer has advantages in towns where temporary storage is a necessity, and of which we could point to several which have only been relieved by large outfalls and storage tanks. The second alternative of storing rainfall is the most desirable in many towns in the Midlands. But the town unit is the house and its curtilage, and here something more can be done than we are in the habit of doing. When we think that every quarter-inch of rainfall gives thirteen gallons on every 100ft. of area, or on a space of lead flat or yard of 10ft. square, we see the value of diverting or saving some of this. If we take an ordinary London house and its yard or back area, say a plot 95ft. deep by 20ft. in frontage, we get 1,900sq.ft. yielding 247 gallons, which, allowing 23 gallons for each individual per day, will provide for eleven persons; but if only used for washing and cleansing purposes would supply at least double that number. But as we get rainfalls of over 1in. or 1½in. per hour, we may soon calculate the large quantity of water that might be stored in the course of a few days' heavy rainfall in the year by a small outlay for storage reservoirs or tanks. In these days of monopolising water companies and river pollution, the subject is one that deserves the serious attention of every sanitary authority, property and house owner. The subject is at least a practical one for the architect as well as the engineer, upon the latter of whom has mainly devolved all questions of hydraulics as applied to building.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE closing meeting for the present session of the Royal Institute of British Architects was held on Monday evening, the President, Mr. J. MacVicar Anderson, in the chair, the chief business being the presentation of the Royal Gold Medal, which this year had been awarded by the council, with Her Majesty's permission, to M. César Daly. The President, in making the presentation, remarked that in their recommendation of a recipient for the honour, the council recognised no merely local, or metropolitan, or even national limit; the sphere of

selection was as unrestricted as that of art itself—it was the wide world, a consideration which materially added to the value of the honour. They had that year recommended to the Queen the name of one who was a veteran in the world of art, a giant when measured by the products of his pen, one whom they were proud to honour as a distinguished Frenchman, the octogenarian M. César Daly. Few could point to such monuments of literary research as embodied in the pages of the "Revue générale de l'Architecture et des travaux publics." Few there were who had found time and energy to publish such a series of important architectural works as "Motifs historiques d'Architecture et de Sculpture d'Ornement," "L'Architecture privée au XIX^e siècle," "L'Architecture funéraire contemporaine," "Mobilier d'Eglises," "Cours de Constructions," to say nothing of endless brochures and more fugitive essays which had emanated from his prolific imagination. Such a record as this, one would think, would be more than sufficient to satisfy the most ambitious author, but M. César Daly contemplated the compilation of no less a work than a dictionary of architecture. The President proceeded to give a biographical sketch of the medallist's career. Born in France in 1811, César Daly was, he explained, brought at an early age to England, where he was educated, remaining till he was 15 years old. Returning to France in 1826, he attended classes at the College of Douai; at 16 he joined the preparatory section of the Ecole Polytechnique, and at 17 carried off the first prize for drawing. He entered the office of M. Mallet, an architect at Douai, continuing at the same time the study of higher mathematics with M. Avignon, professor at the Ecole Polytechnique. He was nearly 20 when he left Douai for Paris, and entered the studio of M. Duban. Young Daly took notes of all that he met with in his provincial tours that appeared to him to possess architectural interest, and the influence of such studies of old work was soon apparent in his compositions, which drew forth the congratulations of Duban. Labrousse also showed him great kindness, and when, in 1839, César Daly established the "Revue générale de l'Architecture," it was Labrousse who designed the frontispiece. In 1843 M. César Daly was appointed diocesan architect of Alby, and fulfilled the duties of that office for twenty-five years, carrying out the restoration of the Cathedral of Alby. M. César Daly was the first, in 1848, to found a society for decorative or industrial artists engaged in designing for trade manufacturers, and he insisted on their admission to the societies representing the Fine Arts. In the same year he organised a meeting of architects, painters, sculptors, poets, and critics, in order to elect and send to the Constituent Assembly a representative, whose special province it would be, in all circumstances, to protect the interests of art. The assembled artists, however, could not agree, each department refusing to the others any claim to the title. Narrow-minded jealousy and deplorable ignorance rendered united action impossible, and M. Daly had to be content with recommending each section to meet independently and appoint delegates to represent the Arts. He was an original member of the Council of Architecture, founded by ministerial decree in 1848 for the purpose of examining and approving the design and construction of ecclesiastical buildings for which a grant was required from Government. Having referred to M. Daly's journeys of exploration in Mexico, Russia, Asia Minor, and Egypt, and to the many honorary distinctions he had received, the President presented him with the medal, expressing a hope that his life would still be spared for some years of useful activity.

M. DALY, who spoke in excellent English, said that he knew of no greater honour than that which he had received that evening. Many of his earliest associations were with England, and the affection he then conceived for it had never been weakened during the sixty-seven years that had passed away since he left it to become an architect in France. M. Daly referred to the present position and prospects of architecture before which, he said, a new world was opening.

Mr. J. D. CRACE read a description of the collection of architectural drawings by Palladio and others, originally obtained by the Earl of Burlington, and lent to the Institute by the Duke of Devonshire for a few days before removing them from Chiswick House to Chatsworth. A

detailed notice of the drawings appears on another page.

On the motion of the President, seconded by Mr. ALMA TADEMA, R.A., votes of thanks were passed to the Duke and to Mr. Crace.

LAND SURVEYING AND LEVELLING, AND THE TESTING, ADJUSTMENT, AND USE OF MATHEMATICAL INSTRUMENTS.

By G. W. COBHAM, P.A.S.I.,
("Crawter" and "Special" Prizeman of the Surveyors' Institution.)

(Continued from p. 793, Vol. LXII.)

TRAVERSING WITH THE CHAIN.—In the cases described in our last, the fields admitted of tie-lines being measured across them. There is, however, a large class of work where it is impossible that lines can be taken at any great distance on either side of the circumscribing chain-lines. We then have to have recourse to traversing. The straight lines present no difficulties; the matter resolves itself into the problem of finding the inclination of two lines. Figs. 9—13 illustrate various ways of doing this. In each case A B is one line and B C the other, B being the point where they intersect.

Fig. 9.—In this case a tie-line D E is taken

FIG. 9

FIG. 10

between the two lines. It is used when the deviation of the direction of the new line from the direction of the old is large.

Fig. 10.—In this case the old line A B is produced to D, and a line D E measured to the new line B C. It is used when the deviation is small.

Fig. 11.—In this case both the old and new lines pass the intersecting point B, the tie-line being measured from the extra parts of the lines.

FIG. 11

FIG. 12

It is used when the deviation is large. In each of these cases, the longer B E and B D are, the more accurate will the work be.

Fig. 12.—This is a useful form where the deviation is very small. F is a point outside the chain-lines. To plot, D B F is first laid down, then B F E and the new line B C drawn through B E.

Fig. 13 is practically the same as Fig. 12, except that the two triangles are taken on opposite

FIG. 13

FIG. 14

sides of the chain-lines. To plot, D B H is laid down, H B is produced to F; then B F E is laid down, and B C drawn through B E. In these

two cases D B, B F, F B, B E, E F, H B, and D H should be as nearly as possible equal.

Setting out Angles with the Chain.—The most useful angle is the right angle, when the new line is required to be perpendicular with the old one.

Fig. 14.—Take B D on the chain 30 links. Hold one end of the chain at D and the 90 tab at B; the centre of the chain, when it is pulled tight, is on the perpendicular from B. Another way is to take B D 40 links, and hold the 80 tab at B; the result is the same. It is not necessary that the sides be 30, 40, and 50; but they should be in the same proportion as 6, 8, 10, or 15, 20, 25, &c.

Fig. 15.—Measure B E and B F on the chain;

FIG. 15

FIG. 16

they must be equal, and should be about 20 or 25 links each. Hold one handle of the chain at E and the other at F; when it is pulled tight, the centre will be on the perpendicular from B. This method is better than the last, as an error in the length of the chain will not vitiate the result, provided the two halves are alike, which can easily be tested by doubling the chain. Of course, it is not necessary to take up the chain to set out the perpendicular; a tape can be used, or even a piece of cord, having previously found the centre by doubling it. The first method must be used when the perpendicular is required at the end of the line. The only other angle that can be readily set out with the chain is one of 60° or 120°.

Fig. 16.—Take F E on the chain 50 links long; hold one handle of the chain at E and the other at F. F C makes an angle of 60°, whilst E C makes an angle of 120° with A D.

Setting out Lines parallel to existing Lines.—Fig. 17.—Set out A C and B D, making the same

FIG. 17

FIG. 18

FIG. 19

angle with A B, and of equal length; a line ranged through C D will be parallel to A B. A C and B D are usually made perpendicular to A B.

Fig. 18.—A C is set off from B E, and C D is set off from A C, the angle A C D being made equal to the angle C A E; C D is parallel to B E. The angles A C D and C A E are usually made right angles.

Fig. 19.—Take any point, E, also any two points, A and B, on the original line, produce A E to D and B E to C, making E D equal to A E and E C equal to B E; C D will be parallel to A B. It will be seen that E is just half-way between A B and C D. Of these methods that illustrated in Fig. 17 is the best. If a third line is taken, it will lessen the chance of error. Of course, in this case all three points will appear in the same line, or the work is incorrect; the mere fact of them being in the same line does not necessarily mean that the work is correct, but it would in this case be unlikely to be wrong. The method shown in Fig. 18 is unreliable unless great care is used in setting out the angles.

Obstacles.—In chaining a line it sometimes happens that we come to an obstacle which prevents us from proceeding with the line. These can be divided into two classes:—A. Those that prevent us measuring along the line, but which offer no impediment to sight, as rivers, ponds, or

quarries. B. Those that impede the sight, such as buildings or woods. Figs. 20 to 28 deal with the first class. In each case X is the inaccessible point. Figs. 29 and 30 deal with the second class.

Fig. 20.—AB, BE, and AE are made equal

(most conveniently half a chain), AE is produced to F, and EF, EH, and FH are also made equal; mark X on AD where FH cuts it. If the work is correct HX should be equal to AE. AF and FX are equal to AX.

Fig. 21.—Take any point, B, visible from both A and X. Take F half-way from A to B, and E half way from B to X. The distance AX is double the distance FE.

In these cases it is not necessary that X should be visible from A, provided we have some means of continuing the direction of the line. It is frequently the case that the obstacle is in a valley, when the line can be ranged over it. Of course, the lines should be made to avoid obstacles as much as possible.

Fig. 22.—BD is set off perpendicular to AX, and its centre point O marked. DE is set off perpendicular to BD, and the point E is taken

in a line with XC. DE is equal to BX. It is not necessary that the angles DBX, BDE should be right angles; it is only necessary that they should be equal. This makes the accuracy of the method of setting out immaterial, provided it is the same in both cases.

Fig. 23.—This is the same as the last, only the lines are set out on opposite sides of the chain-line, thus saving space. Take any point C, set out the angle XCB, produce CB to D, making BD equal to CD; set out the angle BDA equal to XCB, marking A where it cuts the chain-line. AB is equal to BX. This method is perhaps the best that can be used. The lengths CB and BD can be measured with a tape; the distance AB is, of course, read from the chain.

Fig. 24.—Set off BC at a known angle from

with CD, and on the chain-line; AB is equal to BX.

Fig. 25.—Set off BC at a known angle from AB. Set off CA, making the angle XCA equal to the angle ABC. Measure AB and AC. Square AC, and divide by AB, the result will be the length AB; or $AB = AC^2 / AB$.

Fig. 26.—Set out AD at a known angle to

AX. Set out BC at the same angle, and put C in a line with DX, measure AB, BC, and AD. Multiply AB by BC, and divide the result by the difference between AD and BC, which will give BX; or $BX = AB \cdot BC / D E$.

Fig. 27.—Take any point O, also C and B on AX. Produce BO to E, and CO to D, making OE equal to BO and OD equal to CO, produce DE to F in a line with XO; EF is equal to BX.

Fig. 28.—Make AC, CB, AE, CE, CD, and

BD all equal. Produce CE to F, let F be in the line XD, measure EF. Square AC, and divide by EF; the result is BX; or $BX = AC^2 / EF$. AC, &c., may conveniently be made half a chain if BX is under two chains.

We now come to the cases where we have to find the direction of the line as well as the length.

Fig. 29.—Make AC perpendicular to the line, CD perpendicular to AC, DB perpendicular to DC and equal to AC. Then set out the line perpendicular to DB; the length AB will be equal to DC. This is a very inaccurate method, as a slight error in the instrument used to erect the perpendiculars will be magnified four times in the result, and any small error in setting out any of the perpendiculars makes the result erroneous.

Fig. 30.—This is a much more accurate way.

AE and CE are set off at a known angle with the chain line and of equal length; a line is ranged through EF and HD, and IB are set off the same angle with it that AE made with the chain line, they are also made equal in length to AE; the direction DB is the direction for the line to be ranged. The distance HF is equal to CD. AC and IH should be made as long as possible,

and AE, &c., as short as possible. Instead of setting off EF by means of AE and CF, the method shown in Fig. 19 could have been used, and the distance CD determined by any of the methods we have given.

Fig. 31.—When an important point is to be put in with a rather long off-set, the method shown in this figure should be used; it will be seen that the positions of the angles of the building are independent of the accuracy of the setting out of the off-set at the proper angle.

ERRATA.—On page 793, column 1, line 69, for C read G; 74, for C read G; 75, for C read G; 85, for ACO read AGO; 86, for ICO read IKO.

(To be continued.)

WATER-COLOUR PAINTING IN ENGLAND.*

THIS is one of the excellent series of "Illustrated Handbooks of Art," edited by Edward J. Poynter, R.A., and published by Messrs. Sampson Low and Company. Mr. Redgrave has in this volume brought into a small compass much that has been written on the subject, and has furnished the student with a comprehensive sketch of the history of the art of water-colour painting in this country. The reproductions of drawings by leading artists in the collection at South Kensington, and in the Print Room of the British Museum, add considerably to the value of the book; and the author has availed himself of the recent History of the Old Water-Colour Society by Mr. J. L. Roget, to furnish many points of interest, including the origin of the Old Water-Colour Society, which was founded by ten members in 1804. The early history of this society is told. In the first chapter Mr. Redgrave describes the different methods of painting, which he divides into three periods—1. Early period, prior to 1780. 2. Middle period, from 1780 to the establishment of the Water Colour Society in their new gallery in Pall Mall East. 3. The Later period, from the final removal of the Society to Pall Mall to the present time. This is a somewhat unscientific division to our minds, even if we admit that the old Society exercised considerable influence over the practice of its members. It would have been more exact and descriptive to have classified the periods according to technical methods and style. For example, the Dutch school of water-colour painters, from whom it is said sprang the earlier school of English painters, drew their outlines with a reed pen, adding local tints of Indian ink, sepia, brown, grey, and other colours in thin washes, and this kind of art was, with modifications, adopted by many of our early masters, as Paul Sandby, Dayes, Girtin, and Cozens. This school is properly called the topographic school, as it sprang from the love of antiquarian research and Classic landscape. The Print-room of the British Museum furnishes many examples of the Dutch and Early English school, and the student will learn much by looking over the collection at the S.K. Museum. Afterwards the pen outline gradually gave way to stronger washes of colour, and the topographic style was superseded by the truer water-colour method, of which Cozens may be ranked one of the pioneers. Full and richer colouring succeeded. Mr. Redgrave gives some instructive reproductions of landscapes in these early styles, with buildings by Dayes, T. Hearne, J. R. Cozens, T. Girtin, &c., and his remarks are interesting. This period might with propriety be distinguished as that of water-colour painting, as the earliest was merely washed or tinted drawing.

Chapter III. deals with the work of Francis Wheatley, R.A., W. Hamilton, R.A., Sawrey Gilpin, R.A., J. H. Mortimer, A.R.A., Michael Angelo Rooker, A.R.A., Samuel H. Grimm, W. Marlow, J. Cleveley, J. A. Gresse, T. Stothard, R.A., and W. Blake, brief notices of whom are given, and a characteristic work by Wheatley, "The Little Gleaners" is illustrated. Next the works of J. M. W. Turner, R.A., his early and late drawings, are noticed, and two good examples given. Chapters V. and VI. describe the formation of the Society of Painters in Water-Colours, the Royal Society of Painters, and other water-colour societies which came into existence because of the scant justice done by the Royal

* By GILBERT R. REDGRAVE. London: Sampson Low, Marston, and Company, Limited, St. Dunstan's House, Fleet-street.

CARPENTRY AND JOINERY.—XLIV.

SKIRTINGS AND PLINTHS.

ALL the skirtings that have been dealt with up to now have been those composed of a single piece; but it will be obvious that this would only suit for comparatively narrow skirtings or plinths, or else for those of slight projection; but these difficulties are easily remedied by breaking up the skirting or plinth into two or more portions, as is convenient for the working thereof. For instance, take Fig. 290. This

plinth (deep skirtings composed of two or more pieces are usually termed plinths) would require 1½ in. of timber to get it out, and of such breadth as is required, which would be rather costly in most cases; but got out by this method, a bold moulding can be taken out of 1 in. thick, or, better still, out of 1½ in., and the plain portion with the scotia on its upper edge may be taken out of ¾ in. or ¾ in., and, of course, the breadth may be

FIG. 290.

FIG. 291.

arranged to suit. It will be seen that the moulding must be fixed first, and this is usually done to a strap which has been nailed along the wall before any plastering has been done, and the grounds are put up at the same time for the other portion. The strap is, of course, continuous around the room, except where windows and doors occur. The grounds for the plinth will be upright pieces fixed about 2 ft. apart, except in cases where the distance is less than this, or where two grounds are required to fasten it properly. The moulding will be put up all round first, scribing the internal angles, and mitring the external ones. It is to be observed that the upper edge of the strap to which the moulding is nailed is bevelled; this is to form a key for the plaster. Another point to be noticed is that there is a space between the moulding and the plinth, so as to form a quirk to the moulding. There may be designs of moulding wherein this is not necessary, and of course these will be arranged for accordingly.

Fig. 291 provides for two contingencies which may arise—viz., ¾ in. or ¾ in. may be too light for the plinth, and so the moulding may have a tongue or feather provided upon it, so as to enter a groove in the plinth, allowing for the plinth at least an inch in thickness, which will be heavy enough for most ordinary situations, and in addition it is seen that where the plinth would be so broad as to be unsightly, its breadth may be broken up by introducing the scotia shown in the bottom part of the figure. In this case the moulding will not be put on first, but last. Of course a strap will be required for the moulding; but the other portion, on account of its extra thickness, would only require grounds, say, 2 ft., 6 in. or 3 ft. apart. This plinth will be scribed and mitred as described for the previous one.

If any difficulty should present itself at some of the angles owing to the scribing being troublesome to get entered, a little might be taken off the tongue at the end which is to be first inserted, and if a length should occur too short to admit even of this, the simpler way would be to mitre it, and then it could be driven straight down.

Fig. 292 is evolved out of, or suggested by, Fig. 291, to avoid using such thick timber.

The grounds will be put up to suit, and the bottom piece of the plinth will be put up first. The bottom edge of the under-piece may be arranged so as to be put into a groove in the floor. This would require that it be rebated similarly to the edge of the piece above it.

The track or groove for the tongue left thus upon the under edge of the bottom portion of the plinth is made in the floor with a dado or trenching plane, a lath being nailed along the floor at the proper distance from the wall for that purpose. This lath requires to be planed straight on the working edge, seeing that the side of the plane is moving along it.

Of course, the proper distance from the wall will be best obtained from the sectional elevation, which should be got out in every case in order to prepare the various parts. A plinth such as this would be put up after the plastering is completed, and then the plumb-line of the plastering carried down to the floor would give the point to take the projection from. The plastering is stopped upon the strap to which the base-moulding is nailed, as shown in Fig. 290, and if the plinth is a deep one there will be no fear of the hands coming in contact with the plaster during the working of the groove in the floor. When corners interfere with the readily doing the work with the dado-plane, then the joiner must have recourse to chisels, large and small, or extemporised tools, so as to reach into these corners where the grooves join at right angles, and in most cases it will be found necessary to begin at the extreme end with the chisels in order to allow the dado-plane to work down.

Fig. 293 gives a case of skirting in four pieces; the method of its construction is easily seen from the drawing. Instead of grooving the floor, a heavy under-base is spiked to the floor. The spiking to the floor may be done where the groove for the portion above it occurs, so that the nailing may be concealed. No further preparation requires to be made for this, seeing that wherever joists occur a longer nail may be put in so as to reach into the joist. A strap would

FIG. 292.

FIG. 293.

be put along for the moulding, and grounds for the remaining portions of the skirting. It should not be necessary to state that these grounds should be put up previous to any plastering, nor should it be required to enter into further details, as the drawing is self-explanatory.

It needs only to be mentioned that such a skirting as that could be made of any depth required, as all the members could be extended in proportion.

Figs. 290 to 293 will serve as types of skirtings from which others may be modelled. It will be readily seen that some of them will do without base-blocks; but some of them must have them, and in the case of Fig. 293 it would be well if the base-block followed the outline of the skirting—at least, to some extent. But in what follows this will be entered into.

However, it may be stated that, if necessary, and with such a skirting as Fig. 293, if polishing or varnishing is intended, a good effect may be obtained by various coloured woods, the number of parts into which it is divided lending itself readily to this method of treatment. In Figs. 266 and 267, which occur in the 39th article of this series, there was given a plan and elevation of the base-block of an architrave which formed part of the finishing of a room where the skirting now to be illustrated was used.

Fig. 294 shows the upper portion of the Plinth and base moulding; there is nothing about this except that the moulding may be considered to be a very effective one on account of its outline. The entire trimmings of the dwelling to which this belongs were unique in character. As was then stated (Figs. 266 and 267) teak and pitch-pine were the timbers used, so also in the skirting the mouldings were teak, and the plain portions were pitch-pine, thus forming an excellent contrast.

Fig. 295 gives the remaining portion of the elevation of this plinth in order to have the idea of the whole. This section of the elevation is what occurs at the junction of the upper and lower plinths, showing the ogee moulding, which

breaks the continuity of the outline, and corresponds with a smaller moulding in other skirtings which have been described, but in which the mouldings formed part of the bottom plinth, and differed from this in that it was worked on the

3" Scale

FIG. 294.

solid. The drawing (Figs. 294 and 295) is self-explanatory, and the method of construction does not need to be fully dwelt upon.

The total height of this skirting was 13½ in. The point to be noticed is that the ogee shown in Fig. 295 was continued round the base block, as will be seen by referring to Fig. 267, and comparing the two drawings. Also by comparison of these drawings it will be noted that the scotia under the base moulding occurs on the same horizontal line as the scotia at the top of the base block, and immediately under the return architrave

3" Scale

FIG. 295.

moulding; however the skirting moulding is not scribed into the scotia of the base block, but simply abuts against the capping of the architrave. In regard to the fixing of this skirting, it will be readily seen that the base moulding must be put around the room first; this will be done just as described in other cases which have preceded, then from the construction it is seen that the upper plinth is next fixed, then the bottom, and, last of all, the ogee moulding. Let it be carefully noted that the space left for the ogee moulding must be very

3" Scale

FIG. 296.

exact, seeing that it fits into the groove in the lower plinth, and the rebate formed for its reception in the bottom part of the upper plinth. There should be a good joint along the upper edge of the ogee moulding. If the upper edge of the ogee is bevelled slightly to the inside, and the tongue of its bottom edge left slack, there will

be no difficulty in getting this moulding into its place.

When, as in this case, the skirting is to be polished or varnished, it is desirable that the fixing should be done with needle points, so as to make the smallest holes possible to be stopped in the process of decorating. Most varieties of skirting have been dealt with now. Fig. 260 gave an illustration of an architrave in which the moulding of its outer edge is the same as that which occurs on the skirting, and hence the moulding of both intersects, seeing that architrave and skirting are in the same plane, and so as to show the continuation of the moulding, along the skirting, up the architrave, along the architrave head, down the architrave of the other side, and on round the skirting, and wherever it is possible to continue this moulding it is continued.

Fig. 296 gives a section and elevation of skirting and architrave to show the arrangement of mitring where the skirting and architrave intersect. It hardly seems necessary to state that if richness, ornateness, or variety is required in the skirting, it may be obtained by introducing various coloured timbers, either to contrast, match, or anything else that may be needed.

Sufficient has now been said upon this subject. The workman will be able to adopt from the specimens illustrated what will suit anything which may be called for. In concluding this article the reader should know that for the deeper kinds of skirting framed grounds are sometimes used. These are formed of parallel rails and cross-pieces, occurring at intervals of from 2ft. to 3ft., mortised and tenoned together. They might be spoken of as skeleton framing, and it is usually 1 in. or 1½ in. thick.

This is only done where the work is of a superior class.

A. C. SKILLING.

ROGERS'S PATENT SELF-ACTING AND VENTILATING SASH FASTENER.

THIS fastener, as will be seen by the sketch, consists of a metal toothed rack, affixed to

the upper sash, with which the detent or cam-catch on the lower sash engages at any height or degree of aperture desired, both of upper and lower sashes. The arrangement firmly holds the sashes safe and stable in any position required for ventilation, and cannot be opened from the outside.

BOOKS RECEIVED.

Archæologia Oxoniensis, Part I. (Oxford: High-street; London: Henry Frowde, Amen-corner).—"Prehistoric Oxford," by C. W. C. OMAN, is the first article in this new work on the antiquities of Oxford, in which the author gives an interesting account of the various "finds," and challenges the opinion that there is no evidence of British occupation on the site of the city, or that any settlement of importance existed. Attention is drawn to late discoveries in North Oxford, where British interments have been found. Roman coins, gold rings, pottery, and other remains are to be seen in the

Ashmolean Museum, proving the existence of British and Roman-British occupation long before the Saxon era. The author gives a map of the finds, including many remarkable interment remains, as those of the Roman vase from Mansfield College foundations, and a large fluted ovoid pot found in New Inn Hall-street. The New Schools discoveries, or pit dwellings, on the site of those buildings in the High-street, is the subject of another paper. A third paper of interest is contributed by Mr. J. P. Harrison on "The Pre-Norman Clerestory Window and other Early Work Discovered in Christchurch Cathedral."—*Linear Perspective*, by HENRY HODGE, B.A. (London: William Collins, Sons, and Company) is designed to meet the requirements of students preparing for the second grade examination of the Science and Art Department, and from a general glance at the principles and treatment of the book, and the problems given and illustrated, we should say that Mr. Hodge's book is well adapted for the purpose intended. The diagrams and solutions are clear and concisely stated. The method of obtaining perspective from a ground plan would have been a useful addition to the architectural student, and we confess the methods and examples savour a little too much of the Department and its system. The examples of buildings might have been improved, and show a little more architectural propriety; while many of the problems set by the S. and A. Department, such as cylinders piled on prisms, cones piercing parallelepipeds, and other unusual combinations of objects, would have been better replaced by forms of objects and features of buildings which are more frequently required in architectural drawings and landscape. The book is well printed, and is published at the very reasonable price of 2s.

CHIPS.

Lord Rayleigh, Lord Lieutenant of Essex, opened on Wednesday new Grammar School buildings which have been built at Chelmsford, from designs by Mr. Henry A. Cheers, of Twickenham.

The annual conversazione of the Society of Arts took place on Wednesday evening at South Kensington Museum, and was largely attended. In the absence of the Attorney-General, the chairman of the Society, the guests were received by Sir Philip Cunliffe Owen and the members of the council. The whole of the courts and corridors of the ground-floor were opened, together with the galleries containing the Raphael cartoons, the Sheepshanks collection, the William Smith collection of water-colour drawings, the Dyce and Forster pictures, and the Chantrey Bequest.

Mr. Thomas Kidd has been appointed city engineer and sanitary inspector of Ripon.

The will of Mr. Lumb Stocks, R.A., line engraver, has been proved, the personality amounting to £37,000.

A fatal accident took place on Monday at Fettykil paper works, near Leslie, Fife. A single-span bridge is being constructed over the river Leven, on which part of the warehouse will stand, and this 12ft. span, which was finished last week, collapsed while the centre piece and scaffolding were being taken down. The river was running very high and strong, and five men were crushed to death or drowned, viz., Mr. William Gould, the manager of the mill, under whose supervision the work had been carried out; Robertson and Paul, workmen, and Galloway and Brunton, labourers.

Mr. Arnold Taylor conducted a Local Government inquiry at the Town-hall, Lancaster, on the 27th June, in respect of the application of the town council for power to borrow £42,590 for street improvements, new roads, fire brigade, market, baths, and other purposes, £15,000 for works of water supply, and £2,600 for extension of the municipal buildings.

In order to arrange a division of the businesses carried on under the styles of Rowson, Drew, and Co., and George Wright and Sons, the partnership existing between Mr. Thomas Drew, his son (Mr. Lewis Harry Drew), and his nephew (Mr. T. Drew Bear) was dissolved by mutual consent on the 30th ult. Mr. Drew and his son retain the bar iron, steel, hardware, and stove and range businesses, and will carry them on in the names of Rowson, Drew, and Co. and George Wright and Sons as heretofore, and will receive and pay all debts due to, and owing by, these firms. Mr. T. Drew Bear takes over the engineering department, which has always been under his management. Mr. Drew Bear has taken into partnership Mr. Frank Ransome, of Ipswich, and Mr. E. Hollis Perks, and the business will be carried on in the name of Drew Bear, Ransome, and Perks, at 71, Queen Victoria-street, E.C., and at the Works, Prince's Wharf, Lambeth, as before.

WANDSWORTH POLICE-COURT.—"GLENROY," FINCHLEY.—ALL SAINTS CHURCH, PENARTH.—INTERIORS OF MANSION AT PRINCE'S-GATE.—SCULPTURE AT THE ROYAL ACADEMY.—REFRESHMENT PAVILION AND GROUND-KEEPER'S LODGE, SHEFFIELD.

Our Illustrations.

WANDSWORTH POLICE-COURT.

THIS important police-court is to be used for the first time to-day, and to be known as the South-Western Court. The plan which we give, with the front elevation, among our accompanying plates, clearly shows the commodious arrangement of the court, with its waiting-rooms, various entrances, the offices, and also the necessary cells for prisoners of both sexes. Mr. J. Taylor, F.R.I.B.A., of H.M. Office of Works, is the architect. Messrs. Mowlem and Co., of Grosvenor Wharf, S.W., were the builders. The building has been erected on Lavender-hill, Clapham Junction. The principal front and return façade are of red brick, with Portland stone ground story and dressings, as well as the pediment over the main entrance. The cost of the work, including warming and lighting, has been about £14,000. Mr. W. Dyer was the clerk of the works.

"GLENROY," ETCHINGHAM PARK, FINCHLEY, N. The whole of the exterior brickwork to the ground-floor story has been built in red brick of a light colour; the first floor is rough-cast plastering, and the gables have been executed in half-timber work. The roof is covered with Broseley tiles of a stronger colour than the bricks. The builder is Mr. F. Voller, of Wood Green, N., and the architect is Mr. E. W. Poley, A.R.I.B.A., of 22, Surrey-street, Strand, W.C.

ALL SAINTS CHURCH, PENARTH, GLAMORGAN.

THIS church was built last year to take the place of a temporary iron structure which for many years has been the only church on the residential side of the town. The site for the present building, which is in the middle of a public garden of three acres, was given by Lord Windsor, who owns the ground on which Penarth stands, and who also generously contributed half the cost of the building. The church, which seats 600, is lofty in proportion internally, with arcades of five bays on each side of the nave, the columns and arches increasing in richness towards the east. The roof, which is continuous throughout the nave and chancel, is barrel-shaped, and in the chancel is decorated in colour. The walling externally is faced with Pennant stone in thin courses; the quoins and dressings internally and externally are Bath stone; the roofs are covered with Whitland Abbey slates.

The carving is by Mr. W. Clarke, of Llandaff. Mr. L. Purnell, of Cardiff, was the contractor, the contract price being £6,000. Messrs. J. P. Seddon and Carter are the architects. The drawings here reproduced are in the present Royal Academy Exhibition.

NO. XLIX. PRINCE'S GATE, KENSINGTON.

THESE photographs were taken in the drawing-rooms of this mansion, the residence of the late Mr. F. R. Leyland, the Liverpool merchant, before the house was dismantled for the recent great sale of Pre-Raphaelite and Early Italian pictures. The furniture and works of art are also shown in the views just as they were left by the owner. The celebrated "Peacock room," as the dining-room is called, was fitted up from designs by the late Mr. Jeykell, whose taste for Japanese design made him a name in connection with the adaptation of that style so fashionable a few years ago. After him Mr. James McNeil Whistler was employed to elaborate the room which he covered entirely with gold, patterned out in the squares of the leaf after a random manner, smearing the surface with blues and greens blended together as if by mere chance, thus obtaining an indefinite erudescence effect of gilding, clouded like aventurine, while the panels and framings of the doors, shutters, and cases of shelving are enhanced by imbrications of peacock's feathers and other devices. We thought the effect, at any rate, curious, and can well understand Jekyll's rage at the fine old Spanish leather, with which he hung the walls, and for which Mr. Leyland paid over £1,000, being thus covered with gilding to destroy the red flowers with which the leather was powdered, only to make it harmonise with the turquoise blue painting by Whistler of "La Princesse du Pays de Porcelaine," hung at the end of the room. The stone staircase in the hall of the house, with its balustrade of gilt bronze, came from Northumberland House at Charing Cross, and is of 18th-century date. Upstairs, and in the morning-room below, Mr. R. Norman Shaw, R.A., was employed. The three drawing-rooms or salons on the first floor communicate with each other, and between them Mr. Shaw contrived two costly screens made with folding gates, as seen in the upper view on the accompanying plate, with shaped pediments over the centres. The woodwork is executed in walnut, but the arcaded filling in the upper parts of the gates has posts of burnished brass with Ionic caps and scrolls between them. This work is said to have been suggested to Mr. Norman Shaw by the roof-loft screen from the Cathedral of Bar-le-Duc, now in the South Kensington Museum. These screens can be taken down and removed entirely when it is desired to throw the three rooms into one, as on the occasion of grand receptions. The lower view shows the west salon, which has a choice antique marble chimney-piece in it from Italy. Over this Mr. Shaw has designed a walnut arcade for the display of works of art. On either side of the fireplace hang two of Sandro Botticelli's famous paintings illustrating the story of "Nastagio degli Onesti" in the "Decameron" of Boccaccio, and which came from the collection of the Pucci family. The doors and woodwork of these apartments are by Mr. Shaw. All the ceilings are alike with walnut framings inclosing caissons of gilt arabesque design. The gas lantern pendants remind us of some in the Chinese rooms of the Pavilion at Brighton, filled as they are with ground glass. Electric light has been introduced above these at the springing of the fan vaulting. Both gas and electric light are governed by switches outside the rooms. The agents who have the property in hand are Messrs. Osborn and Mercer, of Albemarle-street, W.

SCULPTURE AT THE ROYAL ACADEMY.

THIS sheet illustrates some of the best works in the sculpture gallery at Burlington House this year. We have already published a photograph of the Shelley memorial for Oxford. Taking the present subjects in the order in which they occur on our plate, we have nothing but praise for Mr. Henry C. Fehr's "Favourites," which we spoke of favourably in our general notice of the sculpture at the Royal Academy some few weeks ago. The bright and graceful statuette called "Morning" next to it is by the same skillful hand. "Fate-led," by Mr. Albert Toft, occupies one of the places of honour in the lecture theatre as a dignified and pure figure entirely sculptural in treatment. Mr. Onslow Ford's bust of

the Right Hon. A. J. Balfour, M.P., the distinguished Leader of the House of Commons, is a fine likeness which at once commands recognition. The Gordon Memorial shield, likewise by Mr. Onslow Ford, A.R.A., is a chaste and exquisite work in silver very delicately detailed. The bust of "A Woman" in green bronze by Sig. Andrea C. Lucchesi is worthy of its title, emblematic of all that this simple name implies.

REFRESHMENT PAVILION AND PARK-KEEPER'S LODGE, ENDCLIFFE, SHEFFIELD.

THIS building, recently completed, occupies a site near the principal entrance to the Endcliffe Woods, one of the most beautiful public parks of Sheffield. It contains a refreshment-room, 26ft. long by 16ft. wide, with alcoves projecting from either end. An attendant's room adjoins, with kitchen, store-rooms, and cellars conveniently arranged. A park-keeper's lodge forms part of the building, but is self-contained, and comprises parlour, kitchen, and offices, with three bedrooms on first-floor. Public conveniences are provided for ladies and gentlemen, with distinct approaches. The interior of the refreshment-room is finished with a salt-glazed brick dado, having moulded plinth and capping courses, the upper part of walls being in red brick. The ceiling is in wood, with moulded ribs dividing it into panels, the upper part of the room being lighted by dormer windows. The fireplace has an open hearth and wrought-iron dog-grate, and is worked in blue Yorkshire stone. The floor is laid with marble mosaic of warm tone, which gives a cheerful effect to the interior. Externally the materials used are red-pressed bricks and stone dressings, the roofs being covered with red tiles. The deep verandah is a prominent feature, and gives light and shade to the design, and is of practical service as a shelter for the public. The whole of the works have been carried out by Messrs. Ash, Son, and Biggin, of Sheffield, at a cost of about £1,400, from the designs, and under the superintendence of the borough surveyor, Mr. Charles F. Wike, Mem.-Inst. C.E.

THIRTY THOUSAND VOLUMES.

MR. J. PASSMORE EDWARDS has recently promoted the Free Library movement by presenting to various libraries and institutions in operation, and others in the course of formation, 30,000 volumes of popular standard works. The number includes 1,000 to the Village Library Association of Yorkshire, 1,000 volumes to the Southampton Free Library, 1,000 volumes to Clubs and Libraries in Salisbury, 1,000 volumes to the Cobden Club and Institute, Kensal-road; 4,000 volumes to Town and Village Libraries and Convalescent Home in Cornwall, 1,000 volumes to the Bethnal-green Free Library, 1,000 volumes to the Victoria Hall, Waterloo-road; 1,000 volumes to the People's Palace, Mile End-road; 3,000 volumes to various hospitals, schools, and evening classes in London; also 3,500 to various workmen's, boys', and girls' clubs in London; 500 volumes to the Mortimer-street Free Library, 500 to the Marylebone Free Library, 500 to the Paddington Free Library, 500 to the Working Lads' Institute, Whitechapel, 500 to the Chiswick Library and Mission Hall, 1,000 to the Whitechapel Free Library, 1,000 to the Poplar Free Library, 1,000 to the Shoreditch Free Library, 1,000 to the Chelsea Polytechnic, 1,000 volumes each to the three Polytechnic Institutions for South London, and 1,000 to school children in East and West London.

CHIPS.

Mr. Arthur W. Smith, of Radcliffe, has been appointed surveyor to the local board of Ramsbottom, Lancs.

The Bishop of Chester consecrated on Saturday the church of St. Wenefrede, Bickley, near Malpas. The Marquis of Cholmondeley gave the site, and has erected the church, which is seated for 250 persons, at his own expense.

The name of Mr. Charles Parsons, architect and valuer, has been placed on the commission of the peace for the borough of Burnley, and that of Mr. William Huntington, timber merchant, of Ashford House, Scotford, on the commission for Lancaster.

Mr. Thomas Hutton, joiner, an old tradesman of Durham, who has sat for many years in the Durham city council as a member for the south ward, died suddenly on Saturday night at his residence, New Elvet, Durham. Deceased was 67 years of age.

GROUND KEEPER'S LODGE RECREATION-GROUND. CARBROOK · SHEFFIELD.

CHAS. F. WIKE C.E. ARCHT.

BOROUGH-SURVEYOR · SHEFFIELD.

PLAN

GROUND-KEEPER'S LODGE, CARBROOK.

A PIECE of land at Carbrook, about $4\frac{1}{2}$ acres in extent, to the north-east of Sheffield, has been laid out as a recreation-ground, having gymnastic apparatus, swings, &c. The lodge has a parlour, living-room, and kitchen on ground-floor, with yard and offices and cellars in basement on first-floor; there are three bedrooms. The walls are of red brick, the windows being in wood, with moulded bars, &c.; roofs covered with slate, with tile ridges. Mr. J. Martin, of Sheffield, carried out the work at a cost of £430. Mr. Charles F. Wike, M.I.C.E., borough surveyor, Sheffield, prepared the design and superintended the building.

AUTOGRAPH ARCHITECTURAL DRAWINGS OF THE ENGLISH RENAISSANCE.

THE collection of architectural drawings by Palladio and Inigo Jones, now on view at the Royal Institute of British Architects, in Conduit-street, W., are unquestionably of considerable interest. They formed part of the series originally obtained by the celebrated Earl of Burlington, and are now owned by the Duke of Devonshire. For many years these drawings have been kept at Chiswick House; but as that historic villa is now being converted into a private asylum for Dr. Tuke's patients, the collection will ultimately be forwarded to Chatsworth. The drawings, of course, as specimens of draughtsmanship, compared with the productions of architects nowadays, are rough and out of perspective; but they are undoubtedly marked by an artistic handling of the pen, and force of intention on the part of the designer, who not infrequently, however, permitted his fancy to run riot in the exuberance of his detail and love of the picturesque. We reproduced some of these same drawings in the BUILDING NEWS for Jan. 30, 1885, when they were

shown in connection with the Exhibition of Architectural Drawings held then in the galleries of the Institute on the occasion of Mr. Maurice B. Adams's lecture on this subject. Kent helped Lord Burlington in the production of the volume of Inigo's Jones's drawings, which was published early last century. For this work all the originals were, however, redrawn, and much of their character was consequently lost. The most interesting studies to the architect now on view are those of sundry chimneypiece designs for several houses in different parts of the country. Some of the drawings are of old foreign buildings in Denmark and Italy, indicating proposed restorations and the like. By far the greater number of the sketches shown, however, are for stage-play scenery, and for actors' dresses, which Inigo Jones had to arrange as Master of the Court revels, and in this capacity he contrived many curious and wild conceits for stage displays, showing a brilliant imagination no doubt, but hardly worthy of his greater powers as a serious architect. Living under so flippant a master as James I., Jones often had much to discourage him; but his drawings as here seen were made chiefly, no doubt, when he enjoyed the smile of Royal favour, and endeavoured to realise the extravagant ideas of the court in which he was engaged after his second journey to Italy.

HYGIENIC CONGRESS AT PORTSMOUTH.

THE thirteenth congress of the Sanitary Institute will be held at Portsmouth from the 12th to the 17th September next. As in former years, the congress will be divided into three sections, each commencing on a different day. On Monday, Sept. 12, the proceedings will be opened with a reception by the mayor, to be followed by the inaugural address by the President, Sir Chas. A. Cameron; and in the evening an exhibition will be opened by the mayor in the

drill-hall. On Tuesday, the 13th, there will be five conferences—of municipal and county engineers, presided over by Mr. H. Percy Boulnois; of medical officers of health, and of naval and military hygienists, who may be expected to muster in force at such a centre as Portsmouth; of inspectors of nuisances, and one of ladies on domestic hygiene, the latter to be presided over by the mayoress. On the Wednesday, the 14th, Section I., "Sanitary Science and Preventive Medicine," will meet; and on Thursday, the 15th, Section II., "Engineering and Architecture," will be opened by an address by the President, Mr. James Lemon, M.Inst.C.E., F.R.I.B.A., the Mayor of Southampton. On Friday, Section III., "Chemistry, Meteorology, and Geology," will meet, Dr. W. J. Russell being the President; and in the evening an address to the working classes will be given by Dr. W. H. Corfield. Among the vice-presidents of the congress is Mr. A. Waterhouse, R.A., and the council include such well-known architects as Messrs. Arthur Cates, T. W. Cutler, H. Saxon Snell, and Ernest Turner.

A blue limestone cross of Early Celtic type has this week been placed over the grave of the Rev. George Taaffe at Collon, Co. Louth. The cross has a total height of 16ft.; the base is covered with interlaced ornament, the shaft is divided into panels, and the bosses on the arms bear the shamrock leaf. Mr. J. Gibney, of Drogheda, was the sculptor.

The corner-stone of a new Roman Catholic school in connection with the Church of the Immaculate Conception, Penzance, was laid on Tuesday week. The building will consist of a single story, and will accommodate 100 children. The whole will be built of Castle-an-Dinas stone, with granite dressings. The architect is Mr. Oliver Caldwell, F.R.I.B.A., and the building contracts have been taken by Messrs. W. H. Trounson (carpenter) and Alfred Trythall (mason). The cost will be £1,000.

REFRESHMENT PAVILION AND LODGE: ENDCLIFFE WOODS, SHEFFIELD.

WAYSIDE NOTES.

HAVING thus far survived all "perils of the seas, perils of rivers, perils of navigation," I am in a position to continue my remarks upon the course of my pilgrimage round England, for by the time—all going well—that I return by way of the East Coast I shall have circumnavigated the country, the length and breadth of my wanderings in Scotland alone excepted. Scarcely had I consigned my last communication to the postal authorities at Waterford, than I repented me of the statement as to the lack of the interesting in that particular corner of Ould Ireland. There remaining some couple of hours or so before our good ship left for Glasgow, I essayed to climb the hills across the water and over against the town. Therefrom appeared a most beautiful view of rolling green countryside, with a bold sweep of the river Suir, while in the background appeared mountain-tops of that strangely beautiful blue peculiar to Ireland. So, at least, I was given to understand—and so, in truth, I discovered; the humidity of the climate apparently giving atmospheric effects quite unique. Certain it is that though for some days I have beheld Scotch mountains afar off and near at hand, and have clambered up 2,745ft. to the summit of Ben Ledi, into and above cloudland, I have seen no such beautiful blue as seemingly pertains to distant mountains in the South of Ireland. I see a distant height over the brow of some hills, out of the window, as I write, but it is as a cold grey, wholly unlike the blue to which I have referred.

It was pleasant steaming northwards, with the Irish coast on the west of us. The Wicklow mountains are most picturesquely disposed, and look wild and forbidding in the distance, across an Atlantic-grey sea, the clouds hanging about their summits, and curling over into the valleys. Speedy as is the *Pladda*, whilst steaming round the coast of Wicklow at some miles from the shore, it seems to take a long while to completely change the scene we behold across the waters. So it happened that, returning from the tea-table, we were still, apparently, opposite the Wicklow Mountains, though the evening had advanced and the sun was setting behind their broken, purple outlines, to the south, lost in masses of grey storm-clouds, and to the north relieved with a glowing crimson background.

I immensely regret that at Greenock, instead of waiting the few hours the steamer had to stay, I followed the general rush for a train to Glasgow. Thus I have missed a review of the shipping industry, and left unseen the mighty new vessels that I am told the Cunard Company are building on the Clyde with the object of cutting down the voyage across the Atlantic to some five days or so, and "licking creation." Two big steel ships are on the stocks at Greenock, and a noisy, busy scene it is—one continuous roar and crash of riveting. By good fortune I beheld the P. and O. Company's new *Himalaya* lying alongside the wharf, and she is a very fine vessel. By the bye, going down Channel we passed a large liner at night, every porthole glowing with the electric light. The ship's coloured lights, the masthead light, and diverse brilliant lamps elsewhere on the vessel made up a something fairy-like, more easily to be imagined than described. The electric light on board ship is a grand thing, as I found by experience on the *Pladda*. It is convenient to be able to put out one's hand whilst lying in a berth and switch on the light.

The Glasgow Municipal Buildings received early attention. It is a magnificent building, creditable to all concerned. The marble staircase is very beautiful. Perchance the stone here and there employed does not harmonise with the other materials. Where so much marble is used one looks for a complete exclusion of all other materials. Anyhow, the conception is very fine, and the execution irreproachable. So, too, the suite of reception-rooms are as fine as anything hitherto attempted in the way of municipal architecture. I like the general aspect of Mr. William Young's exterior.

I saw no works of restoration in progress at Glasgow Cathedral. Here, at Dunblane, much has been done, and one of the choir aisles is now being roofed. This is a very magnificent building. The west front is fine, and the little leaf-shaped west gable window deserves all that has been said about it. Mr. Ruskin was, I

believe much taken with its beauty. I have never seen such a mass of mouldings as that round the archivolts of the west door. It is in six orders, and, without counting small secondary mouldings, there seems to be some fifty hollows and projections.

I have well "done" Loch Lomond, the Trossachs, and Lochs Katrine and Vennachar. After one more run in the Highlands, I hope to see "Auld Reekie," and then home. I do not, however, intend to miss seeing the Forth Bridge, which yet attracts great attention, and "draws crowds." It has struck me that the promoters of the bridge did well in making it a wonderful construction; the mere work itself creating a traffic in sight-seers over and above regular business. GOTH.

THE SOCIETY OF ARCHITECTS' VISIT TO FRANCE.

THE Society of Architects will follow up its interesting and successful excursion to Belgium last year by a visit to France this, starting on Friday, August 19th. Train leaves London (Waterloo Station) at 9.45 p.m. Boat leaves Southampton at 12.0 midnight.

The following is the programme, subject to revision:—

SATURDAY, Aug. 20.—8.30 a.m., breakfast at Grand Hotel de Normandie, 166, Rue de Paris, Havre. 10.30 a.m., visit Hotel de Ville. 12.23 p.m., leave Havre for Rouen. 2.3 p.m., arrive at Rouen. 2.30 p.m., lunch at Grand Hotel de France, Rue des Canes, Rouen. 4.0 p.m., visit Cathedral (12-16 cys). 7.30 p.m., dinner at Grand Hotel de France. Sleep at Grand Hotel de France.

SUNDAY, Aug. 21.—9.0 a.m., breakfast at Grand Hotel de France. 2.0 p.m., lunch at Grand Hotel de France. 7.30 p.m., dinner at Grand Hotel de France. English Church Services at 11 a.m. and 3.30 p.m., at the Church of All Saints, Ile Lacroix. Sleep at Grand Hotel de France.

MONDAY, Aug. 22.—8.30 a.m., breakfast at Grand Hotel de France, Rouen. 10.30 a.m., visit church of St. Ouen (14-18 cys). 1.30 p.m., lunch at Grand Hotel de France. Sketching in afternoon. 7.30 p.m., dinner at Grand Hotel de France. Sleep at Grand Hotel de France. (Note: Other places worth seeing are the Palais de Justice, the Hotel de Ville, the Churches of St. Patrice, St. Godard, St. Gervais, St. Mallon, and St. Laurent, and the old Streets of Epicerie and Grosse Horloge.)

TUESDAY, Aug. 23.—8.30 a.m., breakfast at Grand Hotel de France. Sketching in morning. 12.30 p.m., lunch at Grand Hotel de France. 2.9 p.m., leave Rouen for Paris. 4.35 p.m., arrive at Paris (Rue St. Lazare). 7.30 p.m., dinner at Hotel de Lille et d'Albion, 223, Rue St. Honoré, Paris. Sleep at Hotel de Lille et d'Albion.

WEDNESDAY, Aug. 24.—8.30 a.m., breakfast at Hotel de Lille et d'Albion. 10.30 a.m., visit Cathedral de Notre Dame. 12.0 noon, visit church of Sainte Chapelle. 1.30 p.m., lunch at Hotel de Lille et d'Albion. 3.30 p.m., visit Hotel de Ville. 7.30 p.m., dinner at Hotel de Lille et d'Albion. Sleep at Hotel de Lille et d'Albion.

THURSDAY, Aug. 25th.—8.30 a.m., breakfast at Hotel de Lille et d'Albion. 10.30 a.m., visit the Louvre. 1.30 p.m., lunch at Hotel de Lille et d'Albion. 3.30 p.m., visit the Pantheon. 7.30 p.m., dinner at Hotel de Lille et d'Albion. Sleep at Hotel de Lille et d'Albion.

FRIDAY, Aug. 26.—8.30 a.m., breakfast at Hotel de Lille et d'Albion. 10.30 a.m., visit the Opera House. 1.0 p.m., members joining the party for the first week only, leave Paris (Rue St. Lazare) for London, via Havre. 1.30 p.m., lunch at Hotel de Lille et d'Albion. 3.30 p.m., visit the Church of the Madeleine. 7.30 p.m., dinner at Hotel de Lille et d'Albion. Sleep at Hotel de Lille et d'Albion. 9.45 p.m., members joining the party for the second week only, leave London (Waterloo) for Paris, via Havre. They are recommended to leave Havre at 12.23 p.m. on Saturday, Aug. 27, arriving at Paris (St. Lazare) at 4.35 p.m.

SATURDAY, Aug. 27.—8.30 a.m., breakfast at Hotel de Lille et d'Albion. 9.55 a.m., leave Paris (Rue de Dunkerque) for Chantilly. 10.35 a.m., arrive at Chantilly. Visit Chateau. 1.30 p.m., lunch at Hotel d'Angleterre, Chantilly. Sketching in afternoon. 5.35 p.m., leave Chantilly for Paris. 6.25 p.m., arrive at Paris. 7.30 p.m., dine at Hotel de Lille et d'Albion. Sleep at Hotel de Lille et d'Albion.

SUNDAY, Aug. 28.—9.0 a.m., Breakfast at Hotel de Lille et d'Albion. 2.0 p.m., lunch at Hotel de Lille et d'Albion. 7.30 p.m., dinner at Hotel de Lille et d'Albion. English Church Services: St. George's, Rue des Bassins, 8.30, 10.30, and 7.30; English Church, Rue d'Agnesseau, 11.0, 3.30, and 8.0. Sleep at Hotel de Lille et d'Albion.

MONDAY, Aug. 29.—7.0 a.m., breakfast at Hotel de Lille et d'Albion. 8.20 a.m., leave Paris for Evreux. 10.31 a.m., arrive at Evreux, visit Cathedral. 1. p.m., lunch at Hotel, Evreux. 2.20 p.m., leave Evreux for Lisieux. 4.31 p.m., arrive at Lisieux. 7.30 p.m., dinner at Hotel de France, Lisieux. Sleep at Hotel de France.

TUESDAY, Aug. 30.—8.30 a.m., Breakfast at Hotel de France. 10.30 a.m., visit Cathedral (1045). 1.30 p.m., lunch at Hotel de France. Walk to Mesnil Guillaume Chateau, three miles from Lisieux. 7.30 p.m., dinner at Hotel de France. Sleep at Hotel de France.

WEDNESDAY, Aug. 31.—8.30 a.m., breakfast at Hotel de France. Sketching in morning—many old houses are worth visiting. 12.32 p.m., leave Lisieux for Caen. 1.28 p.m., arrive at Caen. 2.0 p.m., lunch at Hotel d'Angleterre, Caen. 3.30 p.m., visit Cathedral of St. Etienne (Abbaye aux Hommes, 1074). 7.30 p.m., dinner at Hotel d'Angleterre. Sleep at Hotel d'Angleterre.

THURSDAY, Sept. 1.—8.30 a.m., breakfast at Hotel d'Angleterre. 10.30 p.m., visit Church of La Trinite (Abbaye aux Dames). 1.30 p.m., lunch at Hotel d'Angleterre. Sketching in afternoon. (Note: Other places worth visiting are the Churches of St. Jean, St.

Sauveur, and St. Pierre, the University (1417-1450), Old Walls, Palace of the Bishop of Bayeux, and the Hotel de Thau. Short excursions can be made to the Quarries (two miles), and the Abbey d'Ardenne (six miles). 7.30 p.m., dinner at Hotel d'Angleterre. Sleep at Hotel d'Angleterre.

FRIDAY, Sep. 2.—8.30 a.m., breakfast at Hotel d'Angleterre. 12.0 p.m., lunch. 4.30 p.m., dinner. 6.58 p.m., leave Caen for Cherbourg. 10.26 p.m., arrive Cherbourg. 11.30 p.m., boat leaves Cherbourg for Southampton.

SATURDAY, Sep. 3.—8.45 a.m., leave Southampton. 10.40 a.m., arrive London (Waterloo).

Tickets for the excursion must be obtained from the Secretaries on or before August 1st, and applications for them must be accompanied by remittances at the following rates:—For the whole tour, according to this programme, £15; for the first portion, returning August 26th, £9 10s.; for the second portion, starting August 26th, £10 10s.

Each member will be entitled to introduce one friend (lady or gentleman), whose name and address, and, if a gentleman, whose profession, must be stated when application is made for his ticket, and such application shall be subject to the Council's veto.

These rates include travelling (first class between London and Paris via Havre; second class between Paris and Chantilly and Paris and Cherbourg; and first class from Cherbourg to London), and hotel expenses, portage, sight-seeing fees, and the expenses of a conductor, but not beer, wines, or spirits. Two beds will be placed in each room, therefore Members who may wish to be companions are requested to mention this fact when taking tickets.

Members are requested to encumber themselves with as little luggage as possible.

Arrangements will be made for washing linen at Paris. It will be found advisable to carry soap, as it is never provided at French hotels.

Members are requested to label their luggage each day carefully, and to look after it themselves, although all necessary portage will be provided, and everything possible done to prevent mishap.

OBITUARY.

THE death is announced of Mr. J. E. Jackson, builder, and in later years an architect, of 33, Park-place, Cardiff, which took place on Friday at Tredelech, near Cardiff, the residence of his son-in-law, Mr. Lascelles Carr. The deceased was born in 1817 at Monmouth, where his father, who was the son of an Edinburgh surveyor, had occupied a very prominent position, both in his business as a builder and as a politician. Educated at Monmouth Grammar School, on leaving it, in 1834, Mr. Jackson became engaged in his father's business, and his early manhood was occupied in the restoration of many of the interesting parish churches of Monmouthshire and the adjoining counties. While so engaged he was—says the *South Wales Daily News*—brought into close and frequent contact with the late Sir Gilbert Scott, Mr. G. E. Street, and Mr. M. and Sir J. D. Wyatt. He was a "craftsman-architect" of the old school, as distinguished from the professional architect. As a craftsman-architect, Mr. Jackson not only designed his buildings, but constructed them also with marked success. He came to settle in Cardiff thirty years ago, at a time when Cardiff, even in its most important streets, possessed but few buildings of any importance, and he was one of the first to bring private enterprise to bear in rearing edifices in Cardiff which may be compared not unfavourably with the buildings of the most important towns in the provinces, and to his enterprise and skill Cardiff is very largely indebted for much of the improvement which has been effected in its street architecture during the past quarter of a century. Mr. Jackson married Mary, third daughter of Edward Lucas Bass, of Monmouth, and two years ago Mr. and Mrs. Jackson celebrated their golden wedding at their residence, Park-place, Cardiff. Besides his widow, he leaves one son, Mr. C. J. Jackson, barrister, of Cardiff, and two daughters, both married.

Mr. John Shaw, cabinet-maker, of West Derby, Liverpool, died on Saturday, at an advanced age, in that city. The late Mr. Shaw was perhaps most widely known from the active interest he had taken during the past thirty years or more in public affairs. He was at one time a prominent figure at important public meetings, and was more recently an active member of the Liverpool Burial Board, West Derby Waste Land Commissioners, and other local bodies.

FILTERING WATER.—II.

In making any description of brick-built filter (or it may be made with concrete walls and bottom), it is requisite that the walls and bottom be puddled outside with clay. Water will only too readily find its way through brickwork and even concrete, and it is not so much water passing out of the filter that has to be guarded against as the possible liquid inflow. Clay is practically impervious to water; but, to make quite sure, if the clay is very wet, it is worked or puddled to express some of the liquid it holds, and to make it more consistent or dense.

In dealing with roof-water, it can be readily understood that the first part of this rainfall washes many objectionable matters down through the gutters, and until the introduction of the somewhat modern "separators," this first washing of the roof was a feature difficult to deal with. The "rain-water separators" that can now be obtained act very well, and their action is to divert the first two or three minutes' fall into the drains or elsewhere; but after this quantity has passed a movement occurs in the mechanism which sends the water through a different outlet, which leads to the storage tanks. By this means a very good water is obtainable with little trouble, the gutters only requiring to be freed from leaves and general debris somewhat frequently. In a general way this water may be used without filtration, but it is necessary in the autumn to keep the gutters as free from leaves as possible (assuming there are trees near by), as the foliage of different trees have characteristics of their own: oak leaves, for instance, if soaked in water, impart tannic acid.

If roof water requires any filtration at all, it is usually considered that sand is sufficient, or, better still, let the water be filtered through porous stoneware. In many forms of modern filters porous stoneware forms a conspicuous part. It is really unglazed pottery-ware as a rule, and obtainable in different forms from any well-known pottery factors. Its pores are so minute as to bar the passage of everything except what exists in an actually fluid form. Coloured liquids, however fluid their colouring matter may appear to be, usually arrive colourless on the other side. Impurities penetrate such a short distance that the cleaning of the material is effected by scrubbing with a brush. Should there, however, be a doubt, then assurance can be gained by boiling and scraping the stoneware if its size will permit. It will be understood that the passage of water through such a dense material as this is necessarily slow, and the action in this case, as with sand, is purely mechanical. The stone will not arrest impurities of a gaseous or strictly liquid nature by any attractive property as we experience with animal carbon. A filter that is made with a porous-pot filled with loose carbon stands decidedly high in the standard of efficiency. As a last reference to roof-water, it has to be pointed out that the few remarks made are intended to apply to roofs formed of materials that are not deleterious to health. A roof with copper or lead sheathing would introduce objectionable features, so would roofs that are treated with certain paint materials. The same remarks apply to the materials of the gutters, &c. It must always be remembered that in dealing with rain-water, very different results may be obtained to what are experienced with well-waters. Rain-water is soft—very so; and soft-water has a very vigorous action upon many substances. Its action upon lead has in several cases been sufficient to bring about epidemics of lead-poisoning in districts where soft-water has been distributed through lead pipes, or stored in lead-lined cisterns. Hard-water, water having lime (chalk) in solution, acts very differently; in fact, it, in a measure, has a preservative effect.

We can now speak of materials which not only act merely as strainers to arrest impurities, but have an attractive or absorbent power, an inclination to arrest impurities that merely come in contact, or come within their influence. The material that needs to come first is animal carbon, a charcoal obtained by subjecting bones to a high temperature in a closed space, practically the same means that is adopted to convert wood into charcoal. Now, although wood and animal carbons are prepared in a similar manner, they differ very greatly in their capabilities of filtration. Wood charcoal will act as a strainer, by arresting solid impurities that are too large to pass through its minute pores; but this is about

all it will do. It is almost inert as regards deodorising or dealing with gaseous impurities. On the other hand, animal carbon has a most pronounced and active effect in this direction. There is hardly a single cause of impurity that this substance will not deal with. If we have in water organic or colouring matters in a fine state of division, or in a fluid state, sufficient to permit their passing through the minute pores of charcoal, so far as the straining qualities of the material is concerned; still, these matters or fluids would be arrested by animal carbon. Undoubtedly the action is that of attraction, for there are other ways of ascertaining that carbon of this kind will deal with impurities under different conditions, and it always seems to act as if it were a collecting place for foul materials. All this goes to show that animal carbon really excels as a purifying material in filtration works, but, like many other tolerably perfect things, it has its failings. In the first place, it is merely a collecting place for foul materials, as just stated; it simply stores them up, and, as explained with sand, it is not long before the collection becomes a very unsuitable mass to pass water through at all. It will be understood that as the impurities go on collecting, they choke up the pores in the charcoal, and the good and active qualities we seek for are destroyed for the time being. Further than this, it is openly asserted by most authorities that this ordinary description of bone carbon is positively favourable to a low form of life when once the necessary impure matter is collected within its pores. By this is meant that when foul matter has collected or begun to collect in the mass of the filtering material, the nature of the carbon goes to promote the formation of life, or what we may term the putrefying action of the impure substances.

This doubtless seems a very serious drawback to the use of animal carbon, notwithstanding its otherwise good character. It certainly is a fault, but not sufficient to put it entirely out of favour. It is largely used by many very good firms, and the writer uses it frequently. The fault is not so serious that it cannot be remedied with a moderate degree of ease, yet it is sufficiently serious to cause a deal of investigation to be made towards finding some substances, or combination of substances, that will act without this ill-feature, as will be explained directly.

The remedy for the trouble is to provide ample facilities for removing this filtering material periodically for cleaning purposes. This cleaning process is most essential, as will be understood, and the somewhat prevalent idea that filters (of all kinds) never require attention after once having been fitted up and got to work satisfactorily, is most erroneous. In fact, it is apt to prove highly dangerous, for there is no gainsaying the fact that a filter can get into such a condition that water passed through it would be more injurious to health than drinking the unfiltered water. There is a considerable difference of opinion as to how often animal carbon should be purified. Some authorities suggest every year; others have even suggested so short a time as a few weeks; but in a general way it is recommended that the charge of carbon be changed every six months. It is easy enough to see how different opinions upon this can be formed, for in no two cases can the degree of impurity of the water be alike, nor can the nature of the impurity be similar either. Six months cannot be regarded as a fixed period by any means; it will bear a deal of variation, according to the state of the water. Some waters vary in purity at different times of the year, and this has often to be considered.

The purifying of animal carbon is a somewhat inconvenient business, so much so that in many cases it is preferred to remove the foul charge and replace it with new, and in any case it is usually necessary to have two charges, as the foul one has to be sent to the manufactory to be purified. This form of carbon, in as good and perfect a quality as can be obtained, is to be purchased for 36s. per cwt., so it can be judged whether the carriage and other charges are worth paying on the fouled material. It is, of course, governed by the quantity and distance. The purifying is a re-carbonising process, a burning with exclusion of air. Previous to this the material is thoroughly washed and boiled to remove all foreign substances possible; otherwise to carbonise the dirt matter in the pores would only go to choke them. It would be thought that a good boiling would not only cleanse the carbon, but

quite destroy all germs, animalcules, and organisms that have life in the foul collection; but it is authoritatively asserted that water at boiling temperature will not wholly destroy this life, and the higher temperature of the carbonising process is absolutely necessary. It has been rather doubtfully asserted that even this is not sufficient, it having been thought on some occasions that carbon treated this way showed signs of life quicker afterwards than if quite new carbon were used.

The general arrangement when treating water that needs both sand and carbon filtration (for drinking purposes) is to keep the two kinds of filtration separate. The sand filtration is generally carried out in a filter pit or bed near the source of the water supply, so that the flow from one to the other is natural and needs no mechanical aid. From this filter bed the water passes into a reservoir of some kind. From this source it flows or is pumped to the different points required, for some purposes no further filtration being needed; but for cooking and general domestic and drinking purposes, the carbon filtration is arranged in the house cisterns or in an auxiliary cistern beside them. Carbon filters are sufficiently expensive to insure care being exercised not to treat more water than is really necessary, and this kind of filtration is done as immediately before the water is used as possible. There would be a loss, and not a gain, in allowing the water, which has been subjected to this final filtration, to rest and remain unused for any length of time.

Should it, under some circumstances, be desirable to pass the water through carbon immediately after the sand, then care must be devoted to arrange so that the carbon portion is sufficient and compact, yet not in such bulk, or so spread about as to be extravagant in material. The next paper will speak of materials introduced to overcome or minimise the failings that animal carbon has.

(To be continued.)

MASONRY RETAINING WALLS.

FOR low retaining walls of masonry, the recognised section is the trapezoidal form, as being the most economical for walls of ordinary height. A recent writer, Professor M. Merriam, has shown the conditions of economic construction, and has given a table showing the thicknesses for walls of a given height to sustain a level bank of earth whose angle of repose is 34°, and which weighs 100lb. to the cubic foot. The height of wall is taken at 18ft., and the weight of masonry as 150lb. per cubic foot. The well-known formula for vertical back is given—

$$P = \frac{1}{2} w h^2 \tan^2 (45 - \frac{1}{2} \phi),$$

The normal pressure P is found to be 5,690lb. when the back of wall is inclined forward at a batter of 2in. to the foot, or inclination to horizontal, $\theta = 99^\circ 28'$. Assuming a top thickness of wall of 1ft., and a base thickness of 9.5ft., the "cubic yards" column gives 3.50 as the quantity of masonry in one linear foot of wall. For a wall with vertical back, where $\theta = 90^\circ$, for the same top thickness and base thickness of 7.3, the cubic yards are tabulated at 2.77, and the earth pressure on P being 4,580lb.; so that it is evident the sections of vertical wall require less masonry than those with their backs with a forward batter, and that the wall, as a consequence, needs not to be so thick at the base. In another column of the same table, under "per cent.," is given the comparison with vertical rectangular walls, which is taken as 100. Thus, in the wall above mentioned with battered back, 67 per cent. is shown, and in the vertical wall only 53 per cent. The table shows walls of 2ft., 3ft., and other top thicknesses, by which the economic section may be obtained.

Owing to the curtailment of their Carr-street premises by an extensive scheme of street improvement, Messrs. Peils and Son, who have been established in Ipswich as builders for over half a century, have just erected a new range of workshops in Old Foundry-road, at the rear of their old works. The two chief workshops are of two floors each, one being 60ft. by 20ft., the other 30ft. by 17ft. A new chimney-shaft and offices have been erected, and an old steam mill on the opposite side of Old Foundry-road has been converted into stores and stables.

Building Intelligence.

ALDERSHOT.—Her Majesty the Queen laid, on Monday, the foundation-stone of the new Military Church of St. George in Stanhope Lines, South Camp. The building is of Early English character, the walls being in red bricks and the dressings in St. Aldhelm Box Ground stone from the quarries of the Bath Stone Firms, Limited, Bath. The contract is being carried out by Messrs. J. Dorey and Co., of Brentford, under the superintendence of Colonel Waller, Major Pitt, and Lieutenant Michie. When finished it will have a length of 169ft. and a width of 64ft., and is calculated to seat 1,012 people.

CHILWORTH.—The new Franciscan church and friary on Blackheath were opened on Thursday in last week. The building is in the Late Perpendicular style, of a very severe character. It is constructed of Ewhurst stone, with Chilmark stone facings, and the internal woodwork is of oak and Oregon pine. In addition to the high altar there are four side altars, which are chiefly of alabaster. There is accommodation in the friary for 26 members of the Order. The architect was Mr. Walters, F.S.A., of Westminster, and the contractors were Messrs. Longley and Sons, of Crawley.

COVENTRY.—New board schools are in course of erection in Priory-street. Viewed from that street, the building appears to be a two-story structure; but upon approaching it on the Wheatley-street and Cox-street sides it will be seen that the main portion is raised upon arcades and columns. Both sexes will be massed at the opening of school in the assembly-hall, and afterwards dismissed to the various classrooms—of which there are fourteen, seven for the boys and seven for girls—which open on all sides, for lessons. The infants' department is entirely separate from the other two. The large hall will be lighted by clerestory windows, and the timbers of the roof—pitch-pine, wrought and varnished—will be exposed to view. Private rooms are provided for the head teachers. The schools will be ventilated on the system of Messrs. Jackson and Son, of Birmingham. The architects are Messrs. G. and I. Steane; Mr. J. T. Winthrop is the contractor, and Mr. A. Davies is clerk of the works.

EDINBURGH.—The Drumsheugh Baths in Old Queensferry-road, which were recently destroyed by fire, are about to be reconstructed on the same site. It is intended to utilise the outer walls in the construction of the new building, which, when completed, will be similar in almost every respect to the old one. The new building will, however, be fireproof, the plans providing for a concrete floor over the engine-room, which is situated in one of the wings below the level of the large pond. The building is executed in the Moorish style, and finished in rough-cast with brick dressings. As the swimming-pond is situated some depth below the level of the street, the main entrance is on the third floor. Here is situated the club-master's office with vestibule, and descending to the next floor is the Turkish baths department. It comprises tepidarium, outer and inner caldarium, plunge bath, and dressing-rooms. On the lower floor is situated the swimming-pond, 70ft. by 35ft., a gymnasium, the washing-rooms and lavatories. The swimming-pond will be lighted by two lantern lights from the roof, and also by flat roof-lights over the galleries. The architects are Messrs. Burnet, Son, and Campbell, Glasgow; and the contract has been entrusted to Messrs. Beattie and Sons, Edinburgh. The reconstruction will cost £6,000.

GREAT CROSBY.—Dr. O'Reilly, Roman Catholic Bishop of Liverpool, on Sunday blessed and placed the foundation stone of the new church of SS. Peter and Paul, Great Crosby. It is Early English in style, designed by the firm of Messrs. Synott and Powell, architects, of Harrington-street, Liverpool, and will replace, at a cost of £6,000, the old church, to the rear of which it is being built by the sole contractor, Mr. Samuel Webster, of Bootle. It will seat 500 persons, and will consist of nave, with two side aisles and two side chapels, sacristy and organ-chamber, the eastern end terminating in an octagonal apse. The old presbytery has been demolished, and a new one will be built adjoining the church. The masonry will be executed by Mr. James McDermott, of Walton; and the brickwork by Messrs. Sawyers, of Waterloo.

LIVERPOOL.—The foundation stone of the new hospital in Smithdown-road, in connection with the Toxteth workhouse, was laid on Monday. The new hospital is to cost £25,799, the architects being Messrs. C. O. Ellison and Son, of Liverpool. The premises are arranged in blocks as follows:—1, the porter's lodge and reception and vagrants' wards; 2, hospital pavilions. 3, administration block; and 4, nurses' home. The hospital is arranged in seven two-story pavilions, running north and south, each with space all round, and approached by a 10ft. corridor, open on both sides. Of these pavilions, four only are included in the present contract. The first pavilion to the north consists of four wards, two for 18 and two for 16 beds each, with 8ft. wall space where required for special cases, and 6ft. for the others. Each of these wards is complete in itself, and has its own bath, lavatories, and entrance and airing court. The first pavilion to the south is for 64 beds, in two long wards for 30 each, and two wards for two each, with two day rooms at the south end. A kitchen is provided at the entrance end of each large ward. The large wards and the day rooms are separated by a light screen of pitch-pine and glass, and fronting the day rooms is an airing balcony, having a south aspect and special stairs. Three other large pavilions, one for 72 and two for 56 beds each, are provided for, but one only is to be built at present, together with one on the north side for 48 beds. The buildings are of ordinary brickwork with red bricks in prominent places, and red stone heads and sills. The entire work is being done under the supervision of the architects, Mr. Mather acting as clerk of works.

—St. Saviour's Church, Falkner-square, has recently undergone extensive alterations, the chancel having been entirely reconstructed and enlarged. The main walls of the church are painted in various shades of terracotta, which colour is repeated with pale buff on the front of the galleries and pulpit. The choir stalls are constructed of walnut on Classical lines. The chancel wall colouring, whilst being generally similar, is richer and of more warmth and luminosity than that applied to the nave. The panels of the dome are worked in a rich geometrical diaper, of which celestial blue is the prevailing colour, and are broken up by the introduction of seven circular panels, the central one, on which is painted the Saviour, being of glass. The remaining six will be filled with heads of the Apostles. These are being painted by Mr. W. H. Lonsdale, and are not yet completed. The whole forms a harmony in dull red, celestial blue, and gold, executed by Messrs. Shrigley and Hunt, of Lancaster.

MANCHESTER CATHEDRAL RESTORATION.—The finishing stroke of the present restoration of Manchester Cathedral, which has now been going on for some twelve years or more from plans by Mr. Crowther, the architect to the Dean and Chapter, has been commenced. This is the taking up of the entire flooring in the south aisle of the nave, forming what are known as the Trafford Chapel and Brown's Chapel, and lowering it to the same level as the floor of the nave. This is preparatory to the scheme for relaying the whole of the floor of the nave in diamond-shaped blocks of black and white marble. By the time this work is completed on the south side of the nave, it is anticipated that the new south porch and baptistry will also be completed, and the former south entrance, which has been closed for a considerable time, will be once more utilised.

SANDGATE.—The Beach Rocks Convalescent Home at Sandgate, connected with the London Samaritan Society, was opened on Saturday. The principal front faces the sea, and the terrace is approached from the beach by broad flights of steps. The entrance is from Sandgate High-street, the main thoroughfare from Folkestone to Hythe. The building has been erected by Messrs. Wallis and Sons, contractors, of Maidstone, from the designs of Messrs. J. Shaw and W. M. Dabbs, of London. The building and the furniture have cost in all about £20,000. It was the aim of the designer to get as much light and air within the building as possible. The porchway is fitted with bevelled plate-glass, and the same material is used for the inner doors and the screens, and also for the doors of the dining hall, which has large plate-glass windows looking out on to the sea. The home comprises a central block and two wings. It is constructed of red brick, with Portland stone dressings; the upper

story is rough cast, and the roof of Broseley tiles. The style may be described as Victorian Gothic. The floors of the corridor are covered with red tiles, herringboned, and with borders of black tiles. The dining hall is 50ft. by 28ft., and 20ft. from the floor to the ceiling, which is coved and panelled. At each end there is a tiled fireplace, with overmantels. The floors throughout the building are of herringboned wood blocks. The bedrooms contain altogether 250 beds.

SUNDERLAND.—The foundation stone of the new Sunderland and North Durham Eye Infirmary will be laid on Saturday (to-morrow). The building is two stories high, and provides accommodation for 16 in-patients in four wards, two each for males and females, each ward having separate w.c. and lavatory in a through-ventilated outshoot in direct communication with the ward. These, with two nurses' rooms, two bath-rooms (one for males and one for females), servants' bedroom, operating room (with north light, lavatory, and sink), and linen closets, occupy the whole of the first floor. Ample accommodation can be provided in the attics for nurses and servants. The style of the building is Domestic Queen Anne. It is faced with Grosmont red bricks, relieved by stringcourses of moulded red rubber bricks and massive stone cornice with dental blocks, and the roof is covered with Broseley tiles. The building is being erected from designs, and under the superintendence of Mr. J. Wardle Donald, A.R.I.B.A., of South Shields, by Messrs. D. and J. Ranken, of Sunderland, at a cost of £4,590, Mr. L. R. Todd being the clerk of works.

Engineering Notes.

PRESTON.—The Duke of Edinburgh opened, on Saturday, the Albert Edward Dock, constructed by the Preston Corporation. The entrance to the tidal basin is 90ft. wide at the Bullnose, and tapers to 66ft. at the outer tidal gates. Vessels entering the dock have to pass through the outer pair of tidal gates into the tidal basin of 4½ acres, in which basin the traffic will be marshalled. The total length of the tidal basin is 850ft., and the width 300ft., with a quayside of 560 lineal yards. The tidal basin is connected with the wet dock by a lock 550ft. in length and 66ft. in width, divided by intermediate gates into two compartments, one 325ft. long and the other 225ft. long, enabling vessels up to 225ft. to use the western lock, vessels over 225ft. and under 325ft. will use the eastern lock, while vessels over 325ft. will require the full length of the locks. The wet dock is 40 acres in extent. The dock sill is 38ft. below coping level, giving 29ft. of water at high water ordinary spring tides. The total length of dock is 3,020ft. by 600ft. wide, giving a quayside of 2,266 lineal yards. Entrances for two proposed graving docks 50ft. and 66ft. wide respectively have been put in at the south-west corner of the dock, and temporary dams put across the openings. An entrance has also been built at the north side of the dock for the proposed timber pond of 20 acres, to be formed at the west end of the old river course. One small warehouse, 200ft. by 50ft., has been erected, and there are 4,480 yards of permanent railway and sidings. The works were designed by Messrs. Garlick and Sykes, engineers, of Preston, and the engineers of the scheme submitted to Parliament were the late Sir John Coode and Mr. Benjamin Sykes, M.I.C.E., F.G.S. The works were commenced under the engineership of Mr. Edward Garlick, M.I.C.E., and on his retirement through ill-health were carried out to completion by his partner, Mr. Sykes, with Mr. T. G. Lumb, A.M.I.C.E., resident engineer, and Mr. Robert Sykes as assistant resident engineer. The original contract of £456,600 has been greatly exceeded owing to various causes, and the dock and river diversion have cost over one million sterling.

Important extensions are about to be carried out at George Watson's College for Boys, at Edinburgh, from plans by Messrs. McGibbon and Ross, of that city. They include the addition of a three-storied wing at each end of the present buildings in keeping with the existing main structure, and at the rear a new gymnasium, 70ft. by 50ft., and a workshop and laboratory will be provided.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

LIVERPOOL ENGINEERING SOCIETY.—On Saturday afternoon, Mr. J. H. Tudsbery Turner, B.Sc., M.Inst.C.E., who has been appointed assistant secretary of the Institute of Civil Engineers, London, was the recipient of service of plate subscribed for by members of the Liverpool Engineering Society, in recognition of his services as honorary secretary for the past five years. The presentation took place in the rooms of the United Service Club, Dale-street, Liverpool, and there was a large attendance, including Alderman J. T. Wood, C.C. (president), Mr. R. Johnston (president-elect), Mr. Percy Boulnois and Professor Hele-Shaw (vice-presidents). Alderman Wood made the presentation, and also presented Mrs. Turner with a diamond bracelet.

THE PROTECTION OF ANCIENT BUILDINGS.—The 15th annual meeting of the Society for the Protection of Ancient Buildings was held on Tuesday evening in the old hall of Barnard's Inn, Holborn. His Honour Judge Lushington presided, and in the course of his address said that the society was actuated by the modern historical spirit which desired to promote a care for, interest in, and study of the past, and piety towards the past. That was often done in a narrow parochial way; but it need not be so. Had the age in which we lived any real care for outward beauty or for the arts that echoed and illustrated that outward beauty, or for the historical associations that were often so very deeply bound up with ancient and beautiful monuments? He thought he would be a brave person who would claim praise for it in that respect. Let them think of the long lines of jerry-built houses and the loss of the race of art workmen disappearing from among us. Let anyone think of the immense difficulty under which architecture, painting, and sculpture were now being carried on among us. There had been a beautiful architecture in England, and a fine race of art workmen, and a great number of churches scattered up and down the land, so that there really had been opportunity for everyone to familiarise himself with beauty and dignity of work. Those churches which had been praised by the poets were the victims of our ignoble restoration. Mr. Reginald T. Blomfield, the next speaker, said that he thought the architects were the people who needed educating more than anyone else on this point, as they were the agents by whom the work of what was called restoration was performed. Mr. Hunter expressed the hope that the whole site of Christ's Hospital in Newgate-street would not be sold, and that a jealous eye might be kept upon it to prevent it from being devoted exclusively to building purposes. Mr. William Morris moved a vote of thanks to the chairman.

ARCHÆOLOGICAL.

THE TOWER OF LONDON.—A visit was paid to the Tower of London on Wednesday by the members of the London and Middlesex Archæological Society, when the various points of interest in connection with the buildings were described by Messrs. E. W. Brabrook, F.S.A., R. Chandler, E. Freshfield, jun., F.S.A., Major H. A. Joseph, Lieutenant-Colonel G. Lambert, F.S.A., T. Milbourn, E. W. Streeter, and A. White, F.S.A.

The Dudley collection of pictures fetched at the auction on Saturday £101,320. "The Crucifixion," by Raphael, went for 10,600 guineas, and "A View in Holland," by Hobbema and Van de Velde, 9,600 guineas.

Messrs. John Jameson and Son, Limited, of Dublin, are about to erect extensive spirit stores and other buildings. The constructional iron and steel work, also the fireproof floors and roofs, have been placed in the hands of Messrs. Homan and Rodgers, of Manchester and London.

A new public hall has been erected at Rhondda Valley, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

Mr. R. F. Dennis, town surveyor, West Cowes, has been instructed to prepare plans, &c., for an esplanade and sea-wall having a frontage of over 1,000ft., which is to form part of a scheme that will ultimately connect Gurnard with Cowes, via the shore, and at the same time provide an esplanade of over three-quarters of a mile in length along one of the most picturesque parts of the Solent.

COMPETITIONS.

GRAY'S INN.—An uncommonly uncanny-looking competition is on foot for the erection of a new chapel in Gray's Inn-gardens, on the site of the existing classrooms south of Raymond Buildings, by the benchers. "Gratuitous designs" are asked for, and no information can be given as to how the author of the chosen design is to be paid. No date is fixed for the reception of the plans, no scale is fixed for the drawings, no referee will be engaged, so far as can be ascertained, and it is optional as to whether the competitors fix mottoes or their names to their designs. The shadow of a friend already cut out for the work seems to throw a shade of doubt over the proceeding, and may well cause architects to mind how they proceed. Canvassing the benchers is not forbidden, in the conditions, at any rate, and all is fair, they say, in love and war. The cost is not to exceed £3,000, and the windows are to incorporate the old glass in the present chapel. This is another instance of how lawyers view a fair competition for architects.

OXFORD.—At last the award in the new Municipal Buildings competition has been confirmed by the town council, who, on Wednesday last, elected Mr. H. T. Hare, A.R.I.B.A., as architect for the work in accordance with the report of Mr. T. E. Colclutt, F.R.I.B.A., the referee. This design, marked by the figure 5, is the one which we unhesitatingly placed first when reviewing all the five competition designs in last week's BUILDING NEWS, and there can be no doubt that it is the best scheme both for plan as well as elevation of those submitted in the final contest. We congratulate both the corporation as well as the architect on the satisfactory result thus recorded. The sum stated to be expended is £60,000. We hope at an early date to be enabled to illustrate all of the designs, when our readers will be able to see for themselves the merits of the various schemes. The authors of the other plans are:—No. 2, Mr. James B. Hinks, Liverpool; No. 1, Charles Bell, F.R.I.B.A., London; No. 4, Mr. Ernest Runtz, London; and, No. 3, Messrs. Cheston and Perkin, London.

ROATH, CARDIFF.—Mr. William Bevan, architect, Cardiff, has been selected as the architect for the proposed Lady-chapel in St. Peter's Church, Roath. Local stone is proposed to be used for the walls, with freestone quoins. The chapel is provided with aisles, and will seat about 80 worshippers.

CHIPS.

The old burial-ground in the Hackney-road was opened on Tuesday as a public recreation ground. There is just one acre in this open space, and the laying out and planting cost the Public Gardens Association £150. The Earl of Meath mentioned that the Association had already spent £30,000 in laying out such open spaces for the enjoyment of the people.

An infants' school is about to be added at the side of St. Margaret's Church, Anfield, Liverpool, from plans by Messrs. Fry.

A tablet in memory of the late Dean Elliott has just been placed on the north wall of Bristol Cathedral. It is of white Italian marble, and is 5ft. 4in. high by 3ft. wide. Mr. T. Tiley, of Bristol, was the sculptor.

The Governors of the People's Palace for East London desire to hold an exhibition of pictures in the Queen's Hall from August 13 to September 10. A similar exhibition last year was visited by sixty thousand six hundred persons, principally of the working classes. The Governors appeal again for the loan of good pictures.

Mr. John Armitage, late of Sheffield, drain-pipe and fire-brick manufacturer, has left personalty amounting to £21,000.

The annual congress of archæological societies in union with the Society of Antiquaries is to be held on the 20th and 21st inst. On the former day the members of the congress will dine together, and Mr. Franks will hold a reception at Burlington House on the same evening. On the 21st the archæologists are to make an excursion to Silchester.

A Venetian glass vase has been manufactured by the artists engaged at Dr. Salvati's furnace at Olympia, for presentation to the Queen on the occasion of the anniversary of her Majesty's coronation day. The vase has been executed by Giuseppe Barovier, assisted by his brothers Pietro and Vittorio, and is their own gift, the work having been done in their spare time.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 80c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL, XLII, XLVII, XLIX, L, LI, LIII, LIV, LVIII, LIX, and LX, may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—W. R. T. and S. M. Co.—B. G. and Co.—Cantab.—J. R. S. (Norwich).—F. R.—Metropole.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Unitate Fortior," "St. Hughes," "Smilash the Goth," "Excelsior," "Supervision," "Wyandotte," "Black and White," "Ajax," "Vulcan," "Rotenberger," "Q. E. F.," "Cottager," "Yorkshire Tradition," "Black Prince," "Nemfardi," "B." in a circle, "Sweet Auburn," "Clansman," "Phoenix," "Sector."

ONE WHO NOTICED IT. (Technically you might be right, but we have to judge of the designs fairly all round, and have no doubt as to the correctness of our award.)

Correspondence.

ARCHITECTS' REGISTRATION BILL.

To the Editor of the BUILDING NEWS.

SIR,—As Parliamentary candidates are now in full working order with the general election close at hand, I think it would be wise for provincial, as well as London, architects who are in favour of registration to bestir themselves and see what support the candidates in their respective constituencies are prepared to give to this Bill, should they be returned to the House of Commons. Those who have interested themselves in any Government measure, no matter what its object may have been, know how very difficult it is to obtain the sympathy and promises of members safely seated in the House; and now that candidates are forced to show which way their sympathy lies, every architect, whether in practice or not, provided he has a vote, should seize this opportunity of furthering a cause which the majority of us have at heart, by asking candidates if they are prepared to support the Bill. So that they need not plead ignorance of its provisions, I should advise those who wish to do as I suggest to send to the Queen's printers (Eyre and Spottiswoode) for a copy of the Bill, which can be had for 4d., in-

cluding postage, and this they can place before their men.—I am, &c.,
JAMES W. FRAZER, A.R.I.B.A., M.S.A.
12, Grey-street, Newcastle-on-Tyne, June 29.

POPLAR LIBRARY COMPETITION.

SIR,—As you attribute to me the authorship of the designs marked "Height and Light," which you criticised so unfavourably in your last issue, I shall be obliged if you will correct the statement. You have been misinformed. I did not compete.—I am, &c.,
J. ELMSLY INGLIS.
9, Great Russell-street, Bloomsbury, June 28.

LAND SURVEYING.

SIR,—In reply to "Northman's" letter on p. 883, the scale of Fig. 5 is about $4\frac{1}{2}$ chains to an inch. AF is checked by DEF. If F were measured some distance out the effect would be to revolve DF about D, this would cause F and E to approach to or recede from D. This approach or recession would act in opposite ways on the two points, so that the effect on FE would be doubled and any error would be clearly seen. If F were 100 links out, it would be at once detected, as "Northman" can test by trying it; but I doubt whether he or anyone else could plot 5 links on this scale, as it amounts to only 1.95 of an inch. If BE were measured, as in practice it would be (the method of finding a point on a line given in Fig. 8 is only intended to be used when the marks on a line have been lost and the surveyor does not wish to rechain), any error would be located in its particular triangle as surely as in "Northman's" example. Perhaps the following order of plotting may make it clear to "Northman" that the position of F is checked. Lay down AB, set out C by means of AC and BC, mark F, set out D by means of FD and BD, then check the whole with CD. I have no wish to criticise "Northman's" construction, but he has offsets $1\frac{1}{2}$ chains long on AZ, and the checking of D and B depends upon CYZB appearing in the same straight line; in the event of BZ being wrongly chained, the error would be as difficult to detect as he claims any error in AF Fig. 5 would be; as a matter of fact, any error would be easily detected in either case. I shall be always pleased to have letters on any errors, real or imaginary, in the papers, as the discussion thereon cannot fail to elucidate an obscure point; but is it necessary to assume that because an error, real or imaginary, appears in one diagram all the others are worthless, and the author utterly inexperienced in surveying? In a letter by an anonymous writer, who does not mention his status or experience, a statement to the effect that he "never saw a square field measured in any other way" has two interpretations. G. W. COBHAM.
Gravesend, June 27.

R.I.B.A. EXAM.

SIR,—Allow me, as a candidate of the above, to say a few words as to the nature of a certain question given on the history of architecture in March last, so that I may enable intending candidates to judge as to the range and nature of knowledge they ought to possess on this subject. As far as I can remember, the question given at the exam. was:—"Describe and illustrate with sketches any English cathedral erected during the period selected by the candidate, except Westminster and Salisbury."

Such a question I, for one, cannot admire. It seems to me far more tricky than just, for why should two of our most noted buildings thus be excepted, and more especially without any previous notice to candidates, seeing it has never been done before. I do not think it gives much encouragement for the study of existing examples, because I, and no doubt many others who have had every facility for and have studied Salisbury for years, had unfortunately at the exam. no opportunity of touching upon this question or of showing the fruits of our well-spent time and money. On the other hand, I am led to believe that certain candidates who probably had not even seen a cathedral, but fortunately had, for the purposes of the exam., provided themselves with a brief description of one or two examples copied from books, accompanied with a few sketches, gave satisfaction to the examiner. Such being the case, a candidate in my opinion stands a far better chance of answering such a question as the above by providing himself with a few briefs and sketches from books on different

cathedrals, than if he were to go and measure, say, Lincoln Cathedral, for who can tell which building may be excepted at the exams. of the future?

It is true that a candidate ought to be able to describe more than one cathedral from memory, but I am afraid he cannot retain the intricacies and details belonging to many. Candidates are advised to study from an actual example, if possible; but it is not every one's good fortune to have such an opportunity. Therefore it is only natural under such advice for candidates who find Salisbury or Westminster conveniently situated for them, that they should set their mind on taking from these buildings all the information and sketches they may procure, and they may probably find, after doing so, that they have quite as much as they can comfortably retain for the purposes of the exam. on this subject without either spending time or money in studying another.

I should be pleased to hear the opinion of others on this question.—I am, &c., LINGTONIAN.

PARLIAMENTARY NOTES.

MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE RAILWAY.—Although, after an eight days' inquiry, the House of Lords Committee passed the preamble of the Bill promoted by the Manchester, Sheffield, and Lincolnshire Railway for the extension of their line from Annesley to London, the Royal Assent has not been given to it during the session just ended. Time did not admit of its being read a third time in the Lords, and referred back to the Commons with amendments. The final stages of the measure will be taken, therefore, in the new Parliament.

WATER SUPPLY AND SANITARY MATTERS.

WOODHALL SPA, LINCOLNSHIRE.—The Horncastle rural sanitary authority are considering a sewerage scheme for the above locality, and Mr. Herbert Walker, C.E., of Nottingham, has been instructed to prepare the necessary plans and report upon this question.

EDINBURGH.—A report has been prepared by a committee of the Edinburgh and District Water Trust with reference to the report recently submitted by the consulting engineers on the question of the water supply of the city. The three main recommendations are:—(1) That the Deacon meter should be more largely employed in the checking of waste; (2) that the Trust should apply to the sheriff for more power to regulate the water fittings; and (3) that the Trust should next year apply to Parliament for a Bill for the introduction of a new water supply.

WAKEFIELD.—The first sod of the new Withens reservoir, on the Rishworth Moors, in connection with the Wakefield new waterworks, was cut on Thursday, the 24th ult. The reservoir will have a capacity of 240,000,000 gallons. The works have been let to Mr. Oliver, of Horsham, Kent, and the cost is estimated at £120,000. Mr. H. Rofo, of London, is the engineer.

CHIPS.

A special meeting of the Shrewsbury town council was held on Monday, when plans were submitted by the borough surveyor for the new public baths, which formed the subject of a recent unfortunate competition, and which are to be constructed at a cost of £7,000, near the Quarry Grounds. The plans were unanimously approved.

The Bishop's Stortford local board have unanimously resolved to increase the salary of their surveyor, Mr. R. S. Scott, from £200 to £250 per annum.

Mr. R. A. Sheard has tendered his resignation as a member of the Liversedge Local Board as a protest against the board's selection of Mr. Gott, of Bradford, to carry out the Moorbottom sewerage scheme.

The West Ham Corporation have purchased the Essex Lodge Estate, of about seven acres, at Plaistow, for the purpose of a public park.

The memorial stones of a Wesleyan chapel, in course of erection at Glasfryn, Bangor, from the designs of Mr. W. Lloyd Jones, C.E., were laid on Friday last.

St. Augustine's Church, Solihull, the rebuilding of which in 1839 was the elder Pugin's first church work, is being redecorated under the supervision of Mr. F. A. Pippet. Two statues mounted on corbels have been executed and fixed by Mr. J. Roddis, the three memorial windows to the late Canon O'Sullivan, which are in the hands of Messrs. Hardman, are expected to be completed during this month.

Intercommunication.

QUESTIONS.

[10755]—**Warmington Church, Northants.**—Could any subscriber inform me as to where I can find a description, with longitudinal section and details, of this church? I have the plan and a few details, gathered from various sources; but should like it as complete as possible.—EARLY ENGLISH.

[10796]—**English Abbeys.**—At the exam. of the R.I.B.A. in March, 1891, the following question was given:—"Describe fully and illustrate by sketches one of the English Abbeys erected during the period selected by you." I should be very much obliged to any subscriber, or any candidate who answered the above question, if they would inform me as to where I may find sufficient information, either from books, or from actual examples in the county of Kent; also if they would be good enough to give me some idea as to the extent and nature of the description and sketches.—CLOISTERS.

[10797]—**Warning Entrance Hall.**—When the entrance and kitchen are on the same floor, is it feasible and advisable to attempt to moderately warm the entrance (10ft. by 16ft.) by means of a coil of hot-water pipes worked from the kitchen boiler? The distance from the boiler would be 40ft. Particulars and any information will much oblige.—HOLDFAST.

[10798]—**Mouldings.**—I shall be glad of any information as to the best methods of obtaining the profile of deep, undercut mouldings from existing buildings!—W. R. G.

[10799]—**Size of Sewers.**—I have felt much interested in the questions and replies relating to the velocity and flow of sewage, but I have never seen a rule for finding the size of either a brick or pipe sewer when the length, inclination, and volume of flow per minute is given. For instance, when the outfall per minute (minimum flow) is 692 gallons, the length one mile, and the fall 8ft., for a brick sewer, the radius of whose invert equals a quarter of the transverse diameter; and also for a pipe sewer, both running, say, two-thirds full? I should be glad to hear of such a rule.—INVERT.

REPLIES.

[10794]—**Hydraulics.**—The factor '01745329, referred to by "X," as occurring in my reply, is the length of the arc subtending an angle of 1°, in parts of the radius, and is thus obtained:—

$$\frac{2\pi}{360} = \frac{2 \times 3.1415926536}{360} = '017453292$$

The 14.7715in. he refers to is, of course, the product of the angle BAC x radius in inches x '01745329 = the length of arc BE required. '01928 is the sine of the angle 70° 31' 44", or 70° 28' 35", as stated.—F. E. GAY, Bath.

[10775]—**Hydraulics.**—I agree with "M. A." that where it is required to find the H.M.D. of a circular pipe, running one-third full, it would simplify the calculation for finding area of wetted segment to adopt a constant 0.22917 (not, as "M. A." states, 0.2234, which appears to be partly a printer's error) obtained as follows:—

$$\frac{1}{4} \left(\frac{\pi \phi}{360} - \frac{\sin \phi}{2} \right) = \frac{1}{4} \left(\frac{3.1416 \times 141'576}{360} - \frac{.6285364}{2} \right) = 0.22917$$

Where ϕ represents the angle BAD of my sketch on page 817 equals 141'576°. This constant to be applied as "M. A." suggests. The method given by "M. A." for obtaining length of wetted perimeter is a useful approximation where the angle is not known; but, of course, in the case now specially under consideration, this, too, would be constant. Consequently the length of the arc can be worked out as quickly and more accurately (though minute accuracy is not always essential in practice) by the formula I have used, $\frac{2\pi R \phi}{360}$.—F. E. GAY, Bath.

[10791].—Inaccessible Distance.—

MON and PMN are set out = 90°
OMN + ONM = 90° (Euclid I. 32)
PMN - OMN = OMP = 90° - OMN = ONM
MOP = MON = 90° (I. 13).

In the triangles PMO and MON we have proved that MOP = MON, and that OMP = ONM. ∴ MPO = OMN (I. 32), and the triangles PMO and MON are equi-angular. ∴ OP : OM :: OM : ON (VI. 4)

$$OP \cdot ON = OM^2. OP = \frac{OM^2}{ON} \text{ (Q.E.D.)}$$

In the articles on surveying this week "L. P. D." will see that the same figure is used in a different way, the advantage of which is that it is not necessary that NOM

and PMN should be right-angles, but only that they should be equal; thus rendering immaterial any error in the instrument used to set them out.—G. W. COBHAM.

Legal.

WHAT IS A "SEWER"?

"A SEWER means something that carries sewage away," so said Lord Coleridge in the Court of Appeal in the recent case of "Meader v. The West Cowes Local Board" (*Times*, June 17), and he further held that the term "sewer," as used in the Public Health Act, 1875, would not include a set of pipes which drained some houses into a cesspool. The legal point taken by the plaintiff here was really very ingenious. It appeared that he had, some eight years ago, built five pairs of houses at West Cowes, having drains at the back leading into a line of 6in. pipes. These ended in a cesspit about 4ft. by 6ft., and then a second line of pipes carried the overflow from the pit over the land of an adjoining owner to discharge it into the river Medina. This owner, however, as he had a right to do, cut off those pipes, thus causing the sewage to flow back into the pit to create a nuisance. The Local Board had frequently called upon the plaintiff to abate the nuisance by cleansing the pit, and the plaintiff then brought this action to restrain the Board from causing the nuisance, contending that the cesspit was part of an existing sewer which had vested in the Local Board itself, and which they were bound to cleanse under the Public Health Act, 1875.

Mr. Justice Chitty held that this was really a bold attempt by the plaintiff to turn the tables on the Board, against whom he had no complaint, but who had a just complaint against him. He dismissed the action with costs. Upon appeal the same result followed, and this ingenious argument failed. Still, there was something in the point that as the pipes did carry the sewage into the river, they formed a sewer of which the cesspit was a portion. There was, however, this difficulty—that taking the pipes over the adjoining owner's land without his leave or license, was really wronging him, and so could not legally rest in the Local Board, while, in fact, they had been cut off by this owner. Then the other pipes leading only to the cesspit could not form a sewer, because they did not actually carry the sewage away, but only took it to the pit and left it there. These pipes, therefore, were regarded by the Court as forming part of the drains, and not as constituting a sewer, so that the plaintiff lost his action with all costs, and will now have to cleanse his cesspit until such time as he and the Local Board can agree upon the construction of a proper sewer.

FRED WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

LEGAL INTELLIGENCE.

A CHURCH RESTORATION DISPUTE AT UPTON BISHOP.—Dr. Tristram, Chancellor of the diocese of Hereford, held a Consistory Court recently, when an application was made for the grant of a confirmatory faculty sanctioning the alterations made in the parish church of Upton Bishop. Mr. France appeared on behalf of the applicants, the vicar, churchwardens, and parishioners, of Upton Bishop; and Mr. Kemp appeared for the opponents, the members of the late Rev. Dr. Havergal's family.—Archdeacon Stanhope stated that he regarded the alterations as a manifest improvement of the church.—Mr. T. Nicholson, diocesan architect, also considered the alterations in the light of improvements, and the Rev. Andrew Pope, vicar of Upton Bishop, supported the application. A lengthy correspondence was read from several of the opponents, protesting against the conversion of what they alleged was a memorial vestry to the late Frances Ridley Havergal into a mere organ-chamber.—Mr. William Smith, builder, Weston-under-Penyard, who carried out the alterations from Mr. Nicholson's plans, stated the vestry in question was not disturbed. The opponents asked the Chancellor not to grant this faculty, and further, to order that the vestry might be restored to its original condition and the organ removed. Mr. Arthur Pearson, architect, was one of the witnesses called for the opponents. Dr. Tristram reserved his judgment.

ALLEGED COLLUSION BETWEEN CLIENT AND ARCHITECT.—In the Queen's Bench Court on Friday the case of "Russell v. Harris" came on before Mr. Justice Denman. Mr. Lumley Smith, Q.C., appeared

for the plaintiff, and Mr. McCall, Q.C., was for the defendant, Harris, and Mr. Waggett for a Mr. Williams, an architect. Mr. Lumley Smith said the plaintiff was an engineer of Oxford-street, and the defendant, Harris, was the proprietor of a club, theatre, and swimming-bath at Bromley, Kent. The action was brought to recover £300 odd and balance due for engineering work done by plaintiff in connection with the swimming-bath. The plaintiff alleged collusion between Harris and Williams, whereby the architect refused to say the work was done to his satisfaction according to contract. The defendant, in reply, alleged the plaintiff had fraudulently done inferior work, and claimed £1,000 for damages sustained through the work not being done according to contract. Mr. Jacob Russell, the plaintiff, said he tendered for the work to be done, and his offer was accepted. Mr. Harris referred him to Williams, but Williams said he was no engineer, and left the matter entirely to the plaintiff, not going near the works during erection. Plaintiff received a plan and particulars from Williams of the well from which the water was to be pumped into the bath; but the well turned out to be quite useless, as previous mistakes had been made in sinking it, the measurements being entirely different to Williams's representations. The witness detailed the various deficiencies of the well, and said he had to put it right before he could erect the pumping machinery. The original contract was for £805, but the extra work was agreed on at £97. £600 had been paid on account, but defendant refused to pay the balance, saying the work had not been done to his architect's satisfaction. Mr. Justice Denman: The question was, who was the architect? Mr. Lumley Smith contended there was no architect at all, as Mr. Williams never acted in the present matter, though he superintended the other buildings. A letter was read from Williams to Harris acknowledging £150 for fees, and telling Harris to refer Russell to him, as Russell was not entitled to a penny more; his opinion was that the whole of the materials supplied by plaintiff were trumpery and second-hand. Witness, continuing, said Williams never gave him an opportunity of a meeting. After hearing further evidence, it was agreed between all parties that the case should be referred to Mr. Ridley, Q.C., as official referee. Mr. Waggett, for the architect, Mr. Williams, demurred to this, as he considered both Mr. Williams's private and professional character were involved. He thought, however, for the other parties' convenience he had better consent to the reference, as his lordship had intimated. The public proceedings in the case then terminated.

A MANX ENGINEERING APPEAL CASE.—Before the Appellate Division of the Manx High Court of Justice, sitting in Douglas on Saturday, Messrs. Holme and King, contractors, Liverpool, appealed against the decision of Deemster Gill. The appellants had sued the Ramsey Town Commissioners for £3,004, an amount due in respect of drainage works, and of this amount Deemster Gill disallowed £2,399, and granted an execution for £1,020. The matter was reheard on the application of Holme and King; but his Honour again decided against the appellants. The counsel for the appellants argued that the decision was against the weight of evidence, that the law upon the points raised was in favour of the claimants, and that the large amount of extra work done, and for which payment was claimed but disallowed, was the result of errors in the plans supplied by the commissioners to the claimants, and upon which the tender was made. The defence was that the claimants were not entitled to recover further than for the amount for which judgment had been given, and that the large amount claimed for extras was not recoverable. The case is not yet concluded.

IN RE W. HANCOX, BIRMINGHAM.—A meeting of the creditors of William Hancox, Upper Thomas-street, Aston, carrying on business as a builder and contractor, was held on Friday. The statement of affairs showed liabilities £495 13s. 1d.; assets, £12 4s. 8d., giving a deficiency of £483 8s. 5d. The report of the Official Receiver stated that the bankrupt commenced business without capital about 1880, in partnership with his father at King's Heath, as a builder. His business was unsuccessful, and in 1882 they went into liquidation. Subsequently bankrupt traded on his own account, and in 1887 he made a private arrangement with his creditors, paying a composition of 5s. in the pound. The present insolvency is attributed to loss on contracts, law costs, want of capital, and interest on borrowed money. At the date of the receiving order the bankrupt was in Winson Green Gaol, having been arrested under a commitment order. The Official Receiver was appointed trustee.

INTERNAL ALTERATIONS AND THE BUILDING ACT.—The coroner's jury who have been investigating the fall of a dancing academy in Holloway, by which two firemen lost their lives, completed their labours on Thursday in last week. Mr. H. H. Collins, district surveyor, said the premises were originally devised as a public-house, but were altered to serve their present purpose. The first floor, of three rooms, was made into one large apartment.

In his opinion, the cause of the accident was the failing of the central shaft, which was far too weak to carry the weight it had to bear. The shaft had been buttressed by the floor joists, and was subjected to considerable vibration caused by the use that the first floor was subjected to, and especially combined with a building that was not well built. He objected to such alterations being made without notice being given to the district surveyor, and thought an alteration in the Metropolitan Building Act should be obtained. He was informed that the whole of the alterations were carried out for £124. Mr. G. H. Carter, builder and sanitary engineer, of Torrington-avenue, Kentish Town, said he carried out the alterations to these premises; but he received no plans or instructions from an architect or surveyor, though he was led to suppose that they were to be to the satisfaction of some surveyor. He thought there ought to have been an architect. He was told the work that was to be done, and carried it out, the brickwork being sound; and he thought the shaft perfectly safe. Mr. C. B. Young, architect, of 17, Coleman-street, who inspected the premises for the builder, agreed with the report of Mr. Collins as to the cause of the accident. The jury, in returning verdicts of death from misadventure, added the following rider: "And the jurors, being persuaded that, in the present case, the collapse of the building was due to defective internal structural alterations, and having heard the evidence of experienced surveyors, desire, in the hope of averting similar calamities, to add most emphatically the expression of their opinion that the extension of the statutory powers of district surveyors is urgently called for, and that such amendments should be made in the Buildings Act as may be necessary to give the County Council and its surveyors control over all internal as well as external alterations of buildings."

WHO CALLS THE TUNE MUST PAY.—BUTLER V. PEMBER.—Mr. Baron Pollock and a special jury heard on Friday an action bearing upon the liability of churchwardens of proprietary chapels for debts incurred for repairs in those buildings. The plaintiff is a builder, and the defendant, who is a house and estate agent, acted as a churchwarden at a proprietary chapel known as Christ's Church, Carlton Hill, St. John's Wood. The plaintiff sued for a sum of £154, the cost of repairs and alterations to the church, which he said had been ordered by the defendant. It was agreed at the trial that only the question of liability should be then tried, and that if necessary the builder's account should be referred. The defence set up was that the orders were given by the defendant as agent for the incumbent, and that, therefore, the defendant was not liable. The late incumbent swore that he gave no orders except to move a font from one place to another, and he was corroborated by the then organist. The defendant said that he never contemplated paying for the repairs, but expected the plaintiff would be paid either out of the funds subscribed or out of a mortgage of the property. The learned judge warned the jury against thinking that because the plaintiff had done the work, and ought to be paid by somebody, the defendant must be liable. The jury ultimately returned a verdict in favour of the plaintiff.

RAILWAY COTTAGES AND THE BUILDING ACT.—At West London Police Court last week, the contractor to the London and South-Western Railway Company was summoned by Mr. Knightley, district surveyor of Hammersmith, for failing to give notice of the erection of certain buildings as required by the Act. Mr. C. T. Giles defended, and claimed exemption on the ground that the buildings were for the purposes of the railway. Mr. Knightley said the defendant had commenced to build on some vacant land in an irregular way in Salgrave-road, near the railway, for the occupation of the company's servants. As the buildings did not form part of the railway the company were not exempted. Mr. Plowden thought the cottages, which would be used by the company's servants, would be as much a part of the railway as a shed or any other building. He dismissed the summons, with £2 2s. costs. Mr. Knightley said that he should appeal to the London County Council.

At Tuesday's meeting of the London County Council, the Asylums Committee was authorised to provide the necessary furniture, bedding, farm stock, &c., required to equip Claybury Asylum before patients could be received, at a cost not exceeding £40,000. They were also authorised to construct farm buildings at this asylum at a cost not exceeding £25,000.

The monument to the late Canon Hannan, of St. Patrick's Catholic Church, Edinburgh, has been unveiled in the Grange Cemetery, Edinburgh. It is of Sicilian marble, about 14ft. high, and takes the form of a Celtic cross. On the back is an inscription in Latin, and on the front another in English. The cross also shows on its face a representation of the features of the Canon, as well as of a chalice and host. The work has been executed by Messrs. Gunn and Co., of Edinburgh.

Our Office Table.

THE list of Parliamentary candidates includes three architects, all of whom are, curiously enough, ranged on the Gladstonian side—Mr. Henry H. Bridgman, C.C. for the Ward of Cheap, who has come forward for Taunton; Mr. T. Chatfield Clarke for Grantham; and Mr. Banister Fletcher for Christchurch, Hants. On the other hand, of the three contractors who are seeking seats, two are Conservatives and the third a Unionist—viz., Mr. John Aird, one of the partners in the eminent firm of Lucas and Aird, who desires re-election for North Paddington, and Mr. J. T. Firbank, the railway contractor, who is put forward for Haggerston; while Sir William Arroll, the contractor for the Forth Bridge, is put forward for North Ayrshire. Mr. D. Ford Goddard, who succeeded his father, the late Mr. Ebenezer Goddard, as manager of the gasworks at Ipswich, an appointment he resigned after a few years, is the Gladstonian candidate for that borough, of which he has just resigned the Mayoralty; Dr. B. W. Richardson is standing in the Gladstonian interest for Walton, Liverpool; and Mr. John Burns is put forward in the Labour interest for Battersea.

THE latest proposal for a new street from Holborn to the Strand propounded by the Improvements Committee of the London County Council is of a more comprehensive nature than any previous ones. A straight line, 100ft. wide, is proposed to be drawn from the junction of Little Queen-street and Holborn to St. Mary's Church in the Strand, terminating behind the church with a raised terrace, from which gentle slopes will carry the traffic east and west into the Strand. The Holywell-street island is bound, of course, to be demolished. A circus is to be formed in the middle of the new thoroughfare—which it is suggested might be named the "Council Broadway"—on the line of Sardinia-street, leading into Lincoln's Inn-fields. The cost of the scheme is estimated at over two millions, and if approved by the County Council, who have postponed its consideration for three weeks, it will form a feature of next session's Parliamentary Bills.

GRAY'S INN is at last to have a new chapel. The discussion about the rooks has apparently done some good. The hideous iron erections in the gardens, which drove away the rooks from their nests and their young, were put up for classrooms, which, under the new lecture system of the four Inns of Court, were rendered necessary. Gray's Inn had no rooms to offer except its chapel, which is a four-walled flat-roofed room in which music is well-nigh impossible and ornamentation out of place. So, after a long and protracted discussion, the majority of the Benchers have secured a resolution for the building of an Elizabethan or Late Tudor chapel in the gardens. The old chapel will take the place of the offending iron structures, and become a place of legal rather than religious work. We have commented elsewhere on the extraordinary manner in which the competition for the new structure is being conducted. The question, according to the *Manchester Guardian*, was started by a Nonconforming member of the Bench (who objected to the proposal) whether the chapel had ever been consecrated. There are no records of this on the Society's books, for, of course, like the other inns, it has never recognised the Bishop of the Diocese as Ordinary, and if the Temple was consecrated it was in the days of the Knights Templars, as the Master of the Temple claims not only to be his own Ordinary, but also to walk before the Archbishop of Canterbury in the Temple itself.

THE hydraulic power in London is largely utilised. We understand that at the principal pumping-station of the Hydraulic Power Company at Holland-street, Blackfriars, there are four sets of compound pumping-engines, each of which is capable of delivering 300 gallons of water per minute into the accumulators at 750lb. pressure per square inch. The system has been doubled in four years, and there are now, it is stated by Mr. E. B. Ellington, M.I.C.E., 55 miles of street mains laid, and power supplied to 1,700 machines, lifts, &c., which required about 100,000 gallons of water to be pumped per hour. A pressure of over 700lb. per square inch is maintained.

CARDIFF is rapidly growing, and consequently

needs entirely new public buildings, and finds its existing edifices inadequate and inconveniently planned. Sites are required on which to house a new town-hall and municipal buildings, university college, technical instruction schools, Welsh intermediate schools, public baths, and a museum. The corporation have been nibbling for years at a piece of land in Quay-street which some thought would do for municipal offices, but have now abandoned it, as the price asked was too high. A scheme is on foot for purchasing Cathays Park from the Marquis of Bute (if his lordship should prove both able and willing to sell it for the purpose), and to build the whole of the much-required public institutions in the centre of the park, leaving a grass-covered open space all round. Such a bold scheme for concentrating the civic edifices would, if carried out in a liberal and far-seeing spirit, arouse a healthy public feeling in Cardiff, while the group of buildings could hardly fail to add to its dignity and appearance. The proposal would probably be less costly than a system of purchasing little plots in obscure by-streets on which to build indispensable offices, and of tinkering up old buildings to suit the hand-to-mouth requirements of the hour.

THERE is to be an International Exhibition of Building Materials at Lemberg this year, under the auspices of the Governor of Galicia. The exhibition, which will be opened on the 30th August and closed on the 20th September, 1892, will include: Stone, bricks, marble, cement, lime, timber, and iron; locksmiths' work, forged goods, metals employed in architecture, roofs, carpenters' work, glass, asphalt, waterproofs, paints, lacquers, varnish, paper-hangings, tapestry, water supply and pumping apparatus, bathing contrivances, ventilators, lighting materials, sewers, lifts, arrangements for extinguishing fire, domestic telegraphs, telephones, special arrangements chiefly of a hygienic nature, oil-cloth, carpets, &c. The executive committee meets at Lemberg. A special jury will allot State medals to the exhibitors on behalf of the Austro-Hungarian Government. Parties interested and requiring information are requested to apply without delay to Mr. Arthur Gobiet, at Karolinenthal, Prague.

Trade News.

WAGES MOVEMENTS.

THE LONDON BUILDING TRADE.—The new working rules for the whole of the building trades agreed to at the conference of masters and men, on the 10th ult., were signed on Thursday afternoon, the 23rd ult., at the offices of the Central Master Builders' Association, Bedford-street, Strand, when all parties concerned were present.

THE BIRMINGHAM BUILDING STRIKE.—SETTLEMENT OF THE DISPUTE.—The dispute in the building trade of Birmingham has at length been settled, thanks to the intervention of the stipendiary (Mr. T. M. Colmore). The bricklayers asked for the immediate increase of a halfpenny per hour, raising their wages to 9d. per hour; that the clause in the rules referring to arbitration should be waived; and that the new rule with respect to the increased wages should be signed and agreed to by both sides until, at any rate, April 1, 1894. The employers eventually conceded all the terms with the exception of the last, and were willing that the rules should be signed until April 1 next year. The stipendiary advised the men's representatives to accept the compromise, and at a general meeting of the men on strike held on Tuesday at the offices of the Bricklayers' Society in Navigation-street, Mr. J. Camm, the president of the society, presiding, it was decided to do so, and work was accordingly resumed yesterday (Thursday) morning. The strike has lasted exactly thirteen weeks, having commenced on April 1.

BOLTON.—The Bolton Master Builders' Association has resolved upon a general lock-out if the plumbers do not accept their terms or consent to arbitration. The men have been on strike eight weeks, owing to a dispute with regard to the apprenticeship rules and the allowance for lodging. On the latter point the men ask 3s., and the masters offer 2s. 6d.

BRISTOL.—During the past week the president and ex-president of the Bristol Chamber of Commerce (Messrs. J. R. Bennett and J. Dove Wilcox) have sat as arbitrators to settle differences between the builders and their labourers and plasterers, but the awards have not been announced. The bricklayers and stonemasons have sent in notices asking for an increase of wages and an alteration of rules.

Up to the present time the offer to refer this matter also to arbitration has been declined.

REDDITCH.—The strike among the bricklayers of Redditch and district has ended, the masters having conceded the demand of the men for an increase from 7d. to 7½d. in the rate of pay per hour. An arrangement has been arrived at respecting the rules submitted by both parties in the dispute. The strike had lasted three weeks.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (July 9).—Architectural Association. Third Summer visit to Colonel North's house at Eltham, and to the remains of Eltham Palace. Train leaves Cannon-street Station at 1.45 p.m. Trains return from Eltham at 6.29, 7.25, 7.52. P.O. for 1s. 6d. (this includes fare) must be sent to Edmund Woodthorpe, 1, Circus-place, E.C., on or before Wednesday, the 8th instant. Meet at Cannon-street Station about 1.30.

The Architectural Association.—July 9. Third Summer Visit to Colonel North's house at Eltham, and to Eltham Palace. 1.45 p.m. train from Cannon-street. P.O. 1s. 6d. to be sent to E. Woodthorpe, Esq., 1, Circus-place, E.C., before Wednesday, the 8th inst. ERNEST S. GALE F. T. W. GOLDSMITH } Hon. Secs.

Holloway's Ointment and Pills.—Reliable Remedies.—In wounds, bruises, sprains, granular swellings, enlarged veins, neuralgic pains and rheumatism, the application of this soothing Ointment to the affected parts not only gives the greatest ease, but likewise cures the complaint. The Pills much assist in banishing the tendency to rheumatism and similar painful disorders.

IMPORTANT TO BUILDERS. RANDALL'S SOLUTION FOR MORTAR, rendering it equal to cement. Hardens stone. N.B.—Depot removed to West End-green, West Hampstead, N.W.; and at Eastlea, Poole.

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.

SOLE AGENTS for England, J. & A. CREW, Cumberland Market, London, N.W.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone on these Quarries is known as "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shenton Mill, Somerset. London Agent:—Mr. E. A. WILLIAMS, 15, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—THE HAM HILL STONE COMPANY, NORTON, STONE-UNDER-HAM, SOMERSET.

Mr. E. A. WILLIAMS, 15, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 28, Fitch-street, Soho, London, W. Established 60 years.

WM. OLIVER & SONS, MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ARDLEIGH.—For the erection of stables and coach-house, for Messrs. T. Moy, Limited, Colchester. Mr. J. W. Start, F.S.I., Cup's Chambers, Colchester, architect:—

Chambers, W. A., Colchester	£379 0 0
Beaumont, R., Loxden	370 0 0
Fenn, W., Ardleigh (accepted)	247 0 0

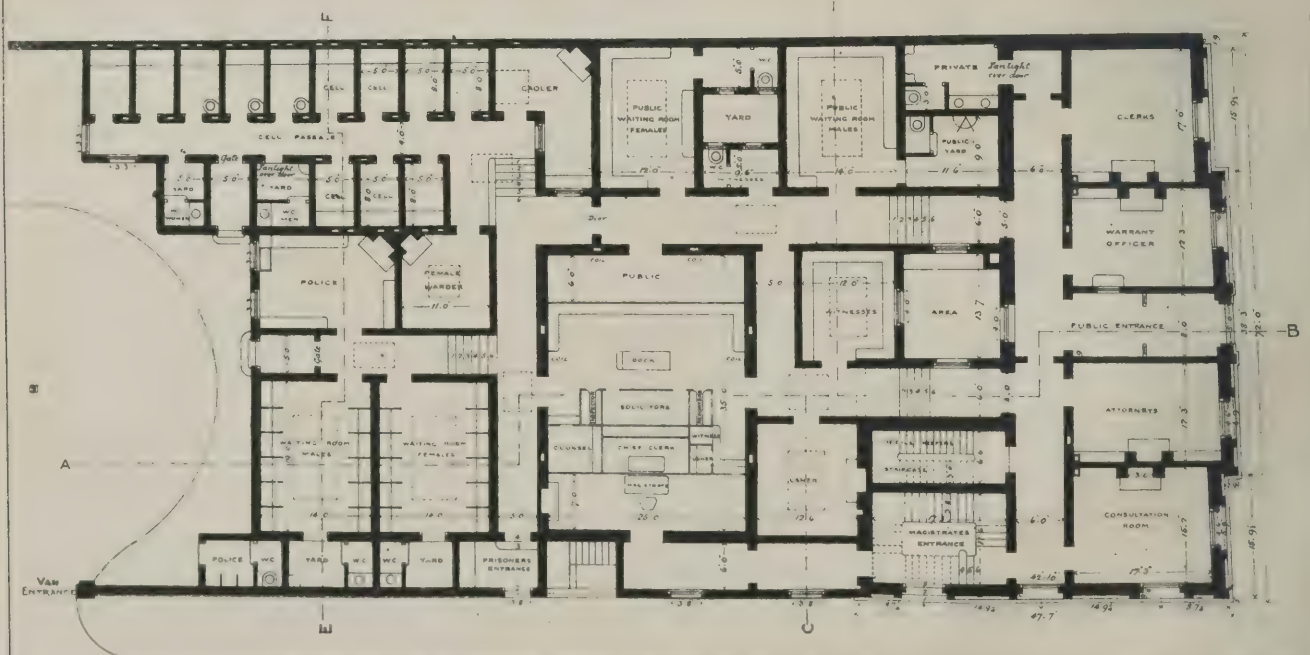

AUDENSHAW.—For sewerage, levelling, paving, kerbing, flagging, and completing Booth-road, Audenshaw, for the Audenshaw local board. Mr. J. H. Burton, Ashton-under-Lyne, surveyor:—

Worthington and Pownall, Manchester (per schedule of prices).

(Four tenders were received.)

FRIDAY, JULY 8, 1892.

DESIDERATA IN COMPETITIONS.

THE influence of locality and site in determining the design of a public building has been regarded with indifference by promoters and competitors alike, often owing to the little discretion that committees have in the selection of a locality. Very often it is a mere question of opportunity. Municipal authorities have not every day the chance thrown in their way of laying down a plan of a town and of deciding where their town-halls, magistrates' courts, public offices, markets, libraries and museums, and other institutions are to be placed. In many towns the corporations have no other choice than to accept or reject some vacant site or ground that may possess the advantage of abutting on a main street or be a corner plot. The ground may be irregular and have objectionable boundaries on the remaining sides, or the levels of the land may be awkward. These irregularities are unfortunately disregarded. Committees and clients imagine architects can cut their buildings to anything, no matter how crooked, and erect a handsome structure on any sort of site. Then there is neglect on both sides. Competing architects very seldom make a personal inspection of the site, and the promoters of the competition do not make it necessary that they should see it. In many recent competition instructions, the peculiarity of site has been overlooked, and those who compete have been allowed to draw their own conclusions and to make their plans, irrespective of any local considerations. Even the recent Institute "Suggestions" appear to have avoided any reference to the point. We may urge, indeed, that in all competitions for edifices on sites that are irregular special conditions should be laid down. It is only fair that each competitor should know the locality, the boundaries and their varying heights, the style of the surrounding buildings; and these matters are as important as the levels. Let us suppose that A. resides in the locality of the site, and obtains every information respecting the boundaries, the approaches, and any proposed alteration that is about to be made to them. He knows which side the main fronts of the building should be, and as he can examine the heights of surrounding buildings abutting on the site, he can prepare a design with much more certainty of a success than B., who does not know the town, or has not thought it expedient to pay a visit; or even than C., who has obtained his information second-hand, and who has been supplied with a few data about levels, &c., through the surveyor to the authority, whose printed plans and sections may not be free from error, or may be construed wrongly. A. has therefore considerable advantage over B. or C. In the preparation of his elevations and perspective he has taken into account the proximity of a building of considerable height and the ancient lights of adjoining premises, and has thereby been able to conceal or balance the one and to avoid the ill consequences of being compelled to alter the elevation or modify its height to suit the other. A. has made his main façade towards a street that will give the best perspective and be seen without obstruction, while B. and C. have fallen into the fatal error of arranging their main elevations in such a manner as will very badly unite with buildings on either side, and of placing the windows of principal rooms opposite inferior premises. Imagine, if one can, a finely-pro-

portioned tower placed alongside or near to a factory chimney, or a low wing overshadowed by a prodigious erection on one side. It would be untrue to say that A., B., and C. had a fair and equal chance in the contest. In the Sheffield and Oxford competitions this want of equality is manifest in the designs. The Oxford building site is irregular in its outline, and there is an obtuse angle at the junction of the two principal frontages in St. Aldate's-street and Blue Boar-street. Two of the competitors in the final competition have arranged their building with a square angle, which, of course, sacrificed a portion of the area. As a matter of architectural propriety, this plan is desirable; but the author of the winning design arranged the return front to follow the line of side street, and thereby scored a point which was no doubt approved by the committee as being most economical.

Now it would be saving some trouble and questioning in the minds of competitors if promoters, before they published their instructions and plan, decided this question of irregular angle, or at least suggested to the competitors the course they thought desirable, for in some instances it may be necessary to follow the boundary. Competitors would also be glad to be relieved of any responsibility on such a point, as their own preference may sometimes suggest to them a course which could not be favourable to their chances of success, and, in fact, may absolutely jeopardise the acceptance of their design. In the recent Bath municipal building competition the question of "right" or "acute" angle was raised, and no doubt entered into the consideration of the assessor in awarding the prize. Not only do the questions of boundary and angle enter deeply into the mind of architects engaged in preparing designs for large public buildings, but they exercise a material influence in the actual results. Crookedness and irregularity have spoiled many buildings executed, particularly when after some years the old premises surrounding them have been removed. What can be done to rectify the bareness and broken outline exposed to view? The want of rectangularity destroys the perspective of the main fronts, the deviation of the axes of the principal blocks, cut awkwardly in the lines of roofs; every feature looks disturbed, as if some twist of the site had caused the buildings to appear awry. Internally, the rooms and corridors and halls are crooked, or bent to suit the angles, much to the lack of equanimity of mind and eye. There is an erratic and capricious appearance sadly destructive to all decorative effect. Surely these things are as much a matter for decision beforehand as the conditions of cost and accommodation? Equally important becomes the question of character of the surrounding buildings, which is also left to the designer. A completely prepared set of instructions ought to describe the local character of the buildings or landscape. The style of the adjoining edifices, if there are any of particular mark, and the surrounding streets and approaches, ought to be described and shown on plan. A hilly background from the higher levels of which the proposed building may be seen, or a declivity of the ground in front, are vital conditions. If, for instance, from a street in the immediate vicinity the eye will be able to obtain a partially bird's-eye view of the edifice, how supremely ridiculous would be buildings planned on irregular axes, or flat roofs with high parapets towards the main streets. In such a case considerable care is necessary in grouping the blocks and in designing the roofs and inner quadrangles. Then we are accustomed to see domical features and towers placed in such a position that they cannot be seen from a declivitous approach to the building, not having been designed

high enough. The levels not only of the immediate streets and approaches ought to be furnished, but the point of view both in respect of position on plan and height of the eye in relation to the main fronts. For instance, the practicable level of the eye or "horizontal line" may be not higher than the ground level of the building or some feet below it, so that all tall features within the area ought to be heightened. On the other hand, it may be so high up, if the building site lies in a valley or a depression of the ground, that greater altitude in the elevations, or more regard to the upper features may be required to render the edifice of sufficient importance. These are matters usually left to the unwary competitor. If he takes the trouble to inform himself by a personal visit to the locality, all may be well; but if he depends on the written instructions as they are given him, he may find that he is very far from having interpreted the instructions aright, while laying a flattering unction to his soul as to the merits of his labours. The points we have considered are as much conditions of a properly conducted competition as any of those other requirements which are thought to be absolutely essential.

THE ROYAL SOCIETY OF BRITISH ARTISTS.

THE special exhibition of oil and water-colour paintings now to be seen in the Suffolk-street Galleries is intended to commemorate the seventieth anniversary of the foundation of the society. Many of the members have voluntarily contributed pictures, and the addition of other works render the collection both interesting and representative. In the large gallery are to be seen several more or less important canvases by Sir John Gilbert, R.A., Dudley Hardy, E. Burne-Jones, A.R.A., P. H. Calderon, R.A., Anderson Hague, T. B. Hardy, and others. "The Return of the Victors," by Sir John Gilbert, R.A. (29), is a large and characteristic composition by this master of historic and legendary subjects. The procession of armour-clad knights on their steeds, with their banners and trophies of victory, and the ladies walking abreast with flowers and wreaths, trumpeters leading the way, make a gorgeous composition in which the invention and picturesque qualities of this painter of warriors and historic incident are seen in their best. Sir John's power as a depicter of the pomp and circumstance of war, is here undoubted, and he can better than most men paint masses and groups of warriors and horsemen, and impart poetry and action to the figures. In the corner of room (63), the soldier on his charger, banner in hand, urging onward his followers, is bold and full of action; while "Fair St. George" (69) is a legend which, in the hands of this veteran master, has been painted with a sense of picturesqueness and colour never surpassed. The painter probably here depicts the incident as recorded in a well-known ballad in Percy's "Reliques." The dragon has been killed, and "Fair St. George" holds the monster round the neck by a ribbon. Both the Red Cross Knight and the fair maiden are represented. At the corner of large room, one of the painter's well-known Shakesperian incidents is exhibited, "Ege et Rex Meus" (76), Henry VIII. leaning on Cardinal Wolsey's shoulder—a scene in the 1st Act of "Henry VIII." The Cardinal, with scarlet robes and cassock, is a notable and well-painted figure in this picture. Next we pass to F. H. A. Parker's picture of "Cupid and Psyche" (34), a darkened chamber with a reposing Cupid, over whom Psyche stands holding a lamp, graceful in composition and clever in treatment of light. H. T. Schäfer's "The Old Capstan" (36) is feelingly painted. E.

Burne-Jones, A.R.A., whose works adorn these walls, contributes one of his finest conceptions. "The Painter's Daughter," a very sweet and beneficent face, behind whose head is a circular mirror which reflects, while it gives a halo-like effect. The figure, clad in a deep blue close-fitting dress, the hands together on her lap, is in keeping with the spiritualised conception of the wistful-eyed face. The imagination and colour are both poetical and refined. Vigorous is W. H. Pike's "Jacobite Toast." G. S. Walter's "Sunrise on the Medway" (45); J. A. Lomax's small cabinet, "The Pith of the Argument," an 18th-century dining-room scene; P. H. Calderon's "Hagar," a picture well known to visitors at a recent Academy exhibition, and W. H. Y. Titcomb's clever interior scene, "Primitive Methodists" (57), in a chapel during prayer, are among the principal pictures. A very colossal picture of grey tone occupies the place of honour of this gallery. It is by Dudley Hardy, and represents "Trafalgar Square in 1887," when it became a refuge for foreigners of all nationalities. The painter shows the Square at night-time, or early morning, the grey damp mists hanging over the scene, above which loom the cupolas of the National Gallery. In all conceivable attitudes, men and women are huddled together for warmth and shelter, some asleep, others reclining with bandaged limbs, seeking relief round the base of one of the pedestals of Nelson's column. The scene is one of misery and desolation. The wet pavement reflecting the dim light, the careworn and emaciated faces and forms of men and women, present, with pitiless realism, the sufferings of the homeless on that hapless occasion. Mr. Dudley Hardy, in his great picture "Sans Asile," has powerfully painted, though not exaggerated, the sufferings of that mass of shelterless humanity, and his picture received well-merited encomiums from our French neighbours when it hung in the Salon. The composition is happily balanced by the single figure of a young woman leaning against the corner of the pedestal. Anderson Hague's rich autumnal landscape (72); A. Glendenning's "Edge of the Heath" (79), in a low key of colour; T. B. Hardy's large water-colour (87); and Edgar Bundy's "The Best of Good Cheer," a study of a friar (93), are other pictures of interest.

The north-west gallery contains two other of the last painter's clever pictures, "Studious Companions," a friar and his cat, admirable in its treatment and colour (1), and an interior in which the figures of lady and cavalier are painted with knowledge of 16th-century details. The portraits by G. F. Watts, R.A., of the Marquis of Salisbury and the late Robert Browning, the last a side face, are painted with much characterisation; also a good portrait of William Morris (5). That of Mr. Wyke Bayliss is, to our mind, a less satisfactory portrait, though the light and colouring are well managed. An idealistic study by E. Burne-Jones, "The Moon," is a decorative treatment in blue of much grace of line and beauty. A masterly picture is by Arnold Priestman, a moorland hillside, the brown hill and clouds forcibly painted. Sir F. Leighton, P.R.A., sends five very beautiful studies of pictures painted for the Academy. The "Garden of Hesperides," "Phryne at the Bath," "At the Fountain," "Perseus and Andromeda," and "Bacchante," are here, and as colour and composition sketches they are valuable contributions. J. L. Pickering has two works, "The Edge of the Common" and "February," the latter a large, luminous, and broadly-painted homestead and meadows (21); and we also notice W. Harding Smith's clever "Tomb of Rahere in St. Bartholomew's Church"; a fine landscape, a hillside with sheep under evening light, by A. Hartley;

"Evening" (19), and a strongly-painted "Hillside" (22), by J. Olsson. J. S. Noble has a few fine animal pictures. "The Village Smithy" is a splendid study of a cart-horse, mule, and dog awaiting the operation of shoeing; and "Old Veterans" (140), a group of hounds, is full of character. "Nature's Floral Carpet," by W. S. Jay (101), is a forest scene with leafless trees and primroses; next to it J. Olsson has a luminous seascape, the waves breaking on a sandy beach; O. Rickatson "A Hampshire Mill" (106) is rich in colour. A strong and vigorous landscape is sent by Anderson Hague, and an exceedingly beautiful woodland by A. Kinsley (110) delicate in its colour and blendings of foliage. Horace H. Cauty's "Scandal" (108) is brilliant and clever. In the S.W. gallery, H. T. Schäfer has a solidly-painted darkened interior, dimly lighted by a lamp, where an old money-lender has on a table bags of gold, and, with half-frightened look, staggers as he hears a sound—a hand is seen between the folds of a dark curtain. The subject is powerfully painted. Dudley Hardy's "A La Foire" (128), A. Ludovici's "Dolly"; J. Herbert Snell's "In Chancery," a fine grey view of a park with its dismantled and desolated garden (138); W. H. Y. Titcomb's "Gull Nesting" (141), and a freshly-coloured harbour view of "Staithes, Yorkshire," by V. P. Yglesias (139), are among the pictures of merit.

In the N.W. gallery the president, Wyke Bayliss, has a grand interior view of Amiens Cathedral looking across the transept, painted with all the subtle charms of perspective and colour, and light and shade which such an interior can give. The procession of scarlet-robed priests, and acolytes with banners and incense make an impressive picture. His other interior view of Orvieto Cathedral (177) is most delicate in its colour, and the Romanesque arcades, with their bands of coloured marble and details, are drawn with admirable feeling. St. Madeleine, Troyes, is another fine drawing (196). Other water colours include a view of a hamlet by W. Follen Bishop (146) of much beauty and delicacy of drawing and colour, two finely painted landscapes by Bernard Evans (159 and 164) in the South of France, some studies of heads and draperies in chalk and pencil by E. Burne-Jones; an idealised figure study, "Summer Rain," by H. T. Schäfer (186), and charming colour drawings by W. Harding Smith, one the shrine of St. Alban in St. Alban's Abbey (199); and other works by the late W. Collingwood Smith, J. Fullwood (208), and Leopold Rivers (213) are among the collection.

STABILITY OF WALLS ON SOILS.—I.

THE engineer's watchword of stability is to "keep the resultant of pressures within the middle third"; but the architect's is to "keep it precisely central" (he admits of no such deviation). The engineer and the architect, however, have each different systems of utilities imposed upon them. Thus the engineer provides for stability of his structures under moving massive loads, which deviate the position of the resultants of pressures. The architect, while having also to provide for a needful degree of stability, must likewise provide for the various requirements of domestic or civil occupation, as well as stately and agreeable appearance according to conventional or other canons of artistic taste and architectural treatment.

Now, preceding all tangible evidences of design in the order of development of a structure from its conception—that is, preceding the realisation by either the engineer or the architect of the great objects of the exercise of his profession—there must not only be the creation of a mental design of the structure in all its parts, but also of all the details of the possibilities of its practical execution; for neither can build his structures wholly in mid-air, though some may rear up high into it, yet they must be founded upon rock, either in its solid or its

disintegrated form. Our present inquiry will, therefore, begin with the primary requirements of all buildings—the stability of their foundations. This will be viewed with special reference to some neglected conditions in foundation practice and wall stability, with appropriate consideration of the isolation of static pier foundations in compressible soils, as affecting fenestrated walls.

Mutual Alliance of Engineer and Architect.—The extensive range of requirements of modern commercial and other buildings, involving many intricate engineering problems in varying forms in each building, has induced the association of the engineer with the architect in devising improved details of the structural design, resulting in enhancing the economy of stability and in effecting facility of safe construction by a more scientific treatment of the problems involved. In Chicago, New York, Boston, and other American cities the architects in most extensive practice have constituted an engineering department in their office establishments, presided over by a competent engineer, with a trained staff; other prominent architects have in alliance their appointed consulting engineers, who attend to the engineering requirements of their practice.

Reciprocity of Good Offices.—But while the architect has thus deferred his structural problems to the engineer, the engineer has not reciprocated to an equal extent in affording architects the opportunity of artistically treating their structures, and hence many of the railway terminal buildings in our cities show a decided lack of architectural treatment, which is much to be regretted. Perhaps we are not to attribute this unfortunate state of things solely to the reluctance of the engineer to have in requisition the services of the architect; but whatever be the influencing causes, they ought not to be allowed to operate any longer to the detriment of the display of architecture in this respect in our cities. For, say and think what we may, an ungainly building sheds some baneful influence upon its beholders in one form or other; and, on the other hand, a building that skillfully embodies a refinement of artistic treatment is "a thing of beauty and a joy for ever" to every beholder. Some of the class of buildings alluded to occupy prominent sites.

Static Action of Walls upon Soils.—The stability of walls depends not only upon the stability of the foundation soils upon which they are built, but also upon the conditions which regulate the action of walls upon compressible soils being such as tend to promote static equilibrium of the forces and reactions concerned. The conditions which are involved in the static action and reaction of these forces will here be considered.

Continuous-width Foundations under Voids and Solids alike are Unscientific.—The evidences of a prevalence of this practice in the wrong distribution of the wall-bases of foundations, giving equal bearings upon the soil to voids and solids in fenestrated walls, are to be seen on all hands, not only in the Metropolitan area and suburbs, but likewise throughout the provinces.

The Faults thereby Induced.—The evil and unsightly consequences of this wrong practice when dealing with compressible soils in producing unequal fenestrated wall settlements with lateral, vertical, and transverse deformations are no doubt familiar to all, but perhaps not sufficiently appreciated as regards their consequences to the domestic health and comfort of the household. Much of these consequences cannot be estimated in L. s. d., but what is of immediate concern to the inmates is often of a more vital value. The constant worry, annoyance, and inconvenience, as well as the practical discomforts of intolerable draughts afflicting a household, caused by ill-fitting, deformed doors, windows, shutters, locks, and fastenings have sometimes far-reaching effects. Windows, doors, and shutters which, when "closed," are separated from their frames at top and bottom by perhaps $\frac{1}{4}$ in. or larger void at one side, caused by unequal settlements producing distortion of the frame, forming apertures which cannot be closed, are frequently to be seen, especially in old houses; likewise floors uneven and sadly out of level, and separated from the walls, skirtings, &c. The walls and partitions are twisted, cracked, and fissured, the ceilings with cracked and falling plaster. The architraves and other finish, the strings, belt-courses, sills, plinths, cornices, and stone dressings, all are cracked, bowed or bulged, and violently out of level at different points, and otherwise distorted, hori-

zonally as well as vertically. The transoms between horizontal tiers of voids or spandrels, arches, &c., and the piers are more or less fissured or shattered, and the whole building more or less "pulled to pieces." Where houses have been pulled down it will be observed that those which remain standing have, in many instances, their front or back walls, or both, separated almost their whole height from the cross-walls by a continuous fissure of a $\frac{1}{2}$ in. to 1 in. in width. This indicates that there have

exemplified by the resistance of pinnacle loads to the horizontal thrust of flying buttresses, vaultings, &c.

In calling attention to the examples of consequences of faulty footing design, our object is to avoid giving invidious prominence to their designers, and only to point out the positions and modes of occurrence of the internal disfigurements; hence reference to recent buildings in which these faults are prominent is omitted.

The first figure (Fig. 1) shows very clearly a grave fault, and the mode of its occurrence is not less evident. It arises from the difference of reactions of the underlying soil due to the difference of loading the footings underneath the voids, and solid piers, which likewise support the arch with the spandrel, &c., above it. Then drawing perpendiculars, arrow r , on the centre of the plane of reaction of the soil on the footings, and likewise P from the common or resultant centre of gravity g of the loads of walling, &c., on either side of the void, the perpendicular distance apart of the points P or of these intersections gives the leverage of the moment of the static couple which accomplishes the disturbance. The result is shown in the convex curvature of the horizontal lines of the window sill, plinth, &c., and also in the fissures occurring in the spandrels above and below the window. In tall, narrow buildings in which the centre of gravity is high up, a very slight depression of the outside end of the footing produces a corresponding exaggerated movement outward of the centre of gravity of the wall as indicated by the outward radial dotted line. The old Lincoln's Inn gateway, Chancery-lane, is a prominent example of this unequal loading upon the continuous footing base. St. Stephen's Church, Coleman-street, E.C., is another prominent example of this fault. The arrows indicate the direction of the action of the static forces in all the figures.

This static couple action is also an exemplification of the similar static action which occurs in fenestrated walls in which all the solid wall above the lowest void forming the "bay" receives abutting support from the continuous vertical solid wall, a static pier between the vertical tiers of voids. The footing underneath the tier of voids only supports a portion of the wall underneath the lowest void, corresponding to the tympanum of the natural masonry arch. (See discussion under "Natural Masonry Arch" further on.)

Bay Windows.—The next two, Figs. 2 and 3, show faults arising from different causes, or, rather, modes of occurrence. Fig. 2.—The bay window in the recent building from which this example is taken is six stories high, and faced with stone. Two iron column mullions are introduced to intercept light as little as possible in the basement story. These support the upper stories. They are placed so that the mullioned window-frame is set inside them, and are thus necessarily placed eccentrically upon the outer third of the usual form of footing base of the low foundation wall underneath, and thus a static couple is created transversely of the wall on the plane of the soil upon the footing base, producing by unequal settlement a tilting out of the foundations, resulting in rupture of the spandrels between voids, displaying the cracks indicated.

The Oriel (Fig. 3), on the other hand, shows the effect of a lower story pier acting as a mullion only, and thereby also creating a static couple longitudinally of the wall. Observe that the abutments support the portion of the upper two stories which are placed over the lower pier mullions, so that thus the abutments support six stories besides the ceiling to the top story, also the main cornice and roof which surmount the position of the oriel, while the pier mullions only support three stories, including the oriel structure. The upward thrust of the lightly loaded piers produced by the reaction of the soil is indicated by arrows. The result is a crack in the stone lintel over the left window.

A Venetian Window, over a pair of windows (Fig. 4) in the lower of five stories, has a similar effect to the oriel, but in an intensified form, for in the building alluded to, the abutment supports five plus three and a half stories (counting the floor of the ground story as half a story), while the mullion-pier only supports the basement story and the floor of the ground story. The oblique fissures branching upwards from the pier indicate the upward thrust (denoted by arrows) produced by the surplus reaction of the lightly loaded soil. The window sill is bowed or

cracked, and the whole front of the house deformed.

Note.—Some have attempted to remedy the upward thrust (in Figs. 3 and 4), and similar cases, involving the same static principle, by introducing an inverted arch between the abutments; but this only caused worse consequences, resulting like Fig. 1. A proper arch would have had the desired effect if the footings underneath the void had been omitted.

(To be continued.)

FILTERING WATER.—III.

AMONGST other materials tried to effectively remove impurities from water, as animal carbon does, were pounded coke, which is another form of carbon, also finely-powdered shells; but neither had the desired effect. Either of these materials can be used in place of sand, and there is just the possibility that coke dust would act just as effectively as a strainer, and even remove smaller particles than sand would. Sand, however, is so easily and cheaply obtained, and coke dust is so little (if any) better, that this latter material is rarely used.

The attempts that have been made to improve upon animal carbon have been with the object of discovering something that will not only remove all impurities (and particularly those that sand will not deal with); but will also further deal with them and bring about their destruction, or at least render them inert and harmless. This is, of course, a result so excellent that it raises a doubt whether it can possibly be attained. With animal carbon the result is to simply store up the objectionable matter, and, as some say, to really promote worse features in this collection. With the attempts that have been made, substances are being used that are, we might say, antagonistic to organic impurities, and the two cannot exist together. It is generally acknowledged that if a free supply of air or free oxygen could be introduced to the impure matter collected in a filter, a considerable change in its condition would be effected. The union of oxygen with the matter goes to convert it into a harmless gas, or in other words the foul material is used up, a species of combustion taking place (but without any of the customary noticeable results that we get from a fire).

The first material of this kind worthy of notice is "Manganous Carbon." This material has been taken up by Messrs. Doulton and Co., and is used by them in the various forms of filters they make. It is a substance that bears an excellent reputation in many ways. As the name implies, this material consists of animal carbon and manganese; but the two are so treated and combined as to nearly represent a new compound. The carbon is recarbonised with manganese dioxide, so that the latter becomes thoroughly incorporated with the former; otherwise the results would not be so satisfactory. Manganese dioxide, or black manganese, as it is sometimes called, is exceedingly rich in oxygen, and furthermore, should it be robbed of this gas and reduced to a lower oxide, it readily re-absorbs any that is afterwards brought within its influence. The action that takes place is therefore the oxidising or consuming of impurities, using some proportion of its oxygen in so doing, and then replenishing itself at the first available moment from air or any oxygen-bearing substance that comes near it. The makers of these filters claim that, unlike ordinary animal carbon which acts with its maximum power at first and gradually decreases in efficiency, manganous carbon really increases in power for some time, then continues for a considerable period in a normal state. An experimental filter given daily use with ordinary water was found after two years to be fit for further service without special treatment. It is, however, to be supposed that by ordinary water is meant a London Water Company's water, which should not yield abundantly of contaminating matter. This material can be had in two or three forms of cistern filters.

The Spongy Iron Filter Company, as the name implies, utilise iron which has by process been brought to a porous state, something like sponge, but without the elasticity of this latter material. With this substance, as with manganous carbon, it is the oxygen-bearing properties of the iron that is relied upon; the using up of the impurities reducing the oxide (peroxide), but which revives itself from oxygen that comes

been violent opposing forces in operation to produce such a complete dislocation of the walls.

Many of the cases of ruptured segmental arches over doorways, which abut upon slender engaged abutments—or, rather, upon cross-wall ends—are not due to the abutting thrust of the arch so much as to the horizontal component thrust excited by the radial action of the static couple created by the superfluous foundation underneath the doorway void, which tends to tilt the pier outwardly, and thus spread the arch.

This radial action of the static couple likewise neutralises the resistance induced by the superstructural load upon the abutments, the resistance of which to horizontal thrust is simply

within its influence from other sources. By this means the purifying action of the filtering material is lengthened very considerably. Theoretically, we might consider that it would go on for ever, but this is not strictly correct. There are impurities that even this material cannot deal with so far as to destroy, but which go to choke up the filter in time. The grit or earthy matter that renders some waters turbid if passed direct to the filter would go to choke its pores. This, of course, is only pointed out to show that all filters require to be subjected to some sort of cleaning process from time to time. The cleaning of cistern filters of these kinds is, however, less trouble than with those using plain carbon, as will be explained directly.

In addition to the spongy iron used in this filter, there is introduced another material called pyrolusite. This is really black oxide of manganese, the useful action of which, but in a different form, has been given. The water is first made to pass through the spongy iron, then through the pyrolusite. With large cistern filters the two materials are used (as shown by the makers) quite distinctly in separate cisterns. This filter is claimed to be specially efficacious in dealing with water which conveys zymotic diseases, bacteria, &c., in times of epidemics.

Another modified form of animal charcoal is silicated carbon. This is the material advocated and used by the Silicated Carbon Filter Company. The utility of combining silica with carbon is not at first apparent, but it is claimed by the makers that development of low forms of life, which is attributed to the plain carbon, is wholly disposed of. A somewhat well-known authority writing on the subject attributes an energetic oxidising process to this material, so that impurities undergo a chemical change and become harmless. It is a material very efficacious when used for the filtration of waters containing metallic poisons in solution.

Another modified form of carbon is carbo-calcis, the material used by Maignen's (Limited). This is carbon treated with lime, as the name implies. It is not within the province of these papers to speak more favourably of one material than another: the brief information given is almost as it is furnished by the makers' lists, and the reader must judge for himself. All the different substances named are spoken well of by different people who have used them, but Maignen certainly makes a clever filter so far as construction is concerned. Carbo-calcis is claimed to be capable of oxidising impurities and rendering them harmless; but, unlike others, this firm recommends not only the cleaning of the filtering medium, but its actual renewal periodically. To remove any objections to this arrangement easy access is provided; but what is also necessary—the renewal charges are inexpensive. The particular features in this filter are an asbestos cloth; then some exceedingly fine material deposited on the asbestos cloth by being mixed in the first water that is poured in; then the rest of the space is filled in with granular material. This filter, like most others of modern design, has provision for aeration and preventing the flat taste noticeable with water that has passed through some of the old forms of filters. This filter deals effectively with organic or inorganic impurities or metallic elements.

This is all that need be said of different substances and their peculiarities. In omitting to mention others, it is not with the idea of depreciating their value or utility. There is a firm called the Continuous Filter Company, whose motto is "Always filtering, always cleansing," by which it is gathered that the filtering medium is to be self-cleansing, dealing with the impurities, rendering them innocuous, and (they then being probably in a gaseous state) allowing them to escape. This firm informed the writer that their experiments were not fully complete, but highly satisfactory, and upon the verge of being perfect.

There are a few final features worthy of mention in regard to filters generally. Firstly, the cleansing of cistern filters. With those of modern make, and which do not use the ordinary animal charcoal, it is considered that reversing the flow of water through them suffices to remove those impurities which the filtering material has been incapable of acting upon, and certainly this arrangement, judging by the quantity of dirt that is sometimes washed out, seems effective. In doing this it is necessary to take the filter from the cistern, or wherever it is situated, and

just connect it to a pipe that will send water through it at pressure. The writer generally endeavours by some means to have them connected with a water company's mains if possible, as a high pressure is very generally obtained from this source. This, however, should not be depended upon for all time. It is not desirable to let filters even of these kinds go more than the first year without special treatment. It may not need it; but if, after one year's service, it is sent to the makers, they will (if requested) report upon its state and suggest the proper periods, judging, of course, by the state of the filter after the first year's use.

If it is proposed to buy a cistern filter from a maker, it is a good plan to submit a sample of the water to them. They can make various simple tests sufficient to advise you regarding the cleansing. Some makers issue a few simple rules and tests in their catalogues, by which the condition of a water may be arrived at with a fair degree of certainty. Other filter-makers sell small and inexpensive cases of materials and appliances, by which anyone can most simply test water for different kinds of impurities. These are especially useful in cases where water is suspected of contamination due to its having contact with certain metals or to other causes. A very useful and simple test of the purity of water can be made with Condry's fluid. If a small quantity of this be put in water, and the solution allowed to stand for, say, eight to twelve hours, its colour will determine whether the water is free from impurities or not. In the former case the fluid retains the same colour as when first mixed. In the latter case it will assume a yellowish-brown tint. The proper quantity of Condry's fluid is when it colours the water pink. It is best observed if the solution is placed in a bottle; but the bottles should be perfectly clean. It would be well to rinse out the bottom and wash the cork with some of the fluid beforehand. This material is also a capital thing to test a filter with, as to its being sound and allowing no water to pass through unfiltered. If there are unsound places, the colour of the solution will not have wholly disappeared. If the water which comes through is coloured at all, the filter is imperfect. The proportions to be mixed for this purpose is a full tablespoonful of Condry's fluid to each gallon of water.

In nearly every maker's list there appear filters that are described as being suitable for having the water pass through them under pressure. The writer does not wish to suggest that they are incapable in this respect by any means, but it is certainly better to avoid this arrangement if possible. The gain effected is in getting water through quickly; but it is in effecting this gain that a loss may occur in the inability of the material to deal with water that passes through too rapidly. Water that is practically forced through may not only effect its passage without being operated upon, but it may also carry impurities through that are continually being collected. Further than this, there is every likelihood of the water, by its somewhat violent action, forming minute passages or channels for itself; and this is far from being desirable. This possibility is one of the best of reasons for overhauling filters of all kinds periodically, if only to disturb and rearrange the filtering medium. If water under pressure has to be dealt with, then it is very desirable to have the filter of ample size—that is, with ample area of filtering medium; or what is very usual two or more filters, i.e., a battery, is used. Another form of filter likely to suffer in the same way as those used under pressure of water is that which some makers supply for use with pumps. The filter is arranged for connection to the extreme end of the suction pipe, so that the water is filtered as it passes from its source into the pipe. The intermittent action of the pump must necessarily make the filtering process less perfect than if the water passed through the filtering media regularly and, above all, very slowly.

There are certain differences of opinion as to the efficiency of loose granular filtering material as against that which is used in the form of solid blocks. Those who wholly advocate loose material suggest that the blocks have channels and passages worn through them by the action of the water, as some parts of the block may be less dense and hard than others. On the other hand, the users of block material consider that they are able to arrest and deal with practically all the impurities on the surface of the media, and a boiling, washing, and scraping is all that

needs be done for cleansing away the foul matter. Of course, the blocks are easily removable for renewal when necessary, the same as with those filters using loose material. There is one filter made which combines the two plans, and is to be admired on this account. It is furnished with block or hard ends, and granular in the centre part, the whole being encased in metal. The water has to pass through the solid portion before having contact with the loose filling.

There was a time, and not very long ago, that all filters were denounced as delusive devices, frauds in fact; but this cannot be said now. Filtering is essentially practical at present, and a high degree of skill is being devoted to the necessary appliances. The one particular feature that cannot be too strongly impressed upon everyone having filtering works to erect or control, is the provision of ample facilities for cleaning, and the actual carrying out of the cleansing that is made provision for. As before mentioned, a time must arrive when a filter, if not cleansed, will prove a source of contamination, or, if not this, it will have become choked and unable to perform its functions.

ECONOMICAL CONSTRUCTION IN CHINA.

THE constructions we see in any country at any time are the product of three factors, the resultant of three forces, the solution of three simultaneous equations—put it how we will—and these are:—

1. The materials readily available and their relative costliness.
2. The knowledge of the principles of construction possessed by the country.
3. The degree of artistic taste attained by the country and of material comfort they have learnt to expect.

These forces are all acting in their own proper directions, in each case with varying strength, and their resultant is the design and construction of every building or other structure we see. The mental exercise of determining these factors from their product is what gives such interest in viewing notable buildings, particularly when the third factor has evidently been prominent in its influence. Then the determination is the special work of the architect, and forms one of his most engrossing studies.

Where the second factor chiefly obtains, or is palpably wanting, the student of building construction as a science finds his greatest interest, and where ingenuity has been displayed in using such materials as were available, however unconventional their use for the purpose—i.e., where No. 1 has been prominent—the pioneer of partially-settled countries may well devote himself to the study of such cheap constructions.

The first of these considerations, except in ecclesiastical or public buildings, is generally the most conspicuous, and in England we can generally get an idea of the geology of any district by observing the materials of which the bulk of the buildings are constructed. In Scotland, for instance, we find in nearly every town buildings of stone, and if we walk to the first spot near the town where the rock underlying that town can be seen, we get an immediate explanation. In East Anglia a vast majority of the churches are built of flints, and a slight knowledge as to the stones most commonly found in Norfolk and Suffolk will afford evidence enough as to the reason for this.

But the readiest material to hand does not always give a clue to the structure. Until, for instance, the arch was known as a principle of construction, bricks could not be used for bridges of any length of span, however ready to hand they may have been, and we find bridges built of timber beams in cross strain, or of those enormous blocks of stone seen in some countries spanning streams, and which must have cost more to hew and move into place than a round dozen of arched spans would have cost. This great principle of construction having, however, become the property of a country, would be adapted to use the materials readiest to hand, and so we find arched bridges of stone, brick, timber, or iron, according as each is most readily available on their sites.

As to our second consideration, then *verbum sat sapienti!* A roof, bridge, or house will not be built by rule of thumb to cost £50 when a knowledge of principles of constructive science enables us to cheapen it to £25.

The present paper deals with a remarkable instance of the adaptation of materials to construction, the constructions of the poorer class—i.e., the great bulk of the people—of a country of $1\frac{1}{2}$ million square miles, and a population of 300 millions, a people who, having—to be within safe limits—2,000 years ago advanced to or suddenly acquired a civilisation, social system, and knowledge of “arts” equal to our own of a hundred years ago, have persistently maintained every minute detail of it through time, and still struggle—perhaps rightly—to do so.

In looking at a Chinaman's house we have no difficulty in at once assigning to the influence of factor No. 1 about three parts of the resultant structure. To apportion the other part between factors 2 and 3 takes more time, and may lead, if we are so disposed, to a lifetime's study of history, language, and social custom.

The great natural material everywhere ready to hand in China is the bamboo (*Bambusa arundinacea*). This plant grows freely everywhere, and more readily than our “quick-hedge” at home, while it is infinitely more adaptable to being fashioned into structures of all kinds.

The first thing a farmer does in China is to plant round three sides at least of the site of his house and steading a bamboo fence or grove, the second to cut it gradually down, and therefrom make every conceivable thing he may want, from his house itself down to his fan, opium-pipe, and chopsticks.

The bamboo can be cut from the size of the top joint of a fishing-rod to a straight, tapering mast 4in. or 5in. in diameter and 40ft. long. It is a hollow-jointed tube, as nearly round as possible, hard, strong, very light; and lest, when used as a strut, it should give way by buckling, is braced through at intervals in the most approved manner by its joints.

In China, Nature has lent herself to the toleration of ignorance or of unprogressive knowledge, and has provided on every man's land a ready-designed compression member of the best form, and a beam of nearly the best. Beginning with the house, where the plan initially is an oblong divided into three, a reception and dining room in middle, with the Lares and Penates (actual ones of wood or bronze, representing Buddhist or Taoist deities) conspicuously placed, and two bedrooms, one on either side of the reception-room. The walls and partitions are of upright posts of the larger diameter bamboo, to which are lashed with bamboo strips smaller horizontals of bamboo. Through these are intertwined still smaller bamboos, or laths of riven bamboo plastered over with clayey mud. The door is of interlaced split bamboo, with bamboo hinges. The roof is always a purlin roof. Here comes in our “knowledge of principles” clause. The “king-post truss,” with the general principle (or principal!) of framed structures, is unknown to the Chinese, and the pieces, therefore, must all be in transverse strain. Large bamboo purlins are placed longitudinally from one partition to another; rafters of smaller bamboos are lashed to these, and still smaller are overlaid longitudinally again. On these a thatch of broad leaves is laid, and the roof—the lightest, probably, constructed anywhere—is finished. The floors are generally of earth, punned hard, sometimes overlaid with “chunam,” a kind of native concrete. This finishes a house, if not warm in winter, at least cool in summer—which latter is more important in Southern China and in a country where, in cold weather, everyone carries his own private store of burning charcoal about with him in the house. Now as to furniture. The first essentials are a bed to rest (and smoke opium) on, a table to eat off, and a few chairs. These are all made, to the last ounce or cubic eighth of an inch, of bamboo. The surface of the table is a panel of bamboo clove laths split from the stems of larger diameter, laid side by side, polished side up, and framed in between whole bamboos or one whole bamboo, bent round at each corner of the table by cutting out a V-nick nearly through, and bending the cane until the mitred edges meet. This frame and panel rests on bamboo legs, with rails of smaller diameter. The bed is a flat plane of split bamboo again interlaced, resting near its ends on trestles of the same universal material. The trestle is formed by cutting out a notch in the centre of each piece forming the A's of the trestle, of such a shape that when bent around another piece—the longitudinal of the trestle—

it just embraces it, and supports it in the angle at the top of the A. These spring beds of a patent now expired, say, 1,900 years, are by no means to be despised, and the writer has, when hard pressed for quarters, or when in advance of his rear-guard, got a good night's rest out of them with a rug or coat only between himself and the laths. Certainly, they are far in advance of the iron bedstead of “modern civilization,” which has carried away below decks and leaves holes or spikes to trap or impale the weary traveller—an institution dear to the British landlady, which some of our readers may have encountered.

The inevitable mosquito curtain is slung on four bamboos over the bed, and, proving inefficient, a bamboo fan is used to ward off these direct emissaries of the devil.

To make a fan, a piece of $\frac{3}{4}$ in. diameter bamboo, two joints in length, is taken, and cut off below the two alternate joints. The upper half is then split down as far as the joint into, say, 21 or 28 thin spikes (a multiple of 7 is usual for “good joss”). These are spread out through 180° at equal distances apart, and a piece of string threaded through keeps them in place. A piece of paper is then pasted on both sides of these, and the whole trimmed off to the desired shape, and edged with paper of another colour. The fan is then ready for use by male and female alike, chiefly the former. Umbrellas are made much in the same way of the same material, and their construction is a marvel of ingenuity and patience.

We have adopted the umbrella from the Chinese (wasn't it Jonas Hanway, the City merchant, who was so wonderfully eccentric or marvellously plucky as to introduce them?) and the time may come—as it has come for a day at a time in the City—when everyone will be allowed to cool their faces, and so sympathetically the whole surface of their bodies, by the same means, instead of cooling their interiors only by iced decoctions.

For irrigation, at which the Chinese are adepts, the bamboo is invaluable. By cutting a bamboo in halves down the middle, or by cutting a notch over each joint, and there through extracting the joint an excellent water-supply pipe is made. Water-wheels also, up to 16ft. diam., are made, with the exception of the axle, entirely of bamboo, and are of most clever construction. These are used for lifting water for the irrigation of ricefields. The buckets for lifting the water are themselves joints of bamboo of large diameter—one end closed by the joint, the other open. These, working night and day, supply large areas with water, and show the value of roping in a natural force for one's own purposes, which will work on while one is asleep.

The universal tobacco-pipe of the poorer Chinese is a bamboo root and stem, about 18in. long. The root is hollowed out for the “fill,” a hot wire being put through the joints; a bit of goosequill or jade makes a mouthpiece.

Fences, short bridges, money-boxes, walking-sticks, “swizzle” sticks, sedan chairs, torches, baskets, fishtraps, hats, brushes, measures, kites, and scores of other things are all made entirely from bamboo. Bamboo shoots are eaten as a vegetable, and “Bamboo Chow-Chow” is pigeon-English for corporal punishment.

OBITUARY.

THE death of Mr. Adam Will, builder and contractor, occurred at his residence, Easter Clepington, Dundee, on Wednesday week. Mr. Will was a native of Kinrossie, Perthshire, where he was born in 1821. In 1844 he went to Dundee, and soon after entered the service of the Police Commissioners, with whom he learned the business of causeway-laying and roadmaking. He subsequently became associated with Mr. McIntosh, his uncle, a local contractor and quarrymaster. In 1849 he began business on his own account. Soon after he obtained large orders, the paving of the jetties and boat slips for the railway company at Broughty Ferry being the most important. As the city extended, many opportunities were afforded Mr. Will to increase his business. Important contracts were placed in his hands—such, for instance, as paving and drainage works in all parts of the city, the most conspicuous being the carrying out of the drainage system from Lochee to Dundee by way of Invergowrie. Mr. Will erected calendering works in North Tay-street, and extended Caldrum Works. He was also in-

trusted with the alterations and extension on North Dudhope Works, besides having to execute similar alterations and additions to other mills and factories in all parts of the city and district. The Free Church in Albert-square was also erected by him. The most important, however, of all his undertakings is the Esplanade extension, which he did not see accomplished. Mr. Will purchased, 16 years ago, an estate situated between Inverkeithing and Queensferry in Fifeshire. Since opening this quarry he has carried out large paving contracts in Montrose, Arbroath, Forfar, Perth, Musselburgh, and other places, and also supplied contractors in Leith, Edinburgh, and notably at the Forth Bridge Works. Mr. Will was also lessee of Camperdown Quarry, Lochee.

CHIPS.

The foundation-stone of a mission and settlement in Battersea, connected with Gonville and Caius College, Cambridge, was laid last week. The building, which will occupy a site at the corner of Holman and Harroway-roads, will cost £1,850. Messrs. W. and C. A. Bassett Smith are the contractors, and Mr. Martin is the builder.

The rural sanitary authority of the South Stoneham Union having applied to the Local Government Board for sanction to borrow £12,000, for purposes of sewage disposal and surface drainage for a proposed special drainage district, to comprise the ecclesiastical district of Eastleigh in the parish of South Stoneham, Mr. Thomas Coddington, M.Inst. C.E., an inspector under the Local Government Board, held an inquiry into the subject on Tuesday week. The plans had been prepared by Mr. H. J. Weston, of Shirley, whose scheme was selected by Mr. Mansergh in a recent competition.

On Thursday, the 30th ult., Major-General Philip Carey, of the Local Government Board, held an inquiry at the town hall, Folkestone, in respect to an application by the corporation for permission to borrow £3,650 for the purpose of contributing to the widening of Radnor Park Arch. Mr. Butt, of the South Eastern Railway, explained the plans prepared in the offices of that company, which show a bridge 55ft. 6in. in span, and 24ft. in height. It will cost £5,100, contributed by the railway company, the Folkestone corporation, and Earl Radnor, and will provide a widened approach to the sea front from Cheriton and other districts north of the railway.

The Hollingworth-Magniac or Colworth collection of works of art fetched long prices in the sale-rooms on Saturday, Monday, and Tuesday—£11,072 being realised on the first day, £3,415 on the second, and £18,343 on the third. The first day's sale consisted of historical portraits painted in the 16th century, chiefly of small size, many of which were attributed to Jean and Francois Clouet. The high prices realised were the more noteworthy, as in many cases there were doubts as to the originality of the portraits. Mr. Henry Armstrong, the newly-appointed director of the National Gallery of Ireland, gave, for that institution, 305 guineas for a small portrait by Holbein of Sir Henry Wyatt, in fur-lined robe and black cap. The Limoges enamels fetched high prices.

A Government inquiry was held at Oswestry on Wednesday week by Mr. Rienzi Walton, a Local Government Board inspector, before whom evidence was taken as to the Oswestry Corporation borrowing £8,000 for the purpose of finishing the reservoir at Penegwely, six miles from Oswestry, now in course of construction. Mr. Harry Rofe, the engineer of the scheme, prepared the plans, and explained that there had been a difficulty with the contractor resulting in the termination of the contract in April last.

The fine Church of St. Mary, Shrewsbury, has just been much beautified by various alterations in the chancel. An entirely new floor has been laid with encaustic tiles and polished Anglesey marble steps. The tiling is exceedingly effective, and does much credit to Messrs. Godwin and Son, of Luggwardine Works, Withington, Hereford, who have used their well-known “Antique” encaustic tiles with great success, the whole being of a pleasing and harmonious tone. A handsome stone screen has been erected between the choir and the chancel, and wrought-iron grilles have been placed in the sanctuary arcade. The architect for the work was Mr. A. E. Lloyd Oswell, A.R.I.B.A., of Shrewsbury.

Rosebery-avenue will be formally opened tomorrow (Saturday) afternoon by the members of the Improvements Committee of the London County Council.

The soirée of the Institution of Electrical Engineers was held on Friday evening in the galleries of the Royal Institute of Painters in Water Colours, Professor Ayrton (the president) and Mrs. Ayrton receiving the company.

THE SELECTED AND OTHER DESIGNS FOR THE NEW
MUNICIPAL BUILDINGS, OXFORD.

Our Illustrations.

OXFORD MUNICIPAL BUILDINGS.

We illustrate herewith the chosen design for these important buildings, which are forthwith to be erected in Oxford, and we give similar illustrations of the principal drawings of three of the other four designs submitted by the selected competitors in the final contest. We have already somewhat fully described the several schemes and expressed our opinion that the best design has undoubtedly been determined upon. Mr. Henry T. Hare, A.R.I.B.A., is the architect, as announced by us last week. We give his two principal plans and the perspective view. Next week we intend to follow these up with his details, so that the thought and skill of his composition may be more clearly seen. Mr. J. B. Hinkins, of Liverpool, shows a similar perspective view and two plans. Mr. Charles Bell's design figures best in his elevation, which we give with his chief plans, and the same compliment is given to Messrs. Cheston and Perkin's scheme. We shall illustrate Mr. E. Runtz's design next week, with further details from some of the others to-day given.

CHIPS.

The annual meeting of subscribers to the British School at Athens was held at 22, Albemarle-street, W., yesterday (Thursday), at 5 p.m., the Marquis of Bute occupying the chair.

The corporation of Berlin have resolved to incorporate the suburbs within a radius of about ten miles from the centre of the city. With this extension the number of the inhabitants of the German capital will considerably exceed three millions.

A new pavement is being brought out in the United States. Its foundation is steel plates laid in sand. These plates are 3ft. long by a ½ in. thick, and strong enough to stand a tensile strain of 50,000lb. to the inch. They are flanged on the sides and laid from curb to curb across the street. The flanges are pinned together, and the plates perforated for drainage.

It was reported to the City Court of Common Council on Thursday last week, that fresh plans had been prepared by Mr. Murray, the city surveyor, for the Central Criminal Court, which had satisfied the prison commissioners, and which would shortly be submitted to the court. It transpired that of the £1,200 required to meet the cost of removing Stevens's Wellington Monument from the Consistory Chapel to the centre of one of the arcades in St. Pauls, two-thirds has been subscribed.

Foundation-stones of a new Wesleyan chapel at Crossgates, Leeds, were laid on Saturday. It will replace a small structure built in 1882, and now to be used as a school. The new buildings consist of a chapel providing accommodation for 400 on the ground-floor, and 100 in an end gallery, with vestry. The buildings are being erected from the design and under the superintendence of Mr. Geo. F. Danby, architect, of Leeds. They are to be in the Decorated Gothic style, and built of pressed bricks with stone dressings. The width of the chapel will be 40ft., and the length 60ft. with open-timbered roof. The internal woodwork will be of pitch pine. Mr. Paul Rhodes (mason and bricklayer), and Mr. T. Harrod (joiner) have the work in hand. The estimated cost is £1,100.

WAYSIDE NOTES.

NOT finding a vast deal of interest in anything concerning architectural topics on my return, it seems as well to occupy space with some account of my final rambles in Scotland. I take it that Londoners have determined to think of nothing but the election until that troublesome event is over, and architects seem to be of a mind with the rest. If they will not take to architectural topics pure and simple, I will ignore them for this week.

I wrote last from Dumblane. It should have been part of my comment on old Dumblane Cathedral that people in that part do not altogether approve of the restoration. I heard that the building was preferred in its unrestored condition. A chance tourist through a town has no right to give any opinion *pro* or *con*. In such a matter, and I can only say, therefore, that the work appears to have been well done, and worthy of Dr. Rowand Anderson's reputation, he, I believe, being the architect for the restoration. It is much to be hoped that the beautiful west front will remain intact. It would be nothing if restored. At present it is in a glorious state. Mouldings have gone and are going, I admit; but it always appears to me that, whilst structurally sound, restoration of any kind, in any building, is wholly uncalled for.

On the way to Edinburgh I visited Stirling. Unfortunately the Wallace Memorial, of much fame, "is open every lawful day" only, and it being Sunday—an unlawful day—I could not climb the tower. Nevertheless, the view from the summit of the hill was open, lawful or unlawful, and is well worth the trouble of the ascent. Stirling looks very well standing out of the lowlands, and one can understand that it is considered a small Edinburgh. The general effect of the place, with its castle-crowned acropolis, much resembles that of the capital city when viewed from some little distance. Stirling has something in its general appearance that is in harmony with its name. The place looks solid and prosperous, and has an air of thoroughness. The old castle, famous in history, commands an extensive view of the valley of the Forth and the near range of hills and distant mountains. The river at this spot is quite a change from Highland torrents, such as the Leny, that rushes and tumbles along its rocky bed in the beautiful Pass of Leny, near Callander, where white foaming waters, cascades and rapids, and green wooded banks, overhung with grey cloud-topped mountains, make up so many delightful pictures. Here is a true Highland river. At Stirling we have an ever-flowing lowland stream that glides past the outskirts of the town, and is crossed by the renowned old bridge easily to be detected from its modern companions. The High-street at Stirling is very picturesque, and retains many of its old Scotch crow-stepped gables. At the top of the street is the old church, curiously divided into two, and used as two distinct buildings—the East and the West Church. The castle is, of course, very interesting architecturally, but its description would take much time and space.

Dunfermline came next on my route, and was well worth a visit. The visit, it is true, was more accidental than designed. It was my intention to get out of the train to Edinburgh at Dalmeny, and inspect the great Forth Bridge, and it happened to become necessary to change at Dunfermline, and wait there for a stopping train for an hour or so. An opportunity was therefore afforded for seeing the old abbey ruins, and the church and the tower, emblazoned on the parapets "King Robert the Bruce," and surmounting, I believe, the mortal remains of that monarch. Unfortunately, I could not get in the building, so contented myself with inspecting the ruins hard by, which betokened the once-existence of a very fine structure.

It was whilst leaning upon the wall of the elevated churchyard of Dunfermline, and gazing across the surrounding country, that I espied three curious triangular projections over a distant green field that rose clearly against the sky. Curious as was the sight, it, of course, did not take many seconds to realise that here was the object of my next sight-seeing essay, the three

triangles being the upper portions of the Forth Bridge cantilevers. "At last," thought I, "I see the Forth Bridge, whereof every man and woman tourist sings the praises." Dalmeny being on the south side of the Firth of Forth, I crossed over the bridge first of all; and after seeing this great work from afar and near, from the railway, from the roadway under the railway, and from the small granite pier that runs out into the river on the west side of the bridge, I must say that the most impressive effect is that of the great steel tubes and lattices as one passes them in the train, so long appear their spans and so lofty their height. Truly it is a grand work. Not the least impressive are the small girder bridges at the end of the cantilevers, which are at a dizzy height and supported on tapering granite piers which, if structurally sufficient, appear so slender as to ill-satisfy the demands of the eye.

It must often occur to many to ask how the bridge is going to pay for its erection. When one sees the amount of traffic sent over it, there is less difficulty in understanding the value of the accommodation it affords. The evening on which I was at Dalmeny saw train after train cross the bridge. It looks specially well whilst a train is thus crossing, the small dot of steam in the cantilevers giving a scale whereby the size of the structure may be gauged.

The new Edinburgh National Portrait Gallery is a very fine work. Its general appearance must be well known from illustrations. Dr. McGregor's church at the end of the public gardens is being rebuilt, and there is some nice stonework employed in the new building. The Caledonian Railway Company's new station progresses. When complete, it should be a very elaborate example of railway station architecture.

GOTH.

COMPETITIONS.

DOUGLAS HIGHER GRADE AND TECHNICAL SCHOOLS.—At the last meeting of the Douglas School Committee the designs of Mr. Thomas W. Cubbon, of Birkenhead, were selected in a limited competition, accommodation being provided for 300 children at a cost of about £1,000.

HOYLAKES AND WEST KIRBY LOCAL BOARD OFFICES.—On Monday evening a meeting of the General Purposes Committee was held for the purpose of receiving the assessor's report on the designs for the above, the result being that the plans of Mr. Thomas W. Cubbon, architect, of Birkenhead, received the first premium; Mr. Thomas Cook, of Liverpool, 2nd; Mr. Keefe, 3rd; and Mr. Ware, fourth premium. The cost of the new buildings will be about £3,000.

WOMBWELL.—In the Wombwell School Board competition Mr. C. J. Innocent, Sheffield, the assessor, recommended the designs submitted under the motto "Dux." The board on Monday appointed the authors—viz., Messrs. S. Butterworth and Duncan, 4, South-parade, Rochdale, architects, and instructed them to prepare working drawings.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

GLASGOW ARCHITECTURAL ASSOCIATION.—The usual monthly meeting was held in the rooms, 114, West Campbell-street, on Tuesday night, the president in the chair. A paper was read by Mr. Walter Watson on "Local Building Stones," in which he described the qualities of the more important examples in use in the West of Scotland. A short discussion followed, opened by Mr. D. McKerron. Thereafter a paper on "Cements" was read by Mr. F. V. Burke, who confined his remarks almost exclusively to Portland cement, pointing out the great variety in quality and consequent inaccuracy of tables giving the strengths, which are published, and that only by testing the actual example to be used can a satisfactory conclusion be arrived at. A lengthy discussion followed, opened by Mr. Hugh Dale.

Keighley Institute and Technical School has been fitted with a new clock by Messrs. Wm. Potts and Sons, of Guildford-street and Cookridge-street, Leeds. The clock shows the time upon four 6ft. illuminated dials, and strikes the hours and St. Mary of Cambridge chimes, upon about 3 tons of bell-metal.

NOTES FROM EDINBURGH.

THE building trades during the past half year seem by all accounts to have had a monopoly of profitable business, trade having been generally dull, with no immediate prospect of recovery. A large amount of important contract work is now, and for some time will be, carried on in the city and its precincts. Joiners and slaters have very recently secured a small rise in wages, having obtained a farthing per hour guaranteed for a year or so, instead of the half-penny they desired. Wages indeed are now very nearly what they were in 1874—masons getting 9d. and 9½d. per hour.

The prospects of completion for the University Hall are still remote. The erection of the roof has suspended all operations upon the interior, and the lantern or eye of the dome is not yet in its place. The workmen have finished laying the lead, of which there are 100 tons. The scaffolding is now removed; but the proportions of the hall can hardly be estimated with the interior open from the dome to floor of basement.

The new Caledonian railway station, also a work of magnitude, has been making steady progress with its shed, which, so far as its skeleton framework is concerned, is now completed. The roof is designed, with a series of sheds placed transversely to the line of railway, hipped and slated immediately over the massive wall, and then gabled and glazed, with continuous ventilation, gables crowning the erection. These sheds and their sustaining wall take a wide circular sweep on the south side towards the eastern extremity, in order to meet the verandah and entrance front, now brought forward to the street, and the dimensions of which are necessarily contracted in their width—to less than half that of the shed itself. The perspective of the range of gables to the south is not unpleasing to the eye; but the architectural appearance of the entrance loses much by the determination of the directors to have the entrance as it is. The architectural design of the verandah, side and front, though in all respects excellent, will appear to less advantage than if it had been 50yds. further from the street. Possibly the present arrangement may be a necessity, in view of the ultimate construction of the Prince's-street tunnel, connecting the Caledonian line with Leith.

The carriage-way division of the entrance is completed, or nearly so, but the rest must wait till the traffic can be provided for on the south side. The foundations for the boundary-wall in the line of the Lothian-road are being laid in concrete at a depth of about 20ft., and still uncompleted, and till this wall is built no further progress can be made with the entrance front. The façade of the carriage-way is being roofed with lead, and is in itself a sample of street architecture, of a piece with the best old Classical work of the New Town. The entrance front is designed in the monumental style of the triumphal arch, and the Lothian-street elevation corresponds to it with good effect. A massive entablature and corner is carried on twin pillars, with large circular-headed lights between. These windows are lofty in their proportions, and have lintels at the springing of the arch. The two mullions below are carried up above this lintel into the arch, in the form of caryatides, or with female heads affixed to volute projections for the bust. This ornamental device, whatever it may signify, has been happily selected, and the whole, so far as it has gone, is as good an example as may anywhere be seen of the capabilities of well studied proportions and simple sub-divisional details, without any of the vagaries too frequently found in many unfortunate endeavours to improve upon the regular methods of design.

The work of demolition of the old West Kirk has been going on apace, and has now left exposed the only portion to be retained—viz., the tower and spire. Most people will not fail to be struck with the very elegant proportions of this, the only piece of architecture about the church as it was. As a sample of a Classical spire, it is far before anything of Sir Christopher Wren's, numerous as are his designs. The idea of piling up one stage upon another to get the necessary altitude is not at all apparent here, and the rather squat proportions of the stages between tower and spire are just the excellence of the whole. Unfortunately, this elegance of proportion will be lost in a great degree by the juxtaposition of the new and larger edifice.

The civic authorities have in contemplation a

small improvement scheme (to cost, however, about £20,000), by which the contracted thoroughfare of Bristo-street, where it intersects the Lauriston thoroughfare, will become an open space, thus exposing to view the Students' Union building, and allowing the eastern end of the university, and especially the hall, to be seen to advantage. Ostensibly the object in view is to accommodate the heavy traffic which passes at present through a street where two carts can barely pass each other. The managers of the infirmary having resolved to carry out the more expensive plan of enlarging their accommodation—which includes the purchase of the Sick Children's Hospital—that institution is to be provided with new quarters further south. Nothing appears to have been decided as yet as to the enlargement of the County Chambers. The Town Council have embodied their suggestions in a plan—which does more justice to the elevation in George IV. bridge than the plans at first approved by the County Council,—but which retained the present character for that elevation as the back of the building.

The purification of the Water of Leith work has been much delayed by unexpected obstacles. The line of sewer is nearly completed, but in the Leith district there still remains much work to do, and the contractors have obtained an extension of time for the completion of the contract.

The exhibition of the Society of Scottish Artists has been open for some time, and may be said to have been fortunate in securing the appreciation of the public. As a whole, it forms a much more attractive exhibition than that of its elder brother or rival, the R.S. Academy. The walls are not crowded with the pictures of all and sundry, the statuary is disposed of through the rooms—and there are numerous examples of eminent artists, which, by the rules, could not be seen in the Academy Exhibition. Painting of the artistic sort is now so general as an accomplishment, that purchasers are not easily found for the multitude of pictures the creation of the professional artist's fancy and skill, and anything that promises a chance of bringing such works under notice of a purchaser is more than ever a matter of necessity. A medium for advertising, better than this auction room, is attained by this Society, which has made a good beginning.

CHIPS.

The Bishop of Lichfield laid, on Saturday afternoon, the foundation stone of a new infirmary to be erected by the Lewisham Guardians at a cost of £60,000. In the afternoon the Countess of Dartmouth laid the foundation stone of the new church of St. Swithun, Hither-green, Lewisham. This church is being built from the designs of Mr. Ernest Newton, and was illustrated by a bird's-eye perspective and plan in the BUILDING NEWS for Aug. 16, 1889.

The Bishop of London distributed, on Monday, the prizes to the students of the engineering and general literature departments of King's College.

A special meeting of the county council for Dumbartonshire was held at Dumbarton on Friday, when the sub-committee appointed on the question of enlarging the present county buildings reported that they had selected the plans of Mr. D. M'Naughton, architect, Glasgow, which show improved accommodation for all the county officials. Estimates had been obtained, and the committee recommended the acceptance of the lowest, amounting in all to £8,753 0s. 10d. The report was adopted.

Haddington Abbey, which during the past nine months has been undergoing a complete renovation, was reopened on Friday. The alterations have been carried out at a cost of over £5,000, principally raised by subscription. The architects were Messrs. Hay and Henderson, of Edinburgh. An organ is being erected at a cost of £1,000.

The latest improved ventilators of Messrs. Baird, Thompson and Co., London and Glasgow, are being adopted in connection with the improvements at the Glasgow prison.

A large clock has recently been sent out to Nagercoil by John Smith and Sons, Midland Clock Works, Derby.

The annual meeting of the Royal Archaeological Institute will be held at Cambridge from Aug. 9 to Aug. 16. Excursions will be made during the week to Bury St. Edmund's, Audley End, Saffron Walden, Lynn, Castle Rising, and the Fen churches.

Mr. T. G. Jackson, A.R.A., will lecture at Toynbee Hall on Wednesday next, July 13, at 8 p.m., on "The Architecture of the 15th Century."

Building Intelligence.

BATLEY.—The memorial-stones of the Public Baths and Technical Schools in course of erection at Batley were laid on Saturday. The site for the baths is between Cambridge-street and Wellington-street. The dimensions are to be 134ft. by 126ft. The walls externally will be of Delph stone, lined with white, brown, yellow, and black glazed bricks. The first-class swimming-bath will be 75ft. 6in. by 33ft. 6in. A second-class swimming-bath will be 85ft. by 45ft. There are to be twenty slipper-baths, which will be divided into first and second-class. Rooms are reserved for Turkish baths. The cost is estimated at £8,000. The plans have been prepared by Mr. W. Hanstock, of Batley. Messrs. T. Bradford and Co., of Manchester, and Messrs. J. Bagshaw and Co., of Batley, are the engineers. The mason's work is being done by Mr. Isaac Nelson, and the joiner's work by Mr. Henry Brooke. Mr. Joseph Hepworth is clerk of works.—The technical school was also designed by Mr. Hanstock. The site is opposite that of the baths. The building will be three stories high, and will accommodate 300 students. The design now being carried out is arranged so as to allow for the duplication of the building at some future time. The structure, exclusive of fittings, will cost about £3,500.

HAYDOCK, LANCs.—The parish church of Haydock, near St. Helen's, has been consecrated by the Bishop of Liverpool. The church was erected from plans prepared by Messrs. Douglas and Fordham, of Chester, and the total cost was about £4,300. It stands by the side of the old and inconvenient parish church which now forms an aisle. The most prominent feature of the new fabric externally being a fine central tower with an octagon spire 90ft. high. The upper part of the tower contains a belfry chamber. The building itself has an oak-timbered framework filled in with brickwork in order to guard against any future subsidence of the land through the coalmining operations in the district. The total length is about 170ft., and the width, including the old church, with which it is internally connected by an arcade, 72ft. The floor of the church is of wood, and accommodation is found for nearly 600 worshippers. The contractor was Mr. Thomas Browne, of Chester.

GOOSE GREEN, DULWICH.—The first of the public baths and washhouses for Camberwell were opened on Saturday. The baths are adjacent to the Dulwich Reform Club, and face Goose Green. The first-class bath is 120ft. long by 35ft. wide, by the usual depth, and contains 130,000 gallons of water. The second-class bath is 90ft. by 35ft. wide, and holds 100,000 gallons. There are 60 slipper baths. The architects are Messrs. Spalding and Cross, who have also in hand erection of baths for the same vestry at Camberwell Green.

On Friday night the workmen in the employ of the Southampton Corporation presented the borough surveyor, Mr. W. B. G. Bennett, with an illuminated address, on his recovery and return to duties after a severe accident, and in token of appreciation of 16 years' service.

A valuable addition to the Greek collection of antiquities at the British Museum has just been made in the form of ten Athenian vases. There are three kylixes, two certainly being by Sotades. The subjects are Polyseidos immured in the tomb of Glaucos, son of Minos, a girl plucking fruit from an apple-tree, and a man holding a club and facing a serpent. All three have for the ground a pale cream-colour, with the figures drawn in a warm bistre. There are three other kylixes with red figures, a stamnos by Smikros, a white Athenian lekythos, and two in alabaster. The vases, with two others now in the Brussels Museum, were discovered during the construction of a sewer in Athens in 1890, and were purchased for the Bloomsbury collection from Mr. A. Van Branteghem.

The Bishop of Dover visited Folkestone on the 27th June and conducted the opening service at the new church of St. Saviour. At present there are only the chancel, the first bay of the nave, organ chamber, and vestry erected. It is proposed to add a tower and spire and a southern transept. The entire work will cost £10,000, and that of the present section of the building was £3,000. The style of the church is Early Gothic, the material is Kentish rag laid in courses, and the plans were designed by Messrs. Somers Clarke and Micklethwaite, of London. The builder is Mr. William Dunk, of Folkestone.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 832, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL, XLII, XLVI, XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—W. R. M. and Co.—S. G. T.—Romano.—J. R. Wilcox.—B. R. G. (Sunderland).—Scotia.—C. M.

COMPETITIONS.

To the Editor of the BUILDING NEWS.

SIR,—I have been waiting to see if your leader of the 24th ult. would draw out any remarks from older competitors than myself, upon the conduct of competitions—more especially with regard to the fulfilment of the duties of assessor.

I rather wonder that all we have lately had the opportunity of reading upon this "main difficulty" has not suggested a practice followed by one or two professions. Why not make it more common to appoint two or more assessors known as being specially qualified for the particular class of work for adjudication? It need not be at greater extra cost than in the other professions. I am supposing cases of large and important works, as may lately be instanced, which—though, I fear, disregarded by the majority of the public—ought not to be considered of less importance than a "special case" in medicine or law, when often more than one of the best and most skilled authorities are sought and obtained.—I am, &c., M. R. ELLERTON.

A Wesleyan chapel in Gravel-lane, Salford, was opened last week. It is seated for 1,100 persons, and adjoining are two vestries, a lecture-hall, coffee-bar, and library. Mr. Walter Sharp, of Manchester, was the architect.

At the local board offices, Colwyn Bay, on Friday, Colonel W. M. Ducat, R.E., Local Government Board inspector, held an inquiry into an application by the local board for sanction to borrow £5,853 for the construction of the subway, the widening of Eirias Bridge, the construction of a footpath to Old Colwyn works of water supply, street improvement, and the purchase of a fire-engine.

Intercommunication.

QUESTIONS.

[10800].—Blackboard.—Will any of your readers kindly tell me how to make a blackboard, such as they use at schools for explaining arithmetic, &c., on? The one I have made retains the chalk marks, which will not wash out, but leave the board scratched.—BELGIQUE. [1]

[10811].—Wet in Coach-House.—Lean-to roof of coach-house, rise 4ft. on 18ft., covered with slate, no ceiling. No window or ventilation. Wet comes through after frost. Will someone suggest remedy?—G.

[10802].—Cracking of Boiler Masonry.—We have been very much inconvenienced by the cracking of masonry (brickwork) in which several boilers are set here for the cooking of pig's food, &c. Can you suggest a means whereby this may be avoided?—JOHN A. WALLIS, M.D., County Asylum, Whittingham, Preston.

[10803].—Planning a Roof.—Information is desired how to find and draw correctly on plan the position of hip and valley rafters for a roof. Must they always be at angles of 45° degrees on plan with the ridge; or can they be at any angle? Imagine a building having eight gables of different heights, and the eaves at different heights, and six hipped dormers half-way up the roof; the pitch of the main roof being much steeper than the gable roofs, and the dormers being the same pitch as the gables. How to plan hips and valleys?—CARPENTER.

[10804].—Heraldry.—Will any of my fellow-readers who may be familiar with the neighbourhood around Maidstone kindly give me a list of places where I may find heraldic subjects of a good class, as mediæval tombs, brasses, painted glass, and such-like? I want to make Maidstone the base of operations, an elderly relative staying there, while I take daily excursions, distances within a moderate bicycle run on an average; time available ten days or a fortnight.—BEND ON.

[10805].—Arch.—To arch with bricks a passage-way 24ft. by 12ft., strong enough to carry heavy casting and ballast. I wish to know the best pitch and form of arch, the size of bricks and how laid, and treatment of the side walls under ground to the abutments?—A READER.

[10806].—Cleansing Brick Interior of Church.—I have the interior to cleanse, repaint, and varnish, &c. The brickwork is very dingy, and in parts smoked by the gas. What is best to do with it? It is of picked stock bricks of the London district, with struck and cut joint, rather rough; but the joints are too sound to warrant raking out and restopping with joints of same class, as at present, and I do not like the other alternative of raking out and tuck pointing, which offers a sham joint, out of place in a church. The arches are gauged work of red and black bricks. The joints of the stock brickwork are rather ragged at the edges, so that they cannot well be lined out with any colour. What is usually done with brick interiors? They appear to me to be rather difficult to deal with, and yet they occur so frequently that the difficulty must have often been considered.—R. Y.

REPLIES.

[10791].—Inaccessible Distance.—

NMP, NOM, and POM being all right angles.

$$MP^2 + MN^2 = NP^2, MN^2 = MO^2 + NO^2, \text{ and } MP^2 = MO^2 + OP^2.$$

$$\text{Then—} NP^2 = (MO^2 + OP^2) + (MO^2 + NO^2).$$

$$\text{But—} NP^2 \text{ is the same as } (NO + OP)^2.$$

$$\therefore (NO + OP)^2 = 2MO^2 + OP^2 + NO^2,$$

i.e.,—

$$NO^2 + 2(NO \times OP) + OP^2 = 2MO^2 + OP^2 + NO^2.$$

$$\text{Take away—} NO^2 + OP^2 \text{ from each side,}$$

$$\text{and } 2(NO \times OP) = 2MO^2$$

$$\therefore NO \times OP = MO^2$$

Divide each side by NO,

$$\text{and } OP = \frac{MO^2}{NO}$$

—NORTHMAN.

[10791].—Inaccessible Distance.—By construction PMN, MON, and MOP are right-angles; $\therefore PMN = PMO + OMN$, take away the common

angle OMN leaves PMO = MNO, and angle MPO = OMN. The angle MOP is equal to MON. \therefore the triangles MOP and MON are similar and their sides

$$\text{proportional, i.e., } ON : OM :: OM : OP. \therefore \frac{OM \times OM}{ON} = OP = \frac{OM^2}{ON} \text{—J. Y.}$$

[“J. W. G.” Thomas Winn, jun., and “T. C.” have also replied similarly.]

[10795].—Warmington Church, Northants.—In “The Churches of the Nene Valley,” by the late Mr. Edmund Sharpe and Messrs. J. Johnson and A. H. Kersey (published by Batsford, 1880), there are two large sheets (11in. by 14in.) of details of this church. These embrace (plate 8) an elevation of an arcade of six bays, and details of same, all drawn to scale; and (plate 71) the south porch doorway, with details. The mouldings being given a quarter full size. All the work is very beautiful and refined. “The Churches of the Nene Valley” is a book no one should be without.—HARRY HEMS, Exeter.

[10797].—Warming Entrance Hall.—In reply to “Holdfast,” it is quite possible to heat the hall from kitchen boiler, provided he can obtain a continuous rising flow, the coil in hall being at least 2ft. above the boiler, otherwise it will not work properly.—J. G. GREY.

[10799].—Size of Sewers.—Like “Invert,” I have never met with any formula for direct finding of the size of a sewer when the length, inclination, and discharge are given, and therefore venture to submit the following, which I have deduced from the formula—

$$V = 59 \sqrt[3]{H \cdot R}$$

where V = velocity in feet per minute,
H = fall in feet per mile,
R = mean radius.

This I have used in place of the more cumbersome one by Weisbach, and will be found to give practically the same results for velocities between 2ft. and 6ft. per second, and is rather more accurate than that of Eytelwein. (1) For egg-shaped sewers, in which the transverse diameter = $\frac{2}{3}$ vertical, and invert radius = $\frac{1}{3}$ transverse diameter. Take Q = discharge in cubic feet per minute, or area \times velocity; R = radius of upper portion of sewer in feet; a, a constant = 4.5941825 for sewer flowing full, 3.0433325 if $\frac{2}{3}$ of depth full and 1.136 if $\frac{1}{3}$ depth full; b, a constant = 0.579344 full, 0.6314 $\frac{2}{3}$ full, and 0.4132 $\frac{1}{3}$ full; H as before. Then—

$$Q = A R^2 59 \sqrt[3]{\frac{2 H}{b R}} \text{ and } R = \sqrt[3]{\frac{Q^2}{6728 a^2 b H}}$$

The formula referred to. As an example of its application, assume it be required to find the size of an egg-shaped sewer of the proportions stated to discharge 1,350cft. per min. with a fall of 8ft. per mile when flowing $\frac{2}{3}$ (of depth) full. Applying these data we have—

$$R = \sqrt[3]{\frac{1350^2}{3889755 \times 8}}$$

$$R = 1.4245ft., (= \text{about } 1' 5")$$

That is to say, the sewer would require to be 2' 10" \times 4' 3". (2) For circular sewer: The constant a for this would be, if running full, 3.14159; $\frac{2}{3}$ (depth) full, 2.225; $\frac{1}{3}$ (depth) full, 0.916; and the constant b 0.5 if full; 0.58227, $\frac{2}{3}$ full; and 0.372, $\frac{1}{3}$ full. Taking the data and conditions as before, required size of circular sewer to do the work—

$$R = \sqrt[3]{\frac{1350^2}{19394 \times 8}}$$

$$R = 1.63675$$

\therefore sewer would require to be 39in. diameter. The constants a and b are the areas and H M.D. respectively of a sewer under various conditions of flow, whose radius equals unity.—F. E. GAY, Bath.

CHIPS.

On Wednesday week the funeral of Mrs. Caroline Cooper, of Hanningfield House, Lausanne-road, Nunhead, relict of the late Mr. John Cooper, for many years in a large way of business as a builder at Charing Cross, took place at Nunhead Cemetery, in the family grave. The deceased was in her 78th year.

A statue of Joan of Arc was unveiled at Rouen on Thursday, the 30th ult. The Maid of Orleans is standing bareheaded, her hands bound, and her hair cut short, as she must have been when led to the stake. The statue is placed on the hill of Bon-Secours.

At Bexhill-on-Sea on the 30th ult., the restored belfry, new bells and rood screen at St. Peter's Church were dedicated. The works have been carried out from the designs of Mr. Thomas Parratt, of Shepherd's Bush, W., and the screen has been executed by Messrs. Harry Hems and Sons, of Exeter.

At a vestry meeting held at Gravesend on the 30th ult., plans by Mr. Smith of that town were adopted for the restoration of St. George's Church, Gravesend, at an estimated cost of £1,000.

Drapers' premises at Chelmsford have just been extended by the absorption of a bank, the front of which has been rebuilt, and the interior remodelled. Mr. F. E. L. Harris was the architect, and Messrs. Moss and Co. were the builders.

The group of six portrait heads of men and women by Hogarth, which Sir F. Burton purchased at the Wedderburn sale the other day, has been hung in Room XVII. of the National Gallery, and numbered 1371. It is called “Hogarth's Servants,” and seems to be the picture which was No. 80 at the British Institution in 1817. It has not been exhibited since 1817, nor engraved.

The additions to the Warwick county lunatic asylum are nearing completion, and are being warmed and ventilated by means of Shorland's patent Manchester stoves and patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

Legal.

HOUSE AGENTS' COMMISSION.

DISPUTES are constantly occurring as to what introductions will entitle a house agent to claim his commission upon the sale of a house. In several cases it has been held that if an agent is employed to let or sell, and he introduces a tenant who afterwards becomes the purchaser of the house in question, he can legally recover commission upon the sale. But then there must be a clear engagement on the part of the owner with the agent to sell as well as to let, and certainly the sale to the tenant must take place within a reasonable time after the letting. These points were again raised in the recent case of "*Gillow v. Lord Aberdare*" (*Times*, July 2), which is also interesting in so far as the custom in this regard was considered by the Court. The plaintiffs' case was that they had been employed to sell as well as to let a house for the defendant at Queen's Gate, and that they obtained him a tenant who afterwards became a purchaser, and they now claimed payment of £225 as commission upon the sale, less the sum of £63 received by them upon the letting, and for which they wished to give credit to the defendant. The evidence that the plaintiffs were employed to sell as well as to let came to very little in the opinion of Mr. Justice Hawkins, who held that there was no contract of this kind to go to the jury, while the learned judge also decided that the plaintiffs could only get their commission on the letting, which had been paid, especially as there was nothing in the tenancy agreement about any option to purchase, thus showing that a sale was not at that time in the minds of the parties.

The real contest in the case was, however, upon the question whether or not such a custom existed in regard to house agents and their commission. It was objected that this could not be gone into, as it had not been raised in the pleadings; whereupon leave to amend was applied for by the plaintiffs, and, as a fact, some evidence was heard. Two firms of estate and house agents swore to a general custom that if an agent is employed to let or sell a house, and he lets it to a tenant who afterwards buys, he is entitled to a commission on the sale. But one witness laid it down that this depends on the agent being clearly instructed to let or sell; and he admitted that the custom would not apply if employed to let only; nor would it come in if the agent had been paid his commission on the letting. The other witness appeared to think it affected letting a furnished house only, and did not depend upon an employment to let or sell. The Judge decided against amending to bring in such evidence as this, and he also protested against the conclusion that because an owner replies to a circular sent him by a house-agent asking the price, the agent is thereby employed to sell as well as to let, and so can claim commission. As far as this case goes, the alleged custom has not yet been established; though there may probably be an appeal.

FRED WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning to insure answer same week.

BOS.—PARTY WALL.—AGREEMENT.—If, as you say, the adjoining owner agreed to pay you half the cost of the party-wall you built when he came to use it for his own house, you can now sue him for the money in the County Court, as he has refused payment.

ARCHITECT.—CONTRACT.—ERROR.—The difference in value of the work actually done and that agreed for should be deducted from the balance owing. The architect could only be made liable on the ground of negligence, if the facts supported such a contention. If the employer only pays for the work that was done, there would not seem to be any further damage that he could recover.

The premises until recently used as the post office, Chertsey-road, Woking, are to be converted into a political club, from plans selected in competition, by Mr. Clamp, architect, of that town.

The corner-stone of a new church was laid last week at Cudworth. The church, which is to accommodate 250 worshippers, is to be in the Early Decorated style, from designs by Messrs. Smith and Brodric, of Goole and Hull, and is being built at Upper Cudworth. The contract has been let for £2,340 to Messrs. Benj. Graham and Sons, Huddersfield.

LEGAL INTELLIGENCE.

HEAVY ARCHITECTS' FAILURE ON TEESIDE.—Mr. Christopher Moses, architect and surveyor, North Ormesby, Middlesbrough, was examined in the Stockton Bankruptcy Court on Wednesday week, and said his net liabilities were £19,801 4s. 1d., and he only estimated his assets at £3 2s. 7d. He retired from his profession 17 years ago, and was worth £17,000. He built a considerable portion of South Bank, and for some time saved £3,000 a year apart from his living expenses, but he had lost all his money and had been rendered insolvent to the amount stated on account of speculations in various companies which had not proved successful, and calls in connection with which had been made upon him. Amongst the companies were the Deckham Hall Land Company, the Cumberland Road Metal Company, and the Commandale Brick Company. The examination was adjourned.

HULL CORPORATION V. TURNER AND OTHERS.—Court of Appeal, June 30 and July 1, before Lord Esher, Lord Justice Bowen, and Lord Justice A. L. Smith.—This action was brought by the corporation of Hull against the contractors for the main sewers of the town and their sureties for damages caused by the contractors' bad and, as alleged, fraudulent execution of the works. The jury had in effect found that the contractors had been fraudulent (and as against them there was judgment), but that the corporation engineer was in fault in not duly inspecting the work before certifying for it, and, as the sureties were innocent, the question then arose whether or not the sureties were exonerated. It appeared that in June, 1888, the contract was made between the corporation and the contractors. The works were completed on April 18, 1889, and the borough engineer duly gave his certificate of completion, more than six months before Feb. 7, 1890, when he gave his final certificate, and the amount of the contract, £6,600, was paid. After this, however, the corporation appointed a committee of inquiry, who were satisfied that the work had been "scamped," and it came out that the inspection of the works had been left by the engineer to the clerk of the works, from whose oral statements the engineer had given his certificates, and that the clerk of the works had been deceived. The brickwork was, it appeared, shamefully done, and it was found necessary to do much of the work over again. The corporation then brought the present action against the contractors and their sureties, £7,000 damages being claimed. At the trial before Mr. Justice Grantham evidence was given of all this, and the learned Judge gave judgment against the contractors, the amount to be determined by a referee, and declined to stay execution. As to the sureties, he reserved the question of liability upon these findings of the jury. Upon further consideration, however, the learned Judge gave judgment against the sureties, who appealed. Mr. Channell, Q.C., on behalf of the sureties, contended that as they were innocent, and even the engineer was not a party to the fraud, they were entitled to set up the certificate of final completion. Mr. Forbes, Q.C., and Mr. E. T. Atkinson, Q.C., on behalf of the corporation, contended that they were entitled to judgment against the sureties, as the effect of the fraud was not to exonerate the sureties. Their lordships gave judgment on Friday, when they unanimously dismissed the appeal.

A SWINDLER OF TIMEKEEPERS.—Henry Humphrey, aged 43, of no occupation, was convicted at the Central Criminal Court on Friday, of conspiring with a man named Wilson to defraud Arthur Ward of the sum of £30, and also of obtaining large sums of money from others. For some considerable time past prisoner had been engaged, in conjunction with a man named Wilson, who has absconded, in a systematic course of swindling young men by obtaining from them sums of money, ranging from £30 upwards, as security on the pretence of procuring them situations as timekeepers, at wages of 35s. per week. No work was done, and, consequently, no wages were forthcoming. When arrested Humphrey was superintending some building works at Putney. Mr. Commissioner Kerr sentenced him to twelve months' hard labour.

WATER SUPPLY AND SANITARY MATTERS.

SALFORD.—The committee of the Salford corporation having charge of the sewage works at Mode Wheel have decided to throw the works open for public inspection on Monday and Tuesday next, the 11th and 12th inst. Several systems of purification are being experimentally tried, and information may be gained which may possibly be of value to local authorities interested in the sewage question.

It has been decided, in view of the general election, to postpone the joint annual meeting of the Gloucestershire and Wiltshire Archaeological Societies at Cirencester from Tuesday, Wednesday, and Thursday in next week to August 23rd–25th.

Our Office Table.

THE week's elections have been disastrous to those architects who were seeking Parliamentary honours. Major Isaacs has lost his seat for Walworth, and all the other architects have failed in their attacks—Mr. H. H. Bridgman at Taunton, Mr. Chatfield Clarke at Grantham, Mr. Banister Fletcher at Christchurch, and Mr. Arthur W. Soames at Ipswich. Mr. John Aird, the contractor, easily retained his position at North Paddington; but Mr. J. T. Firbank was unsuccessful in Haggerston. Many who do not sympathise with his political views will regret that Dr. B. W. Richardson was defeated at Walton, Liverpool.

AN ingenious and novel way of advertising on the part of architects seems to have met with an untimely end at Boston, U.S.A., where, it seems, the subject has caused a regular tempest in a teapot. Messrs. McKim, Mead, and White are the architects of a new public library, and the trustees instructed their architects to arrange a series of tablets along the façade of the building, with names of distinguished authors, musicians, and artists inscribed thereon. The authorities gave their architects the choice of about six hundred names to select from and arrange in such a manner as might impart interest and the most artistic effect. The choice resulted in the facetious advertisement which gave so much offence. It began: "Moses, Cicero, Kalidasa, Isocrates, Milton," giving the initials of the leading partner, "McKim." This acrostic jumble naturally enough upset the Boston people, and so did the continuation, which ran: "Wren, Herrick, Irving, Titian, Erasmus," and furnished the name of "White." How Mr. Mead's name was contrived we are not told; but the trustees had the advertisement removed, and are making their own selection. All is peace now in that city.

MR. VEREKER, the British Consul at Cherbourg, whose interest in road-making is well known, and is often revealed in his reports, refers in his last report to the extraordinary growth in the trade in macadamised stone between that port and this country. This export, which in 1890 increased tenfold over 1889, has trebled from 1890 to 1891 (when it amounted to nearly 30,000 tons), and, still in its infancy, is capable of almost unlimited expansion. Much, however, remains to be done to give it legitimate impulse; it is imperative that a tramway be established from the quarries in the Montagne du Roule to the shipping quays, thus avoiding the expense and delays of cartage from the quarries; that cranes be erected on the quays so as to insure rapid shipments; and that more powerful and effective machinery be erected at the quarries. Towards these necessary improvements something has to be done. A concession has been granted to a French company to lay a tramway along the Rue du Val de Saïre, from the point where it meets the road from the quarries and round the quays; the lessees of the quarries have agreed to construct a tramway from the quarries to meet that to the quays, and it is hoped that during the present year the work will be completed, and thus considerably promote the exportation of macadamised stone.

THE *Scientific American* gives the following recipes for wood. For yellow, paint the wood with a hot concentrated solution of picric acid, dry, and polish. Care must be exercised in the use of this stain, as the picric acid is poisonous. For grey, apply a solution of one part silver nitrate in fifty parts of distilled water, then coat with a solution of ferric acetate until the proper shade is obtained. This preparation must not be allowed to touch the hands. To stain wood a rich purple, boil 1oz. of madder and ½oz. of fustic in two gallons of water, and when boiling brush over the wood until stained, then with a weak solution of nitric acid, and finish with the following:—Put 9oz. of dragon's blood and 2oz. of soda, both well bruised, into six pints of spirit of wine. Let the mixture stand in a warm place, shake frequently. In using it lay on with a soft brush, repeating the coats until a proper colour is gained. Polish with linseed oil or finish with varnish.

AN Algerian Pompeii has been revealed by recent excavations among the ruins of the Arab city of Timgad, in the province of Constantine, a

town built in the first century of the Christian era, and devastated by the Moors and by earthquakes in the sixth century. Like Pompeii, Timgad has preserved the pavement of its streets, with ruts made by the chariot wheels, a forum with a number of statues, a basilica, a tribunal of commerce, several temples and public halls, a theatre with seats for the spectators, galleries, and entrance places for the public and the actors, fountains, baths, and a covered market with granite tables still in their places. To the south-west of the town, upon a hill, rises a temple of colossal dimensions, surrounded by spacious porticoes. This building, dedicated to Jupiter, is now being excavated, and the friezes, balustrades, and heads of the columns are already clear of earth, while the fragments of a colossal statue have also been brought to light. A broad paved road still traverses the city from east to west, with several triumphal arches spanning it, one of which, built by Trajan, and with three gateways through it, is still intact. There is also in Timgad the Byzantine citadel, constructed in haste by the troops of Solomon, the successor of Belisarius in Africa, out of the debris of the southern part of the city, several Christian basilicas, and other buildings which are to be excavated.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—St. Paul's Ecclesiological Society. Day visit to Canterbury. Train from Victoria. 10 a.m.

MONDAY.—Royal Institute of British Architects. Business meeting. 8 p.m.

WEDNESDAY.—Toynbee Hall. "The Architecture of the 15th Century," by T. G. Jackson, A.R.A. 8 p.m.

Trade News.

WAGES MOVEMENTS.

BIRMINGHAM.—The demand of the builders' labourers for an increase in their wages, simultaneously with that conceded to the bricklayers, was followed, as threatened on Thursday in last week, by a general strike, which, however, soon ended, as it was agreed to resume work on Wednesday, pending arbitration by Mr. Colmore, the stipendiary magistrate, who also acted in the same capacity in settling the bricklayers' dispute.

BRISTOL.—On Saturday afternoon representatives of the masters and bricklayers met at the Guildhall with the hope of settling the difference which has caused the present strike; but the men declined arbitration and adhered to their terms—namely, 4d. per hour increase, which was conceded before the strike, and one hour for dinner during the winter months instead of half an hour. As neither party would give way, the master builders decided no longer to acknowledge the rules agreed upon and signed more than two years ago between the Master Bricklayers' Association and the operative bricklayers. The rules as they stand at present, with the exception of 4d. per hour advance in wages, still hold good with the masons, plasterers, and labourers. The masters have since decided to give the 4d. advance as from Friday last, July 1st, instead of August, as awarded by the arbitrator.

COLCHESTER.—The strike in the building trade, which seemed to have been settled a month ago, but was reopened, is not yet ended. The men asked for 1d. rise in two instalments, and a new code of working rules; the employers absolutely refuse to entertain the proposal of an advance, but offer to arrange a new code.

SHEFFIELD.—The dispute in the building trade in Sheffield is at an end, and the masons affected resumed work on Saturday. The difficulty was brought about by the masons asking the employers to sign a code of rules. On meeting with a refusal to do this they struck work. The Master Builders' Association offered to refer the matter to arbitration, but the men absolutely declined to entertain the proposal. The masters have now acceded to their demand, and accepted the new rules.

Alterations have been made to the Royal Naval Club, Portsmouth, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air, and fresh air admitted by their improved air inlets.

Mr. J. T. Beckham, of Low Ousegate, York, has just completed three figures carved in oak for the roof loft of Holy Trinity Church, Bury, Lancashire. The figures illustrated are the Crucifixion. The Crucified will form the central figure, whilst the Blessed Virgin and St. John are to be placed at either side.

CHIPS.

Plans for a new export dock to be constructed at Barry, prepared by Mr. J. Wolfe Barry, M.Inst.C.E., have been adopted by the Barry Dock Co.

Some sixty employes of Mr. F. Britton, builder, Highbury, journeyed by brakes last Saturday to St. Alban's, the occasion being the celebration of their fourth annual beasfeast. A good repast had been prepared by the proprietor of the "North-Western," which was followed by various toasts and speech-making in honour of the firm and the worthy employer who, as usual, was unanimously elected to the chair. The remaining portion of the day was pleasantly spent by cricket and a run round the historic abbey near by.

The foundation stone of a new Wesleyan chapel was laid on Wednesday week in the village of Dishforth, near Ripon. The building has been designed by Mr. Thomas Stokes, of Thirsk, architect. It will be Gothic in style, built of brick, with stone dressings. The interior woodwork is to be of pitch-pine, with seats for 120 persons. There is also to be a commodious schoolroom. The total cost will be about £550. The contractor for masonry, brickwork, and plastering is Mr. William Jackson, of Thirsk.

Holloway's Ointment.—Go where you may, in every country persons will be found who have a ready word of praise for this Ointment. For chaps, chafes, scalds, bruises, and sprains, it is an invaluable remedy; for bad legs, bad breasts, and piles, it may be confidently relied upon for effecting a sound and permanent cure.

DOULTING FREESTONE.
THE CHELYNCH STONE.—The Stone

on these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to **CHARLES TRASK and SONS**, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—**THE HAM HILL STONE COMPANY**
NORTON, STONE-UNDER-HAM, SOMERSET.

Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—**T. PETTITT and CO.,** Lithographers, 28, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT,
TEAK, VENEER, and FANOYWOOD
MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

* * Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BATTERSEA, S.W.—For drainage works at Winstanley-road school, for the London School Board:—

Charteris, D.	£516	0	0
Lathey Bros.	348	0	0
Hammond, W.	332	0	0
Holloway Bros., Battersea	329	0	0

* Accepted.

ACKWORTH.—For enlarging rectory house, Ackworth. Mr. Wm. Watson, Wakefield, architect:—

Excavating, brick and stone:—			
Elvey, E. A.	£453	0	0
Slating:—			
Ryeroft, C. F.	£44	0	0
Plastering:—			
Driver, G.	£39	12	0
Carpenter and joiner:—			
Ibbotson, N.	£129	19	3
Plumbing, glazing, &c.:—			
Atkinson, S.	£120	0	0
Painting:—			
Turner, C., and Sons	£10	5	0

BIRMINGHAM.—For the erection of a villa residence in Moor Green-lane, Moseley, for Mr. J. L. Tustin. Mr. T. W. F. Newton, 121, Colmore-row, Birmingham, architect and surveyor:—

Parker	£2,145	0	0
Huins and Son	1,850	0	0
Rowbotham	1,793	0	0
Davis (accepted)	1,770	0	0
Hughes	1,718	0	0
Johnson (withdrawn)	1,690	0	0

BIRMINGHAM.—For the erection of "Pines," a summer cottage, for Mr. T. W. F. Newton, 121, Colmore-row, Birmingham, architect and surveyor:—

Huins (accepted)	£650	0	0
------------------	------	---	---

(This was only for shell, and did not include any fittings.)

BIRMINGHAM.—For the re-erection and enlargement of a farmhouse at Bangley, in Staffordshire, for Mr. A. B. Foster, Canwell Hall, Tamworth. Mr. T. W. F. Newton, 121, Colmore-row, Birmingham, architect:—

Surman, S., and Son	£1,937	0	0
Jones and Lloyd	1,797	0	0
Clarson and Son	1,793	0	0
Johnson	1,595	0	0
Trentham (accepted)	1,580	0	0

BIRMINGHAM.—For the erection of one villa residence in Clifton-road, Sutton Coldfield, for Miss Shaw. Mr. T. W. F. Newton, 121, Colmore-row, Birmingham, architect:—

Jones and Lloyd	£493	0	0
Merton and Hughes	437	0	0
Trentham	412	0	0
Johnson	395	0	0
Simons (accepted)	285	0	0

BIRMINGHAM.—For the erection of a country house at Barnt Green, near Bromsgrove, for Mr. F. Taylor. Mr. T. W. F. Newton, 121, Colmore-row, Birmingham, architect:—

Moffatt	£1,983	0	0
Tilt and Weaver	1,930	0	0
Brazier	1,770	0	0
Huins and Son	1,730	0	0
Gowing and Ingram	1,689	0	0
Marshall	1,687	0	0
Surman and Son	1,633	0	0
Hughes, M.	1,621	0	0
Webb, J.	1,597	0	0
Jones and Mason (accepted)	1,595	0	0
Read and Son (withdrawn)	1,484	0	0

Architect's price, £1,550.

BLACKPOOL.—For the terracotta work required in the erection and completion of the Blackpool Tower Buildings. Messrs. Maxwell and Tuke, 29, Princess-street, Manchester, architects:—

The Ruabon Brick and Terracotta Co., Limited	£1,572	5	4
--	--------	---	---

BRIGHTON.—For alterations to premises in Brixton-road and Tunstall-road, for Messrs. Peter and Evans. Mr. G. Warren Cooper, F.S.I., M.S.A., Bedford-row, architect:—

Saunders, E. J.	£1,050	0	0
Triggs, E. (accepted)	900	0	0

BURY.—For the erection and completion of the new Royal Hotel, Bury. Messrs. Maxwell and Tuke, 29, Princess-street, Manchester, architects:—

Newhouse and Wrigley, Bury (accepted)	£3,385	0	0
---------------------------------------	--------	---	---

DUDLEY.—For the erection of a dwelling-house, Castle View, Dudley, for Mr. E. Dunn. Messrs. John G. Wright and Son, 28, Wolverhampton-street, Dudley, architects:—

Webb and Round	£290	0	0
Colcott	273	0	0
Love and Flint (accepted)	267	10	0

All of Dudley.

DUMFRIES.—For the enlargement of the County Buildings for the County Council. Mr. D. McNaughton, Glasgow, architect:—

Accepted tenders (lowest offers in every case):—

Mason work:—			
M'Cullum, J. B., Glasgow	£3,500	0	0
Joiner work:—			
Dougall and Gibson, Dumfries	1,973	5	4
Plumber work:—			
Colville, A., Dumfries	£392	14	6
Slater work:—			
Thom, A. M., Dumfries	£109	11	1
Plaster work:—			
Mackenzie, D. and J., Glasgow	£477	9	11
Total, £8,763 9s. 10d.			

EAST HAM.—For erection of shops at Plashet-road.

Mr. F. A. Ashton, architect:—			
Cocks, J. and H.	£2,600	0	0
Shurmer, W.	2,439	0	0
Hearle and Farrow	2,465	0	0
Watson, W.	2,276	0	0
Voller, F.	1,895	0	0

ERITH.—For a new flour-mill at Erith, for Mr. S. Cannon. Mr. W. Egerton, architect and surveyor.

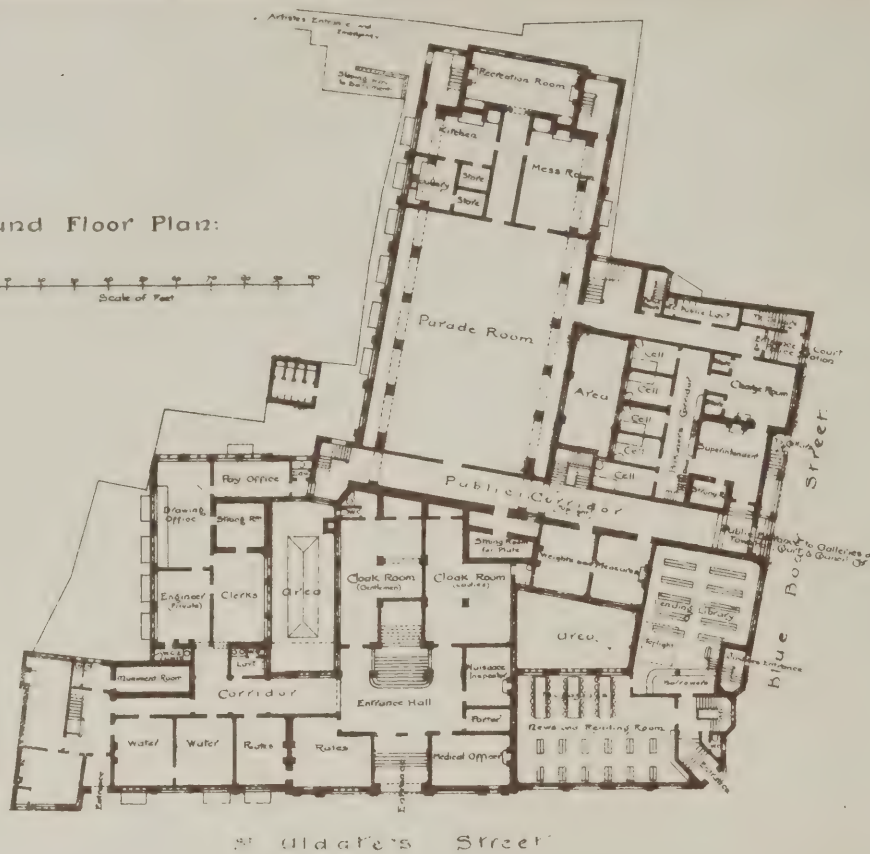

Quantities by the architect:—			
Butler, R. and J., Bexley Heath	£5,258	0	0
Miles, G., Erith	4,950	0	0
Parsons, E., and Co., Wandsworth	4,877	0	0
Boyes, T., London	4,543	0	0
Jerrard, S. J., Lewisham	4,408	0	0
Wallis, G. E., and Son, Maidstone	4,435	0	0
Kirk and Randall, Woolwich	4,242	0	0

* Accepted.

PROFESSIONAL EXCLUSIVENESS.

AMONG nearly all professions a spirit of exclusiveness prevails. Medical practitioners are probably great sinners in this respect. Their professional societies and institutions are arbitrary and exacting, and if one of their members endeavours to mark out a line of practice for himself, no matter how reasonable it may be, he is at once subjected to an inquisitorial examination, if not summarily ejected from the society of which he may have been a member, and a distinguished one. In the Bar the same exclusiveness holds in the admission and conduct of members. The art of architecture has not hitherto ranked among the "close" professions. Not so very long ago it was looked upon more as an accomplishment. Men like Inigo Jones, Wren, Sir John Vanbrugh the dramatist learned the art not as professional architects, but as amateurs. During this time we might say all the more illustrious names who have done honour to the art were amateurs. Aldrich, D.D., Dean of Christ Church, Oxford, the designer of the beautiful garden front of Corpus Christi College, Sir James Burrough, Master of Caius College, Cambridge, were both eminent amateurs of architecture, whose works, literary and architectural, attest a knowledge of the art as comprehensive and practical as that of any professor. A Lord of the Admiralty, Dr. Clarke, designed the Library of Worcester College, Oxford. Again, we can point to the Earls of Pembroke and Burlington, to Horace Walpole, the pioneer of the Gothic Revival, and the designer of Strawberry Hill; to Beckford, the architect of Fonthill Abbey, who employed James Wyatt to assist him, and to many others, to show that architecture was learned as an art, like music or painting, or any other accomplishments, by private noblemen and gentlemen. We know that men like Wyatt and Nash made names as professional architects; the former studied antiquities at Rome, whither he was taken by Lord Bagot, and also to Venice, and on the death of Sir W. Chambers was made surveyor-general and comptroller of his Majesty's office of works; Nash, according to Britton, was first a miniature painter, and afterwards turned his attention to architecture; according to others he set up as a measuring surveyor and builder. The age in which they practised was one of dilettanteism, and antiquities were more in quest than practical architecture. Those who practised building were generally surveyors; but the modern professional architect came into existence to meet a demand arising out of the requirements of contracts. The exclusive nature of his calling has been increasing from that time to this, and may be said to have been chiefly owing to the separation of building as a distinct business. Previously, architects often united the work of the builder to their own art, as there is ample evidence to prove. With the departure of the age of dilettanti, architecture became a specialised business, and this specialisation is likely to go on increasing as the requirements of buildings become more numerous and complex. We cannot wonder that professionalism has become rampant, and that the amateur element is fast dying out. Architects have banded themselves together into societies, and become organised, the profession has increased vastly in extent and efficiency, the requirements have become greater and more

complicated, and even art itself is better understood. But with these gains the spirit of monopoly and exclusiveness has grown stronger. The profession no longer suffer the amateur to have a voice, as was at one time the habit; they wrap themselves in the garments of their own exclusiveness.

Is this spirit desirable for art? We do not think it is. Interference on the part of the public in matters they are ignorant of is one thing; but intelligent opinion and artistic patronage quite another. The educated and cultured amateur has always been the friend of artists; in the revival of Art in the fifteenth century—in the age of the Medici—princes and nobles and illustrious citizens joined in patronising architects, sculptors, and painters and a whole host of artists, and their patrons were directed by a deep knowledge of classical literature and antiquities, and stimulated by a fervent love of art. We are afraid this sort of patronage has, to a large extent, died out since art has been exclusively followed by individuals who make a living by drawing commissions and percentages. In those days there was a commonwealth in art: those who were gifted were sure of patronage, for there were none of those restricting accidents which now compel the artist or worker to obtain a living by becoming a subordinate to a middleman contractor.

Genius is now fettered by organisation; even the workman, if he is to obtain a fair wage, must become a unionist or must enter a large firm, instead of finding direct patronage; and the painter or the architect, if he wants to make his talents known, must become a member of a society, or await the chances of competition. Unfortunately, it happens that organisations when they attain any position are apt to become cliquish, and to exclude men whose ability is unquestioned, especially if they happen to kick against old fogeyism and undue restraint. Have we not examples of this in every profession; and has not the same spirit of exclusion been seen at the Institute, where those who have been so fortunate as to move in the inner circles of the council are inclined to stubbornly resist any intrusion of new-comers? May we not see it, too, in the eagerness with which fellowship is being guarded; in the resistance lately made against associates by one section of "fellows" who have entered easily themselves, to shut out all others who are seeking for the same rank, and for that purpose to make an examination compulsory? Men of ability have been "black-balled" without justification, and now we have a coterie of members who are determined to narrow the entrance to the Institute by imposing a rigid test even upon those who have been in practice for many years. Thus we have a party, small relatively to the whole, who would narrow the profession to a clique; others who would widen the basis of competent membership by a legislative measure. If we look at the building trades we shall see a similar desire to exclude certain workmen who are not unionists, and those who have gone in for registration, like the plumbers, are, in a less reprehensible manner, seeking to restrict the trade. But what we distinguish is the cliquishness from the constitutional and fair mode of restriction. The former is to band together a few of the fortunate and subscribing members in some representative body or union; the latter is to permit all men to practise or to exercise their vocation who have shown their qualifications before a properly constituted tribunal.

We have thus seen what a different state of things exists now to that of the early time when architecture was an accomplishment like music or painting, and when the profession was freely constituted and freely practised. The results are before us. The buildings of the Renaissance are still models

of excellence which we copy and admire; structurally they are examples of solidity and execution, which even our improved scientific knowledge and technical training and organisation have not succeeded in surpassing. The separation between building and architecture was not so great as it now is, for craftsmanship was joined to artistic callings. In the modern building—the result of contracting—we see a conglomeration of interests: the specification writer and surveyor, whose work is to cut the trades to cost; the contractor, whose interest it is to organise and carry out these trades with a margin of profit, and, lastly, the architect or designer on paper whose efforts are completely controlled and handicapped by the former. Although the whole process of building and design is supposed to be a fully organised combination of architectural skill in which the architect is the head, it is not too much to say that it is a heterogeneous product of distinct and conflicting interests in which separate and often overlapping trades appear. We see in it, often painfully, the exclusiveness and specialisation of which we have been speaking, from the architect downwards. His design on paper has been followed only so far as it can be understood by the contractor, and then only by the light of the contract. Return mouldings and depth, and details not shown clearly are very scrupulously neglected; the quantities have been literally construed without reference to the meaning of the specification, the bricklayer has so mechanically kept to his instructions that he has not given a thought of the requirements of the mason, and the carpenter and joiner and plasterer have each worked at variance with one another, and, in the subsequent trades of fitting up specialities, we detect the same lack of co-operation and unity of purpose between them. We can, so to speak, trace the handiwork of each tradesman who has done his work strictly according to order. No room is allowed for suggestion or discretion, every item is cut and dried, and the "give and take" principle which worked so admirably under the older régime of "measure and value" during ante-contracting days is no longer rendered possible. The narrow, exclusive tendency still continues; each profession and trade is cut up into separate branches which become more and more estranged from each other, much to the advantage of contracts, but to the detriment of architecture.

LONDON BUILDING LAW.

THE suggestions proposed by the Council of the Society of Architects in relation to the London Building Law (Consolidation) Bill, and which at the last meeting were recommended to be submitted to the Local Government Board, are desirable, if rather indefinite and incomplete. We lately noticed some of the suggestions made by the Building Act Committee of the London County Council. We generally expressed our approval of the regulations to insure the minimum strength of flooring joists, access to roof in case of fire, the stability of factory chimney shafts, increased height of habitable rooms, direct ventilation by means of windows for rooms and by skylights and other modes for staircases, and chiefly of the proposal to adopt a rule for regulating open spaces at the rear of buildings. Many other suggested amendments have been made to the Bill by the District Surveyors' Association, the Institute of British Architects, and other bodies.

Referring now more particularly to the report of the Society of Architects, we find the suggestions are ranged under two heads, the "general," and the "particular." Under the former it is proposed that hard and fast rules should be made in preference to optional

rules at the discretion of district surveyors or the County Council. We have always argued that "optional" or "discretionary" powers were somewhat dangerous, as they induced builders and the public to rely too much on the favour and feelings of the board of council. We have seen at least how imperfectly the optional plan of deciding building questions has worked, as, for instance, in the cases of general building lines and height, where very objectionable precedents have been set, which have encouraged speculative builders to expect a great deal more than can in justice to public rights be granted them. That regulations should not necessitate cost in construction may be taken from different points of view. The "jerry" builder would object to every necessary requirement as costly—a concrete layer for site, damp-courses, thick party and other walls, adequate scantlings would be all voted by him as unnecessary and costly, so that the recommendation, however good in theory, would be variously interpreted. With regard to the particular suggestions. As to openings in external walls, the present rule that the "area of such recesses and openings" should not, taken together, exceed *one-half* of the whole area of the wall, is certainly rather restrictive, as recesses as well as openings are taken together in the measurement. The word "recesses" should have been included in the suggested amendment, as it is material. If voids only were intended, as appears in the Society's report, one-half of the area would be tolerable; but when "recesses and openings" are taken together the area is insufficient, and *two-thirds*, as suggested, would not be too much. A schedule of minimum scantlings for joists, girders, beams, columns, and piers would be of undoubted advantage, and would save much of the surveyor's time and trouble; so, too, the suggestion that the party-walls of the warehouse class of buildings should be carried up to 3ft. above the roof may be accepted. Clause 6 of the Consolidation Bill, or 18 and 19 Vic. c. 122 gives only 15in. for height of party-wall above the roof-flat or gutter of the highest adjoining building without any reference to the class of building. The London County Council has suggested that in a building of the warehouse class this height should be at least 2ft. Certainly this is little enough, and 3ft. (measured at right angles, we presume, is intended) is not too much, as any fire-brigade man would say. The sections suggested for dealing with the lighting and ventilating of staircases and habitable rooms are very necessary, and the London County Council have already proposed windows and skylights under clause 12 and 12a. The tailing down of cornices and balconies is one matter deserving attention, which we are glad to see proposed, and it is extraordinary that no provision is made for the structural security of these features which have so often failed with disastrous consequences. The London County Council have strangely passed over this point, and have left it for others to propose.

The projection of oriel windows and turrets is an architectural question that has been raised. No doubt there should be some license given to permit features of this sort under certain regulations if we are to save our new streets from dull monotony. The L.C.C. amendments suggest that in a street of not less than 40ft. in width oriel windows or turrets may be constructed, provided that they do not project more than 3ft. from the front face of wall, or more than 12in. over the public way, and at a certain height above level of footway, and at a distance of 4ft. of the centre of nearest party-wall. It also restricts the width of such feature to one-third the length of the wall. These rules appear to be reasonable, though the distance from party-wall is somewhat unfortunate for architectural effect. It is

proposed by the Society that buildings used for dwellings and for purposes of trade should have the two portions divided by fire-resisting floors and inclosing walls, staircases, and doors. No one can find fault with this separation in the case of buildings used for dwelling and storage—a common occurrence in the metropolis and in all large towns. The L.C.C. have on this point also wisely suggested that all public staircases in churches and chapels, &c., should have inclosing walls of brick, and at least 9in. thick; that corridors and passages for public use shall not be less than 4ft. 6in. wide, and be increased if they communicate with any portion intended to accommodate more than 400 persons by 6in. for every additional hundred. Constructional iron-work it is proposed should be compulsorily incased in fire-resisting materials. We have some doubt whether this rule is absolutely necessary in some buildings, and it would be hard to define what a "fireproof" building should be. For the lower flanges of girders, iron roofs, and columns such incasement would be desirable if there was great risk or inflammable storage.

We cannot endorse the suggestion that the method of regulating the area at the rear of buildings proposed by the L.C.C. would reduce unnecessarily the building capacity of sites where land is valuable. No doubt the area, by the means proposed of allowing an open space of 20ft. between buildings in the rear, and regulating the height of the buildings in the remaining portion of the land by a line drawn at an angle of 45° from the street-level, will be greater than has been allowed in many cases, but certainly not more than is necessary to insure a sanitary result and the prevention of the existing overcrowding. If we are to insure the advantages of a sanitary building law, some slight sacrifice of space is absolutely necessary. We have described the method of regulating the open space at the rear of dwelling houses proposed, and we must say that in spite of some objections to the method in the case of irregular boundaries and corner sites, the plan is less open to objection than others that have been proposed. An open space of not less than 150sq.ft. in the rear of each domestic building is by no means excessive where closets and conveniences are permitted of a certain height (9ft.) The limiting angle of 45° will permit light to the rear of buildings built back to back, a condition which is not now attained on many crowded estates.

We quite agree with the proposals that adjoining owners should be protected against loss by alterations made to party-walls by the building owner for his own advantage, and that small erections such as greenhouses should be exempted from vexatious regulations. At the same time, it is to be hoped that something will be done to stop the intolerable nuisance of the rubbish-burning hot-house, with its low chimney defiling the gardens near. It is a pity the report was not drawn up with more detail, and the council's opinions expressed more fully on some of the above questions, as well as upon others, such as the maximum height of new buildings, height of habitable rooms, the rebuilding of premises burnt or pulled down, the width and construction of public staircases, passages, and doorways, and the definitions of terms used in the Act.

THE "ORDINARY FLOW" OF A RIVER.

OF the several useful purposes of a river, as distinguished from those of beauty and pleasure, the chief one is the outlet it affords all along its course for the drainage of the land at the lowest possible level; but, besides this, if any considerable population have gathered near its head for mining or mercantile purposes, its water affords power

at little expense for mills, and these often supply the wants of a large neighbourhood. Lower down, after tributary streams have joined it, its usefulness for mill purposes becomes less by reason of its decreased rate of fall, while at the same time its volume is increased, so that, with greater outlay, larger mills are established, and lower down still the fall is so much reduced, and the volume and dimensions of the channel so much increased, that the river is used as a waterway for merchandise. In all parts of a river except the highest, its condition in respect of its height and depth of water is the subject of observation from day to day almost. The height of the water at its summer level is marked by vegetation on the piers and abutments of bridges, and the stumps of trees on its banks. This level is that at which the water runs for the longest periods of time. It is most perceptible in summer; but is often seen at other times of the year also where floods have not destroyed the marks. The level of the ordinary flow, however, is not defined by any such marks. It is known pretty well to those who live near the river, or who are in any way particularly interested in its condition at all times of the year, as, for instance, those who make observations for the purposes of water supply to towns, or for its use as power; but it is not defined: there is no ordinary-flow mark, as there is for both lower and higher states of the river. The dry-weather flow, or summer level, is better known, because a river in that condition attracts more attention, and every bare stone or other mark upon the bank is noticed by a hundred eyes—perhaps not every year, but often for several years together; and the general consent as to what is the summer water level seldom varies many inches above or below a level which may be taken as a standard for any part of the river. This is a level somewhat above that to which the water falls occasionally after long droughts when the river runs at its minimum flow. The minimum flow in some years never takes place, and in none does it continue for any length of time, and its level is as much undefined as that of the ordinary flow. In the other direction, that of floods, the highest flood-marks are usually pretty well defined also. Between the two is the height of the ordinary flow. It is hardly worth while to multiply or to require defined conditions of a river further than these three, except that it is necessary for some purposes to know the absolute minimum; for although it may not occur even once in a year, or but seldom, and never for any length of time together, yet it is very desirable to know what it is.

But it is the ordinary flow which governs the chief commercial and other relations of a river. The case is similar to that of the gradients of a railway: a short, steep incline may be surmounted by the locomotive engine, exerted at its full power for a short time beyond its ordinary working power, but the long inclines of lesser gradient, or a succession of short ones, govern the loads which can be taken; and a mill using a stream of water for power is, or should be, proportioned in its motive power to the ordinary flow of the stream.

When we inquire into the water power of streams in general, we find a great want of such observations as would define, with even approximate accuracy, their power for useful purposes; or at least for doing useful work.

In different rivers the ordinary flow bears a different relation to the dry-weather flow and the minimum flow, according to the ground from which the water comes. In some rivers its volume is not much more than twice the dry-weather flow, and is not much higher in level, while in other rivers the level varies so much in a short time that it is almost impossible to say from observation what really is the height of the ordinary flow. Water coming from absorbent rocks, such as chalk,

the oolites, the mountain limestone, and great thicknesses of the millstone grit formation, comes down more regularly throughout the year, and establishes for itself a perennial flow which is both well marked and highly appreciated, especially by millers; while from the non-absorbent rocks, clays, and lias beds the streams descend more suddenly and make it difficult to establish any quantity which can be called the ordinary flow; and yet there is such a thing in these rivers as well as in others, it being that quantity which can be made most use of, excluding alike excessive floods and very low states of the river; but it requires for its determination a greater number of observations in some rivers than in others. Mr. James Leslie proposed, in a paper read at the Institution of Civil Engineers, to divide the annual flow of a river in this wise—First, to set down the whole number of gaugings in the order of their quantities and divide them into four parts, equal in number, the lowest fourth part being the dry-weather flow and the highest fourth part the floods; the average of the middle half then to be ascertained, and all above that average to be rejected as flood water; then a new average to be ascertained by first taking the actual quantities of all the gaugings which do not exceed the first average, and reducing to this average all quantities which exceed it, and then to take the mean of all these as the average volume of the stream. This, however, would seem to be hardly an average, for the average includes all floods, both great and small, and the great ones are of no sort of use in the economy of the river, although the smaller floods are useful as flushes, and in general a flood does no harm until it approaches to the condition of bankfull. In this condition the banks suffer damage by the earth being washed away, allowing the brink to fall into the water, decreasing its depth temporarily, and eventually raising the bed and increasing the height of all floods until one occurs which is strong enough to clear away the deposit by scour, which seldom happens.

The proportion of flood water to the average flow of a river is greater where the watershed area is of an impermeable character, as clay, than where it is absorbent, as sandstone or chalk. In a district consisting mostly of impermeable ground—more or less so—the floods rise rapidly and fall quickly, while in districts of the other kind of ground they run off at a more even rate during a longer time, the rainfall producing the flood being the same in both cases. The watershed area of the river Medlock, which falls into the Irwell below Manchester, is approximately 12,000 acres in extent, mostly clay, and one of the floods which occurred here ran at the rate of 10c.ft. per minute per acre of that area; another one 12·6c.ft., and another 15·1c.ft. per minute per acre. But these are but moderate floods in their rate of flow from such ground. As much as 30 has been measured.

In the Woodhead district of the Manchester Waterworks, a flood occurred which was measured at 17·3c.ft. per minute per acre of the watershed area of 7,000 acres of moorland, the ground being mostly of sandstone and shale. A flood which occurred at the site of the Bilberry reservoir, near Holmfirth, amounted to 16·3c.ft. per minute per acre of the watershed area of 15,400 acres, chiefly of the millstone grit formation, while the average flow at the same place was at the rate of 6c.ft. per minute per acre. In this case the proportion was $2\frac{3}{4}$ to 1, showing the ground to be, for the most part, of an absorbent nature.

Springs sometimes contribute a large quantity of water to the ordinary flow of a river, and none more remarkably than at the upper sources of the Thames in Gloucestershire. The Boxwell spring, at South Cerney, and the Ewen spring, near Ciren-

cester, each yield a million gallons a day. Ampney spring, at Ampney Crucis, two miles east of Cirencester, "an enormous quantity," according to evidence given before the former Water-Supply Commission for the Metropolis, Bibury spring rather more than that at Ampney Crucis; another spring more than two million gallons a day, and another a million and a half gallons. These three are on the Colne, a tributary of the Thames.

All these springs are at an elevation of from 300ft. to 380ft. above the sea, and all contribute to the ordinary flow of the River Thames at one point or another. At the sitting of the commission before named, Mr. Hawksley put in evidence a diagram showing that when a flood rose at Ditton (to come down from the upper portion of the Thames to the lower) to 7,000 million gallons a day, the quantity reduced to 6,000 in 1 day; to 5,000 in 3 days; to 4,000 in 5 days; to 3,000 in 8 days; to 2,000 in 12 days, and to 1,000 million gallons a day in 30 days, after which the reduction in the quantity was at a much less rate, the flood-water having mostly passed off; and, providing that the rain did not continue, the quantity became less by about 31 million gallons for each succeeding period of 30 days, until the minimum of 350 million gallons per day was reached 240 days after the occurrence of the flood of 7,000 million gallons, providing no rain had occurred in the mean time. Another diagram showed the average daily rainfall over the Thames basin during each month from January, 1855, to 1866, and the volume of water discharged each day at Thames Ditton during the same period; from which it is seen that 1,000 million gallons is considerably more than the ordinary flow in almost every one of those years, and probably the ordinary flow would be not more than from 700 to 800 million gallons a day. The way in which the annual average flow of the Thames is stated by Mr. Hawksley is that from 1855 to 1866 two-thirds of the rainfall was evaporated, and one-third was discharged by the river, half of this passing off in floods, the other half being the flow of the springs from the permeable ground of the river basin, which amounts to two-thirds of the whole watershed area above the point of observation. When put in the way of percentages, these proportions are, that 66 per cent. of the rainfall is evaporated, 17 per cent. pass off in floods, and 17 per cent. come from springs. The area of the Thames watershed above the point of observation at Ditton is 3,676 square miles, or 2,352,600 acres. At a meeting of the Institution of Civil Engineers in 1876 Mr. John Taylor, the engineer to the Lambeth Waterworks Company, stated the whole quantity of water which had passed down the river at a point opposite to the intake of the Waterworks at Ditton between the years 1853 and 1875—23 years. Mr. J. T. Harrison gave evidence before the Rivers Commission in 1867 that from the same records during the 11 years 1855 to 1866 the quantity passing down the river was such that it represented an annual average depth over the whole watershed area of 9·4in., and that, as the average annual rainfall during those years was 27·4in., it showed that 18·4in. of this had been evaporated, the difference, 9·4in., being the quantity going down the river. It hardly follows, however, that the whole of the difference of 18·4in. was evaporated. That would be considerably more than the average amount of evaporation in England, which is nearer 14in. Considering the extensive beds of gravel in the Thames Valley below the point of these observations, it is more likely that as much as 3in. or 4in. in depth of the rainfall finds its way underground, and comes to the surface somewhere in the tide-way above or below London.

The average quantity of water passing down the Thames at Ditton during those

eleven years named was 1,350,000,000 gallons a day. The dry-weather flow was 360,000,000. The ordinary flow was about a mean between these two quantities.

THEATRES.

By ERNEST A. E. WOODROW, A.R.I.B.A.

THE question of how best to plan and construct a theatre is a hard one to answer. Within the past few years some writers and many lecturers have laid before the architectural profession and the public, their own and other people's ideas on the subject. Scarcely a paper has been written but some good point can be gathered from it; yet many articles have appeared putting forth theories which have originated in the fertile mind of the author, who displayed a total lack of knowledge of the requirements of a theatre as a place wherein to carry on the business of theatrical entertainment, otherwise such ideas could never have entered his brain. On the other hand, the very small section of the architectural profession who make theatre-building a speciality, has proved by the works actually carried out how theatre planning and theatre construction have made rapid strides of improvement within recent years.

It fell to my lot during the past session of the Architectural Association to read a short paper upon the subject of recent development in theatre planning. I was exceedingly fortunate on that occasion in being able to exhibit, through the kindness of the London architects whose practice lies in theatre work, a collection of theatre plans, such as, I believe, have never been collected together before. Those readers of the BUILDING NEWS who saw those plans will readily endorse my views that theatre planning and construction have made greater progress than that of any other class of building.

In the paper to which I have referred I was unable, on account of the enforced limit necessary, to do justice to my subject, and although, through the invitation of the Editor of the BUILDING NEWS, I have now the opportunity of dealing more fully with the question, yet I cannot hope to comment upon all the points that should be observed when building a place of public entertainment of this character.

Sir E. M. Shaw, in the preface to his second edition of that useful work entitled "Fires in Theatres," says that of all buildings theatres are the most dangerous. People often wonder why theatres are so frequently unfit for the purposes for which they are used. There appear many reasons why the unsafe theatre has arisen—first and foremost, because the majority of architects (with the exception of the specialists who have built theatres) know little or nothing about the requirements of such a building; there is no building requiring more technical knowledge than a theatre, and no building surrounded with such risks from fire. To successfully plan a playhouse, it is necessary to have an intimate knowledge of the whole of the workings of the theatrical business, and as we pass from point to point and from room to room, in these articles, we shall see what a host of detail has to be considered before putting the pencil and T-square on to the drawing-board. Ignorance in the requirements of the plan is one reason why dangerous theatres have been built. Poverty, stinginess, greediness on the part of the manager, and an anxiety to make money, even at the risk of human lives, are other reasons. For example, using materials unfit for the construction of theatres, converting buildings never intended for such a purpose into theatres, and erecting them upon sites unfit to receive them.

It will be remembered that the Gateshead Theatre, which was the only place of public resort in the town, was originally "an ill-built Methodist chapel." The structure was then converted into a music-hall, and finally into a theatre. The unfitness for such a purpose was illustrated by the terrible disaster. It is from such practical lessons as these that the would-be theatrical architect must learn.

Signor Daniele Donghi, an architect of Turin, in a somewhat lengthy pamphlet treating of the safety of theatres in the case of fire, remarks that architects should bear in mind the grave responsibility under which they rest with regard to the construction of a theatre; they should not allow themselves to become the slaves of a theory or of the purse of a parsimonious client, and should not undertake a work if they cannot carry it out

without giving occasion to catastrophe; they should think of their present and future shame, and the crime they would commit in building a defective theatre.

No architect in England can build a theatre without complying with the requirements of the local governing authority, and should he not be thoroughly conversant with theatrical matters, he will find great difficulty in producing a plan which will at one and the same time meet with his client's conditions and the approval of the local authority which has the responsibility of the safety of the public vested in it by Act of Parliament. Architects, therefore, who have theatres to build are more or less encumbered by these difficulties, and my contention is, that unless an architect has a special training in planning such places of public entertainment, he will be surrounded with such difficulties that at times despair will almost overtake him. We live in an age of specialists; we live too fast to permit of time to reflect upon details—they must be at our fingers' ends. The client's time is the client's money, and unless an architect can show that his knowledge will allow him to prepare his plans, and have them approved with despatch, he will be left behind in the rapid race of the age, and it is, therefore, no wonder that the public place special work in the hands of special men; modern requirements demand it.

To obtain the knowledge necessary to make a successful and satisfactory plan, it is needful to acquire an insight into the mysterious workings of the theatre in all its departments. "Commence," it has been said, "in the manager's room if you desire to become a good theatrical architect," and with this I agree. Few, however, can obtain admission to the sacred precincts of the manager's room, or, when there, be admitted into the mysteries of theatrical management. When they have, there is a still greater mystery awaiting them as they descend from the well-appointed office to the vast expanse and seeming confusion of the stage and its machinery. Until an architect has mastered these details it is useless for him to try and build a theatre, for he is sure to meet with failure. He may design a beautiful building as perfectly as possible as far as sound, sight, and safety are concerned, and yet fall far short of perfection from a manager's point of view. Some houses have proved failures because they have been too expensive to work, have required too many attendants, money-takers, and check-takers, and have not held enough "money" to pay the weekly salary list. The auditorium may prove to be too large, or not large enough, for the particular work of the house, a few seats more or less make all the difference in the year's treasury, and may mean failure or success to the manager. The same remarks apply to almost all details of the building. Now these are faults which arise through the lack of experience on the part of the architect.

It is impossible to draw up a hard-and-fast set of rules applicable to all theatres and places of public entertainment; otherwise my present task would be a comparatively light one. Each individual case must be governed by the particular requirements of the class of performance to be given, the class of audience to be entertained, the money to be spent, and the site at the disposal of the client. Unless there is sufficient money and a good site the architect had better not attempt to build. A cheap building is sure to be a bad one—and, of all buildings, theatres should be constructed well, with the very best possible materials suited for the purpose; for until a perfectly fireproof building is produced one cannot assure the public of their safety.

The recent lengthy inquiry of the Select Parliamentary Committee on theatres and music-halls, under the chairmanship of Mr. Plunket, is fresh in the memory of most of us who take any interest in theatrical matters. It is no part of these articles to dwell upon the arguments brought forward by the witnesses and experts examined before this committee, although I may be able to strengthen some of my remarks by reference to important evidence of a purely technical character given by some. We have nothing to do here with questions of licenses, or of what body should be the supreme authority over matters structural or moral. The object of these papers is rather as a series of notes collected for the help of architects who have not, but may have, theatres to build. Far be it from me to dictate or make suggestions to those architects who have distinguished themselves in this complicated branch of the profession; but rather do I hope to help others by

gleaning from the information that has in one form or another been laid before the public. The majority of this information is scattered about in the form of lectures, newspaper articles, and public letters; the works on theatrical architecture are few and far between. Some of the greatest help can, I contend, be obtained by a judicious study of the rules and regulations enforced at home and abroad, and it appears to me that it will be a wise course to pursue if I make full references to these, as we consider the requirements of a theatre.

So far as the public are concerned, there are many people who would far rather not know of the danger that surrounds them, and whose natural nervousness alone would create a feeling of panic; but it has been rightly said that such nervousness is caused by a knowledge wholly senseless and worthless—it can never by any possibility do good, and may do harm. These are the views of the greatest authority in such matters, Sir Eyre M. Shaw. The architect must be fully alive to all the dangers, and, armed with a knowledge of them, he must seek means to overcome them. It is only by studying the cause of the accidents which have happened that we can hope to find the remedy. I believe in practical lessons from actual events, more than the theoretical lessons delivered from the lecture platform.

The conservative character of the theatrical manager is well known, and the architect who is desirous of introducing reforms and improvements in the arrangement or construction of theatres must be warned against disappointment, for in many cases he will meet with little encouragement; but, for all that, there are managers who have shown a desire to advance with the times, and although it is perhaps somewhat invidious to refer to names and buildings in articles of this character, one cannot help reminding one's readers of the marvellous advancement in constructive detail shown in Mr. D'Oyly Carte's Royal English Opera House, and in the theatres erected in the West End by Mr. Phipps and Mr. Emden.

Speaking of the advancement in the safety of the structures of the London theatres, the Select Committee reported to the House that the credit of this was no doubt mainly due to the zealous efforts, first, of the Metropolitan Board of Works, and afterwards of the London County Council, working through the Theatres Committee. There is more truth in this than at first meets the eye, for it is certain that the improvement in the construction of theatres has arisen since the passing of the Metropolitan Management and Building Acts Amendment Act in 1878, which gave the Metropolitan Board and the London County Council their powers over the construction of theatres.

Before commencing to dwell upon the details of the question, I have one or two general remarks to make. The safety and comfort of the audience must be observed in designing a theatre. A house must be provided in which the performance can be seen and heard from every seat, whether it be a sixpenny gallery or a guinea stall; the auditorium must be designed so that every member of the audience can speedily obtain access to the street, and materials of fireproof nature must be used to form a building in which the public can feel secure.

The provisions for the comfort and safety of the performers until late years have been but small. There, however, now appears to be more public demand for the better protection of the artists who are the exponents of one of the highest arts.

The key-notes for perfect planning in theatres are simplicity, compactness, uniformity, and order, having due regard for economy of space, yet providing a place for everything and ample room for everybody.

Panic is so closely associated with theatres that making provisions to lessen the chances of its awful consequences is obviously one of the greatest aims the architect must have in view. No man can plan a building in which it is absolutely certain no danger will arise from panic. A stampede can take place in the open air. It cannot be eradicated by the number of exits, the width of the staircases, the pattern of the door fastenings, the number of fire-buckets, or the fireproof construction of the building. The only certain means of absolutely preventing panic would be to educate each individual member of the audience to maintain self-control; but where the audience know that they are well protected, where they

know the position of the exits, that the building is fireproof, that the management is a good one, that the fire watch is well organised, the chances of panic are lessened, and people will be less nervous, less likely to jump up at the least sound or cry out at the sight of a slight accident.

I mentioned "management," and maintain that good "management" in a theatre can do even more than the architect, and a bad "management" can, and sometimes does, destroy many of the provisions the architect has made for the public safety. When I speak of good management, I mean where the acting manager sees personally to all such details as the competency of the fire-watch, the efficiency of the fire-extinguishing appliances; where he does not allow overcrowding in the auditorium, the obstruction of passages or gangways, or the fastening of doors during the performance; where he prohibits the keeping of large stocks of scenery on the premises, or the placing of things and materials in other places than those purposely provided for them; where he personally examines daily, and every evening before and after the performance, every nook and corner of the house. Bad management is the reverse of this. A perfectly-built theatre can become a death trap from the effects of an escaping gas-pipe, a locked door, a loose pay-box, a dummy fire-watch, an obstructed passage-way. Badly-built theatres can be made to a certain degree satisfactory with good management, but can never be made safe from fire. An architect may leave a good building, and the management so abuse it as to render it practically unsafe; but architects, when they build, naturally expect the building to be properly managed.

(All Prices Include Profit.)

IRONMONGER (continued).

LOCKS, including fixing—

6in. 2-bolt rim lock, with Wilkes', brass furniture, complete	each	£	s.	d.
Ditto better quality, brass bolts, and scotch spring	ditto	0	3	6
Ditto brass bushed and heavy	ditto	0	4	0
Ditto with cast brass knobs to handles and patent spindle	ditto	0	4	9
Ditto with 7in. furniture, of same quality as last	ditto	0	5	0
Ditto narrow case rim lock, brass bolts, no furniture	ditto	0	3	6
Ditto stamped steel case, no furniture, brass bolts	ditto	0	3	9
Ditto cast case, rim lock, Elizabethan design, no furniture, brass bolts	ditto	0	3	6
Ditto best quality, 6in., no furniture	ditto	0	3	6
Ditto ditto 7in. ditto	ditto	0	4	0
Ditto ditto 8in. ditto	ditto	0	5	0
Ditto 2-lever, no furniture, with two nickelled keys	ditto	0	4	0

For patent locks of all kinds—Bramah, Chubb, Hobbs, Tucker and Reeves, &c.—see further on.

5in. brass rim locks, Gothic pattern	each	0	8	0
6 ditto ditto	ditto	0	8	9
6 ditto plain	ditto	0	7	6
6 ditto ditto	ditto	0	8	0
4in. dead locks, wrought-iron bolts	ditto	0	2	6
5 ditto ditto	ditto	0	2	9
6 ditto ditto	ditto	0	3	0
4 ditto brass bushed	ditto	0	2	9
5 ditto ditto	ditto	0	3	0
6 ditto ditto	ditto	0	3	4
4 ditto ditto and with brass bolts	ditto	0	3	0
5 ditto ditto ditto	ditto	0	3	3
6 ditto ditto ditto	ditto	0	3	8
6 ditto stamped steel case, and extra wide and strong bolt	ditto	0	3	10
6 ditto with extra strong cases	ditto	0	4	0
7 ditto ditto	ditto	0	4	9
8 ditto ditto	ditto	0	5	9
6in. 4-lever, with brass bolts and patent stop	ditto	0	9	0
7in. draw-back lock, fine ward, open plate, one bolt	ditto	0	3	6
8 ditto ditto	ditto	0	3	9
9 ditto ditto	ditto	0	4	6
7 ditto medium quality	ditto	0	4	0
8 ditto ditto	ditto	0	4	3
9 ditto ditto	ditto	0	4	9
7 ditto brass bushed and strong	ditto	0	4	6
8 ditto ditto ditto	ditto	0	4	10
9 ditto ditto ditto	ditto	0	5	9
7 ditto with 2 bolts, well made	ditto	0	6	0
8 ditto ditto	ditto	0	7	0
9 ditto ditto	ditto	0	8	8
10 ditto ditto	ditto	0	10	0
7in. stock lock, common quality	ditto	0	2	9
8 ditto ditto	ditto	0	2	11
9 ditto ditto	ditto	0	3	2

THE CONSTRUCTION AND INTERIOR
ARRANGEMENT OF THEATRES.*

TEN years ago I read a communication before the Institute "On the Prevention of Fires in Theatres," which was generally applicable to the theatres of our country. I have been called upon by your Committee on Meetings to say a few words on the same subject to-night, but more specifically in regard to local conditions. My remarks of ten years ago appeared in the *Journal*, and the matter seemed of such importance to the Institute that a special committee, with myself as chairman, was appointed to investigate and suggest better features in our American theatres. Although not as much good as we had anticipated resulted from our labours (embodied in a printed report), we at least had the satisfaction of knowing that many of our suggestions were adopted in the ratings and schedules of underwriters; some, which had been deemed as impracticable by stage carpenters, have been introduced, and are now regularly in use in a number of places of amusement. It is difficult to achieve progress of any kind where a decided material return is not in view for the money expended. Allow me to rapidly make a few suggestions which are no longer novel, recapitulating much that I have said on former occasions, before proceeding to what is new and of local importance. A theatre should consist of four separate and distinct buildings, like the Park Theatre, separated by substantial brick walls

* By C. JOHN HEXAMER. Read at a recent meeting of the Franklin Institute, Philadelphia, U.S.A.

rising above the roofs, all communications to be cut off by the best known fire-resisting means. [The Park Theatre is, however, not a fireproof structure, although in its general plan the most rationally designed of all our Philadelphia play-houses, and should it at any time burn down, do not accuse me of the statement that it was fireproof!] 1. There should be a fireproof auditorium (as fireproof office buildings are now constructed). 2. A stage building. 3. A fireproof building for dressing-rooms, &c. 4. A fireproof storage room for scenery, properties, &c., with fireproof doors. The proscenium wall should rise well above the roofs of all the buildings, with an iron girder covered by a good non-conductor, relieved by an arch, the weight of the wall above being sustained by the arch, so that if the girder gives way, by exposure to the intense heat of the fire, the wall will remain in place. Designers and managers usually prefer to close off the stage opening, square at the top. Where this is not desired the girder should be dispensed with. The wall should cut the stage-floor with incombustible material. When several years ago the Academy of Music was improved, I again made this suggestion (this had previously been decried as an absurdity and practical impossibility), which was carried out, and has been in use since without annoyance or inconvenience of any kind. The wooden stage floor was cut, the wall being "brought up" near the level of the stage floor, and was finished off on the top with a heavy coat of cement which, when dry, corresponded in colour with the wooden floor, and it is not noticeable from the auditorium. Instead of being disagreeable to dancers, I was informed by the late Mr. Higbee that the *premieres* selected the smooth, hard cement pavement for their *tour de force*. It is self-evident that where the wooden stage-floor is unbroken by an incombustible barrier, fires will be transmitted beneath the fire curtain from the stage to the auditorium. The curtain should be of real asbestos, not half-cotton, with an interior network of strong, woven, pliable wire to give it tensile strength, and should slide in iron grooves, at least 6 in. deep on both sides of the stage, securely bolted into the masonry of the proscenium wall. All of the four buildings should be provided with large, separate exits to the open air. Every part of the auditorium should have separate exits, and the exit of one part should never be allowed to discharge into that of another. All corridors should increase in width from the theatre to the open air. All extra exits (fire corridors) should be marked as such in large, bold letters; should be lighted by oil-lamps (not petroleum products; sperm or lard oil is recommended), and should be unbarred from the opening of the theatre until it is closed. Before the close of every performance they should be opened, so that the exits may become known to the public. All doors should open outwards (a precaution which is still neglected in some of our concert club-halls). Long rows of seats should not be permitted. Rows should be cut by aisles at short intervals. Movable seats should not be allowed. Seats should be tightly screwed to the floor. Fixed chairs with a spring attachment, which throws back the seats when not occupied, are strongly recommended. No scenery, property, materials, or impediments or any description should be allowed to remain in the corridors. The fire-proof drop-curtain should be kept down at all times except during rehearsals and performances; after which it should be immediately let down, and not raised until a few minutes before the beginning of the next performance. The lowering apparatus should be so arranged that the curtain will be lowered automatically in case of fire. Doors in fire-walls should have stone sills, and should be fire-lined on both sides, constructed according to the underwriters' specifications, without springs or locks, so they can readily be opened. Incandescent electric lights should be used throughout, and all others should be prohibited on the stage. The system of lighting the stage should be separated from that of lighting the auditorium—each should have a distinct circuit. The system should be installed under the direction of the electric-light inspector of the Fire Underwriters' Association. An ordinance should prohibit the use of lights until so approved and the certificate of approval has been issued, and a fine of 1,000dols. for each offence should be imposed. Should managers be satisfied in placing electric lights like gas-lights, and leaving them in place

as they usually do the latter, there would be little danger from incandescent lights which have been inspected and passed; but electric lights are so easily moved, and the novel scenic effects which can be contrived with them are so tempting, that these are frequently rearranged, and this practice becomes exceedingly dangerous when carried on by ignorant persons, therefore expert supervision is most necessary. It seems clearly established that the recent Central Theatre fire was caused by a gas-light, which would have been impossible had electric incandescent lights been used exclusively. It may not be uninteresting to quote here what we advocated ten years ago:—"The greatest number of fires are caused by the paraphernalia of illumination. The danger of coal oil, which is much used in our country and Western theatres as an illuminating agent, is self-evident, but the hazards of gas, which until within a few years was the safest material at our command, are not so well understood. Besides the dangers of leakage and explosions, we have, in the case of illumination, hundreds of flames spread throughout a building, each forming a dangerous sphere around itself. Although the last-named dangers can and should be lessened by proper precautions, such as wire baskets and shields over the flames, still, when we consider the close proximity of the border lights to combustible gauzes and canvas, and ponder on the hazards of temporary illuminating effects, where jets are fed through rubber hose which must be removed during change of scene, we must ask is there no other method of illuminating by which equally good artistic effects may be produced, and which at the same time will lessen or entirely do away with the hazards of the present system? Fortunately means are now at hand. By the labour of eminent electricians, we have at our disposal an agent by which the same, if not more brilliant, effects than with gas can be produced, while doing away with the dangers of gas, the lamps themselves being absolutely safe, &c. Where electricity is generated in the theatres, the boilers, engine, and dynamo should not be located in the stage building, and lights in stairways should receive their currents from outside independent sources. A large reservoir, the bottom at least 10ft. above the highest sprinkler, holding at least 5,000 gallons, should be introduced. It should always be kept full of water, connecting with the standpipes, and not allowed to freeze. (This can easily be accomplished by passing the exhaust steam-pipe through it.) Every theatre should be supplied with a sufficient number of fire-hydrants, connected with the tank, with hose and nozzle attached ready for instant use and not removable. The tank connection is important, as the city water pressure is so feeble in some districts (having been found by actual tests to be as low as 20lb. and 26lb.), that it would be impossible to squirt to the top of the stage with the appliances now in use in some play-houses. The stage and workshops, and if there is an attic above the auditorium, this also, should be fully equipped with an approved system of automatic sprinklers, connected with two supplies, an approved pump and tank, both of which should be located outside of the stage building. Automatic apparatus is worthless unless in perfect working order, and should, therefore, frequently be carefully inspected, tested, and reported upon. The following underwriters' report on the sprinkler system of one of our theatres will give you an idea how this should be done; also of the necessity of laws, official municipal inspections, and fines for neglect in these matters. [I withhold the name of the theatre.] "*System; Wet Pipe; Equipment.*—Full protection under roof, gridiron, fly galleries, and stage. *Water Supply.*—4,000-gallon tank on roof. Bottom of tank is elevated 10ft. above highest sprinklers. Tank is filled by steam pump, and has steam pipe inside. *Condition of Equipment.*—Fair. Rising main is 3in. Pipe sizes are correct. Check valve at tank to operate automatic alarm, which is located on stage and in good order. Pet cocks in upper part of system. No city water or pump connections for supply. No hose attached to sprinkler system. Draw-off pipe approved. *Remarks.*—The water in tank has been repeatedly found low and frozen, and it is evident that proper attention is not given to the sprinkler system. We, therefore, rescind the sprinkler allowance until further notice. A sufficient number of fire buckets (used in case of fire only), kept always filled, should be distributed con-

spicuously over the premises. Each theatre should have at least two firemen (one on each side of the stage). Every play-house should be connected with the nearest fire-station by electric alarms in the office and on the stage, the latter to be further thoroughly equipped with automatic alarms. Theatres should be patrolled at day and night by watchmen, who should be controlled by electric watch-clocks, with stations distributed over various parts of the buildings, records to be kept on file for the examination of the inspector. No smoking should be allowed in the theatre, except where required on the stage in the representation of plays. Steam or hot water should be exclusively employed for heating. Scenery and other stage supplies should not be stored on the stage, but in a separate fireproof dock. No more scenery should be put upon the stage than is necessary for at most two performances. The use of fireworks, Roman candles, red fires, &c., should only be permitted when it has been shown to the theatre inspectors' satisfaction that the scenery and gauzes have been impregnated by proper substances, and that the woodwork has been covered by some satisfactory solution. Wads of pistols and guns should be of hair only—not paper or cotton. If straw, hay, or any other easily inflammable substance be required in a scene, it should be impregnated and be removed to a fire-proof place immediately after the scene in which it is used." So much interest was manifested in an exhibition of some *fire-proofed* (impregnated) substances and the results seemed to be so novel to many of those present that, perhaps, a few additional remarks may not be amiss. Ten years ago I wrote:—"The experiment of making certain pieces of decoration of an incombustible material has been tried many times, and with considerable success. Especially the flies, as being most exposed, and hanging among the border-lights, have in some cases been made of fine wire gauze. The interstices were then filled with an incombustible substance, and the flies were then painted in the usual manner. This method certainly gives entire security against fire, and the greater amount of first cost is more than counterbalanced by their greater durability; but the inconvenience of handling such pieces is greatly increased by their greater weight, making them practically impossible for drops, and larger wings and flats." Another device is to protect the wood and canvas by painting it with suitable materials, and thus to make it incombustible. After the rebuilding of the Opera House at Munich (destroyed by fire, 1823), the woodwork was given a few coats of water-glass. This kept well for twenty years, but later trial showed that the coating of water-glass had changed its chemical composition, and gave no further security. Water-glass is further objectionable on account of the gloss it imparts to scenery, thereby reflecting light, and spoiling the artistic effect of the painting. The impregnation of scenery before painting has been strongly advocated, and especially of the aforementioned flies. Some of the different substances used for this purpose are alum, sodium sulphate, borax, the soluble fluorides, and calcium sulphate. It was claimed that by impregnation canvas became so far incombustible that it could neither propagate flames nor glow for any length of time, and even under great heat would only char. After the fire at the Berlin Opera House the authorities ordered the soaking of all scenery in a solution of alum. The same question was raised and given to a commission to decide some twenty-five years ago in Paris. On account of the report of this commission an ordinance was issued enforcing the impregnation of all scenery. This was carried into effect in several theatres until, unexpectedly, some impregnated gauze was set on fire by the heat of a candle. The mayor had the case investigated. It was found that the ingredients used had lost their protective power, and had changed the chemical composition of the paint. The writer ascribes the failure of these experiments to the manner in which the process was conducted; the canvas being in all cases merely soaked in the solution, and then dried and painted. If a piece of canvas is soaked in water-glass and allowed to dry, the liquid in losing its water will contract more and more, until finally solid particles will sit loosely on the yarn of the canvas. Again, sodium tetra-silicate (water-glass being soluble in water), is dissolved on coming in contact with water. The

water-colours used in scene painting may therefore have dissolved the greater part of the silicate at the start. To obviate this the author would suggest the following:—After thoroughly soaking the canvas in water-glass it should be placed in a dilute solution of hydrochloric acid; this would precipitate the silica inside of the fibres of the yarn itself. The reaction being the formation of silica, sodium chloride and water—viz., $\text{Na}_2\text{Si}_2\text{O}_5 + \text{HCl} = 4\text{SiO}_2 + 2\text{NaCl} + \text{H}_2\text{O}$. The silica, being insoluble in water, could not be washed out, and, on account of its precipitation in the fibres, could not readily be thrown out, this process being a parallel case to the use of a mordant in dyeing; the linen in that case being first soaked in colour, and this then precipitated (made fast) by the mordant. As silica has no gloss, this process would also get over that difficulty. Of course, any other incombustible substance precipitated into the fibres will will answer as well as the above. Other solutions recently recommended for the purposes of impregnation are: Versmann's and Oppenheim's, who advise a solution of 2 parts of sodium tungstate with 3 parts of sodium phosphate; Nicoll, one consisting of 6 parts of alum, 2 parts borax, and 1 part dextrine dissolved in soap-water; Siebdrath uses 5 parts of alum, 5 of ammonium phosphate, and 100 parts water; Patera, 15 parts borax, 11½ parts of sodium sulphate, and 100 of water; Martin (see later invention further on), 8 parts ammonium sulphate, 2½ of sodium carbonate, 3 parts boracic acid, 2 of borax, 2 of starch, and 100 of water. And very recently it has been suggested to use a solution of magnesium chloride. The combustibility of scenery is also greatly lessened by painting it on both sides, as the fuzz on the back of scenery, along which flames spread, is thereby destroyed, &c. Scenery might be made much safer than it is by simply whitewashing the back of it, thus destroying the fuzz. This is an exceedingly cheap and simple operation, and there can be no excuse for not carrying it out," &c. And in the latter committee's report: "The only manner in which the dangers of fireworks may be lessened is by 'impregnating' all scenery and gauze by approved processes. Your committee has for the past six months experimented with all ascertainable processes of impregnation. A process which your committee has found to be deserving of entire public confidence is that of Dr. J. Fafen, of Frankfort, Germany. Satisfactory results have also been obtained by the processes of Gautsch and Judlin, by sulphate of ammonia, and by silica deposited in the fibres by precipitation. Besides impregnating the scenery, the woodwork should be covered with some fire-proof paint. Your committee experimented with a large number of solutions, and had most satisfactory results from real 'asbestos paint,' and especially from the so-called asbestos concrete." I will now add that the following processes are patented in the United States: 1. Zappfe, No. 199,950, Feb. 5, 1878; 2. Mathes, No. 254560, March 7, 1882; 3. Bartlett, No. 300,190, June 10, 1884; 4. Fröhlich, No. 310,404, January 6, 1885; 5. Smith, No. 314,886, March 31, 1885; 6. Konrad, No. 319,100, June 2, 1885; 7. Martin, No. 331,312, December 1, 1885; 8. Sornberger, No. 362,232, May 3, 1888; 9. McIntyre, No. 391,327, October 16, 1888; and McIntyre, No. 391,261, October 16, 1888. The compositions of which are roughly as follows: (Those specially interested can readily look up more thoroughly the specifications in the Institute library.) 1. Zappfe.—Hydrochloric acid (purified by chloride of barium), carbonate of lime, crystallised alum (with potash base), chlorate of ammonia, borax and water. 2. Mathes.—Two parts soda, 1 part alum, ½ part borax, ½ part potash, 6 parts water-glass, and water. 3. Bartlett.—200 gallons water, 400lb. sodic chloride, 200lb. ammonium chloride, and a solution of 156lb. carbonate of potash and hydrochloric acid, neutralised by 75lb. of bicarbonate of soda. 4. Fröhlich.—Compound of silicate of soda, alum, sodium chloride, and phosphate of ammonia. 5. Smith.—Sulphite or hyposulphite of soda with muriate of ammonia; common rock-salt is added for incrustation. 6. Konrad.—Solution of sulphate of ammonia, carbonate of ammonia, borax, bichloride of mercury, peppermint, carbolic acid, bitungstate of soda, and chloride of lime, transformed into an emulsion by leading into the solution the products obtained from the distillation of a solution of Peruvian balsam and camphor in acetic ether. 7. Martin.—(Specimens of inflammable substances treated by this

process were shown and tested at the meeting.) Glycerine, ammoniacal salts, and fire-resisting and preservative substances. Specified as 2 parts by weight of glycerine, 1 carbonate of ammonia, 8 hydrochlorate of ammonia, 8 soluble cream tartar, 8 oxalate of potash, 8 boracic acid and water. 8. Sornberger.—1 gallon water, 1½lb. chloride of sodium, 1½lb. chloride of ammonium, 10 to 30 grains potassium permanganate, 4oz. sodic sulphate. 9. McIntyre.—Ammoniacal and preservative salts and sulpho-ricinoleate of ammonia. I have had occasion to test the latter with good results. It is claimed that the sulpho-ricinoleate prevents the dropping out of the salts: which in case of the Martin process is accomplished by means of glycerine. The trouble with most solutions has been that when the salts have, in the course of time, become thoroughly dried they drop out of the fibres; this can be prevented by using a hygroscopic substance in the compound, as glycerine in the Martin process, which, although in minute quantities, continues to absorb moisture from the atmosphere, thus preventing the absolute drying and disintegration of the salts. I can see no reason why other hygroscopic substances, such as calcium chloride, zinc chloride, &c., will not serve the same purposes as glycerine in such compounds. Laws making the treatment of scenery in new theatres compulsory (as in New York) have not been successful. Although the "stock" scenery of a new theatre must be impregnated before the play-house is allowed to be opened, the travelling companies, with each piece, bring in materials which have not been treated, and which may cause a fire. The only remedy would be stringent laws and heavy fines against the use of any untreated materials. A large smoke-flue should be provided above the stage. Automatic devices are recommended. These, and the reason for their introduction, I described in a former paper. That the public itself may have control in this matter, a complaint book should be laid open to the public in every theatre, where any individual may enter faults of construction or arrangement which he has noticed. This book should not be the property of the proprietor of the theatre, but should belong to the Theatre Inspector, the Fire Marshal, and Building Inspectors. The workshops and paint loft should be outside of the stage building. Ground plans of the auditorium, giving a clear idea of the building, corridors, stairways, &c., should be prominently located in the halls, and should be printed on the back of programmes. We all know by experience that any matter which devolves on a number of persons, especially when their time is fully occupied by other duties, is done badly, or not at all. As the old adage as it, "Everybody's business is nobody's business"; therefore, in order to keep control of the various theatres, a theatre inspector should be appointed, who should have full power to enter a theatre at any moment, and whose duty it should be to see that these or other suggestions, made law by ordinance of councils or an act of legislature, are faithfully carried out, to inspect watchmen's records, &c., test fire appliances, and once a month make a report on each theatre. These reports should be kept on file by the Director of Public Safety, and can be used as evidence against managers, or against the inspector, should he become derelict in his duties. I quote an Underwriters' Association report, in order to give a general idea how such reports should be made (I purposely do not give the name of the theatre, which, since this inspection, has been somewhat improved):

Date.....
Report No.....
Location.....

Building and Fixtures.—Walls, brick; roof, tin and slate, mansard in rear; cornice, wood (boxed); walls coped 5ft. lower than building adjoining on east; 12in. between front communicating building and theatre on south; skylights, thick glass, no screws; columns, iron in galleries; galleries, two; ceilings, plastered; communication to front building, occupied by merchant tailor, gas-burner company, and offices and lobby of theatre; fire-shutters and doors, none; heating, by furnaces, well arranged; lighting, city gas, each section separated, and controlled at gas-table on stage; gas lighted by electric spark; border, foot-lights, &c., caged; proscenium, arch, frame; electric arc lighting in lobby and in front on street.

Fire Protection.—The fire protection consists of a

3in. stand-pipe supplied by city main, with only one outlet which is in property-room at rear of stage, 75ft. of good linen rubber-lined 2½in. hose attached to stand-pipe by globe valve and Jones coupling; one cask for water each side on stage and one in flies on the prompt side; six metal fire-buckets each side on stage and two each side in flies; running water on O. P. side of bridge; no buckets in auditorium; watchman nights and Sundays, no clocks; city water 27½lb. pressure at 3 p.m.; smoking allowed only as the business of the play demands. **General Information.**—No boiler; ashes loose; waste-paper, sweepings, and rubbish allowed to accumulate under stage; carpenter work done on stage; glue heated by gas on bridge safe; water-colours only used for scene-painting; scenery stored on stage; property and dressing-rooms in rear of stage, separated by frame partition; water-casks and fire-buckets very much neglected; in one instance water-casks had fallen apart for want of proper care. The theatre building is in direct communication and one and the same risk with building where the merchant tailor tenant is using a gasoline pressure stove for generating steam in sponging cloth, carrying from one to five gallons of gasoline on second floor; the theatre building proper was originally an old stable. Building in fair repair; order and cleanliness poor; management fair. **Improvements.**—We suggest that all gasoline and gasoline stoves be removed from building at once; fire-buckets and water-casks to be regularly attended to and kept full of water; one dozen additional fire-buckets be distributed in galleries on hooks; all waste paper and sweepings be removed from building, and under stage not to be used for a general receptacle for waste paper, sweepings, and rubbish. And now, in conclusion, permit me to touch another point, which, however, I do with some diffidence. Being a resident of the fifteenth ward, I am fully imbued with the positive general necessity of the proposed 6,000,000dols. boulevard to the park. We are all in accord with the movement to create additional breathing spots in our city, and to expend a large sum of money to beautify the surroundings of the bourse. But where, permit me to ask, are we more in need of open spaces than around our places of amusement where thousands nightly congregate? The only way which theatres can be made safe is to place them fronting broad streets not less than 60ft. wide, with wide open spaces on both sides not less than 20ft.—30ft. would be better in width. Then fire-escapes, which are what the name implies, can be erected, and not arrangements the descent of which test the skill of an acrobat in broad daylight. The best system of fire-escapes is that of separated brick towers as introduced for permanent stairways in some of our well-constructed manufactories. I believe we have a right to require of our legislators that they prohibit the erection of additional fire-traps. But what shall we do with our present theatres? Force the Legislature to make them safe by Acts regulating their surroundings.

AN ARCHITECTURAL TOUR IN 1634.

IN this pleasant time of year, "When longen folk to gon on pilgrimages, And palmeres for to seken strange strondes, To serve halwes cowthe in sundry londes," it may not be out of place to describe such a pilgrimage of more than 250 years ago. According to the manuscript, which is in the Lansdowne collection at the British Museum, three gentlemen of Norwich determined to visit some of the principal towns in their native country. In that age—before railways, before coaches, before stage-waggons, and in places, one might say, almost before roads—this was a sufficiently enterprising resolve. The travellers were a captain, a lieutenant, and an ancient (or ensign) of the military company in Norwich. They set out on Monday, August 11, 1634, made a "survey" of 26 counties, and were absent from home about seven weeks. Their object was not entirely architectural; but architecture was a thing which they much appreciated, and the most interesting parts of their journal are those which relate to the buildings they saw. The first night, "with soldiers' journeying ammunition"—whatever that may imply—they "marched to the maritime Towne of Lyn." Next morning they consulted, and thought it hardly safe to pass the "Washes," which were

neither firm nor fit for travellers, by reason of the new-made sluices and devices for turning the natural course of the waters. The Wash, apparently, had begun to be reclaimed from the sea—and so, instead of crossing it, they turned south-west to Wisbech. Here they spent an hour, viewing the army of artificers who were at work on drainage and navigation schemes. "Longer," they say, "though willingly we would, we durst not stay, for that Sol's fleet coursers would have outrun our jades." They posted, therefore, over Tid-Sluice—on the border of Norfolk and Lincolnshire—arrived at Spalding, and spent the night at the Castle. The river was not deep enough to drown a mouse; but the fen drainers had undertaken to make it navigable, and 6ft. deep, from Fossdyke Slough to Deeping. Five hundred men were then at work on this undertaking—a very important one at a period when the rivers, in the East of England, formed the readiest channels for the carriage of heavy goods.

Our tourists' next stopping-place was Sleaford. There they spent an hour in viewing "the fayre church and monuments." Of these last the chief were Sir Robert Carr's and Mr. Walpole's. Then they came in view of Lincoln. Like many more people, when first they espied the high towers of the cathedral, they thought it near; but it proved, to their sorrow, to be distant "a full jury of miles." Arrived there, they at once visited the Norman castle, then used as a gaol. The gaoler mistook them—apparently because of their green uniform—for "Clerks of the Green Cloth," and after being at first extremely civil to them, became in the end extremely suspicious. They gave him a fee, however, and sent him back to his gaol—"indeed," as they said, "the fittest place for him." Then they "addressed themselves to hear the cathedral prayers, and see the ancient monuments and varieties of that stately and magnificent minster." Amongst other tombs, they saw that of "Queen Elinor, wife to Ed. I., with her bowells in copper"; that of Bishop Sutton, in the same reign, who died in his pulpit, preaching; and that of Bishop Alexander, who built Newark, Bambury, and Sleaford Castles. Then they went on to Newark, and saw "that strong, spacious, and stately castle, wherein his Majesty with his Royal Consort did lodge"—now, in our days, a heap of ruins. But Newark steeple has lasted on, and still "standeth by his beautiful spouse, the church, like a proper bridegroom by his neatly-trimmed bride."

At Doncaster they put up at the "Three Cranes," and went on to Pomfret, passing, on the road, by Robin Hood's well. Here they were sworn and knighted, according to the custom of travellers, the fees amounting to fourpence each. At Pomfret they surveyed the "high and stately, famous and princely, impregnable castle and citadel, which for situation, strength, and largeness, may compare with any in this kingdom." The castle had seven towers, of which the Round Tower was the highest: and in this, tradition asserts that Richard II. was murdered. York was their next destination, and they reached it late on Saturday night, having done a very creditable week's work, considering the nature of the roads and the amount of looking about that had accompanied the travelling. York, they tell us, was built in the reign of King David, a more than doubtful story, whether they refer to the Welsh or the Hebrew monarch of that name. They victualled at the house of a loving and gentle widow, who welcomed them with a glass of good sack and a dish of hot fresh salmon, and took such care of them that she seemed a mother rather than a hostess.

On Sunday morning they prepared and fitted themselves to attend the Cathedral service. The archbishop's chaplain preached, and the pulpit stood "in the midst between the quire, the high altare, the archbishop's seat, and the organ." There was "a Paul's Cross auditory," including the Lord Mayor, the twelve aldermen, the sheriffs, the recorder, the vice-president with his grave and learned counsel, and "many knights and gallant ladies that reside in the old city." Altogether, our travellers looked upon it as a second London. After he morning and afternoon services, they spent most of their time in the Minster. There they found a rich and rare library. They saw the place where St. William's shrine formerly was, and his tomb, 7ft. long, some time covered all over with silver. On the breaking up of the monument, King James commanded his

bones, which are large and long, to be kept as they are, in the vestry." Here were also kept the sumptuous vestments of the church—"the gorgeous canopy, the rich Communion table-cloths, the copes of embroidered velvet, cloth of gold, silver, and tissue, of great worth and value." There was also a dainty, sweet, clear well, called after St. Peter. The chapter house seems to have excited even more admiration than the minster. At the entrance, over the doors, was "framed our Saviour's picture, in his mother's arms, and St. Peter and St. Paul on either side." The "strange, miraculous roof, which is most beautiful and rare to all that behold it," still commands admiration, and the building still merits the inscription, which, in our travellers' time, had not long since been put up: "Ut Rosa Flos Florum, sic est Domus iste Domo-rum."

Their first task on Monday morning was to ascend the central tower by a staircase containing 270 steps, but that these loyal subjects accounted no labour at all, his Majesty having but lately done the same thing. After taking a view of the city, which then contained 28 churches, they went over the house and grounds of Sir Arthur Ingram. The gardens were "adorned with many kinds of beasts to the life"—whether executed in topiary work or in something more permanent does not appear. There was a fine tennis-court, a delightful bowling-ground, and curiously-contrived fish-ponds. The house itself seems to have been less remarkable than the furniture and the plate. It almost adjoined the Minster. The next place visited was the manor, formerly St. Mary's Abbey, but then used for the Lord President's lodgings. On Tuesday morning our tourists thought it time to depart from York, though they "would willingly have stayed longer to hear a famous scholar tried for blasphemy in the High Commission Court." Denying themselves this pleasure, however, they spurred on for "Topcliffe, near Spur Rippon," found good entertainment though the town was small, and went on next day to Durham. Their account of it is still accurate, though within the last half-century the marvellously picturesque spot has been surrounded by a legion of mean streets and petty dwellings, like an army encamped to besiege it. Still, however, the cathedral is "placed on the top of the city, all on a rock, like a hill in a dale." Still the castle and the heart of the town are close beside it, and still they are "environed and nigh girt round by the river Wear." In the cathedral they found, amongst many other things of note, "a font not to be paralleled in our land, with a wooden cover opening like a four-quartered globe, 'carved with such variety of joiner's work as makes all beholders to admire.' There was a remarkable clock, showing the moon's age, the day of the month, &c., and 'a fair communion table, which cost £200, of black branched marble, supported by six fair columns of touchstone.' This had been erected at the cost of the dean, Dr. Hunt, who was then living, and seems to have been an unusually late example of a stone altar in an English church. It would take up too much space to enumerate all the other marvels of Durham Cathedral, its monuments, its manuscripts, and its vestments. The singular bronze knocker which still exists there, and which is said to have been meant for the use of persons seeking sanctuary, is not referred to.

From Durham to Newcastle was the next stage. This town was then surrounded by a strong and fairly-built wall, with many towers thereon. It was governed by a mayor and twelve aldermen; and "the last mayor and now recorder did both endure knighthood" during his Majesty's late progress. The town-hall, the castle, the "neat cross," and the four churches were all visited; but no remark is made on the striking tower of St. Nicholas. At Hexham, on the way to Carlisle, it is noted that the large cathedral-like church is much defaced and decayed, and unseemly kept. Carlisle Cathedral was little better. It is described as looking like a great wild country church—not beautified nor adorned one whit. It contained the monument of Snowden, the bishop "that preached Robin Hood to our late renowned king." Does any other record exist of such a sermon—or does anyone now know what was the meaning of "preaching Robin Hood"? Disappointed in Carlisle, the travellers were delighted at an invitation from Lord William Howard to Naworth Castle. They were most hospitably and courteously entertained, and questioned about

various matters relating to Norfolk. Lord Howard informed them that though the united ages of his wife and himself amounted to 140 years, they only made up 25 years between them when they were married. Amongst other dishes served at table, a live roe was brought in—probably as a kind of centre ornament.

At Penrith, at Kendal, and at Lancaster, few architectural notes were made. In Lancashire the tourists were appalled by "those deep hell coal-pits," which their horses were the first to discover, and by their snuffing helped them to escape from "this black and dismal danger." Avoiding these perils, they journeyed through Wigan, Preston, and Warrington, to Chester; at which place for the present we may leave them.

THE COLUMBIAN EXPOSITION BUILDINGS.

THE Government Buildings in the World's Columbian Exposition of 1893 will be a remarkable example of iron construction. The central dome is 120ft. in diameter, is surrounded by a series of galleries, and will be covered alternately by curved and straight-pitched roofs. These roofs are 50ft. span from centre to centre of columns, which are of Phoenix section. The main rafters are of two angle-irons, 6 by 4in., weighing 72lb. per yard. The struts are T-shaped, ends of which are riveted to suitable connecting plates with steel pins 2½in. diameter. The truss is tied to the columns by T irons 7ft. below the springing. The straight-pitched truss may be described as being composed of an inverted king and queen post to each principal rafter, the two trussed rafters being tied together by square 1½in. tie-bars. The curved roof is of similar construction, but has a central skylight surmounting it. The tie connecting the end of each truss to the column which cuts off the angle of each roof is an important feature, in securely connecting the truss with the columns, and in giving transverse rigidity to the structure. These angle ties or brackets improve greatly the appearance, and give a sense of stability to the light construction. The columns are of the Phoenix type, rolled in four segments and riveted together, and are 45ft. in height. As an example of economical iron construction that is capable of speedy erection, these buildings will probably be unsurpassed from an engineering point of view. The variety in the plan and type of construction of these several buildings is instructive to the student. In every case the sections of members and connections are of the simplest kind, generally angle-irons, single or duplicated, for struts and rafters, square bars for the tensile members, and lattice arrangements for the principal girders. The possible variety of arrangements which may be adopted will be seen, no doubt, in this forthcoming exhibition of the world's material progress.

CHIPS.

The name of William Woollett, of Brixton-road, S.W., surveyor and architect, appears in Tuesday's *Gazette* among the adjudications in bankruptcy.

It is stated at Maidstone that West Malling Abbey has been purchased by a lady, who intends to "restore" the fabric and dedicate it to the use of a community of "Enclosed Sisters of the Benedictine Order."

A Boston journal announces, but the statement must we fear be classed among the tall stories, that "we have decided to erect a school-house large enough to accommodate 500 scholars three stories high."

At the last meeting of the Halifax town council on the 6th inst., a report of the Technical Instruction Committee was presented, in which the approval of tenders for the erection of a new technical school was recommended, the total cost being £12,409. This led to a lengthy discussion, and it was decided that the matter should be deferred until after the November elections.

Mr. Justice Romer has pronounced his judgment in the Hickling Broad case. He decided that the plaintiff, Mr. Micklethwaite, who desired to prevent anyone from fishing or shooting in the Broad, has established his ownership of the water, as the successor to persons to whom it was awarded by the Inclosure Commissioners in 1808. The learned judge held that the Broad is not tidal. The plaintiff was entitled to his costs in supporting his contention on these points, but Mr. Justice Romer declined to restrain the defendant from boating on any part of the Broad.

ILLUSTRATIONS.

FURTHER ILLUSTRATIONS OF THE DESIGNS FOR THE NEW MUNICIPAL BUILDINGS, OXFORD.—HOTEL DE VILLE, OUDENARDE.—USEFUL MODERN FURNITURE FROM THE HOME ARTS EXHIBITION.

Our Illustrations.

NEW MUNICIPAL BUILDINGS, OXFORD.

LAST week we illustrated the selected design for this work, besides three out of the four other designs in the final competition. We now give further illustrations of these designs in detail, and also illustrate the remaining scheme, which was submitted by Mr. Ernest Runtz. This design was reckoned second in merit by the referee, Mr. T. E. Collcutt, who, however, said in his report that "in neither of the designs would" the council "have a building equal in architectural merit to those erected in Oxford in recent years." Mr. Runtz claimed economy, simplicity and directness of plan, concentration and intercommunication of all departments, avoidance of internal open areas, retention of vaults under present Corn Exchange, complete natural lighting throughout, special attention to ventilation and warming, ample entrances and exits (six in all) to the town-hall and concert-room, provision for future extension. The following abstract from his report gives a description of the departments. The town-hall and concert-room are situated upon the first floor in the rear of the library, are bounded on the north by the grand staircase hall and foyer, and on the south by Blue Boar-street, access being given by the former to the principal portion, other approaches and exits from the latter. The police and administration of justice departments are retained in the rear of the site, the official portion of the former being on the ground floor, the latter on the first floor; they are distinct from the other departments, although (in common with all other portions of the building) arranged for intercommunication if desired. The entrances are from Blue Boar-street, inasmuch as police-courts and offices are objectionable in any main thoroughfare, such as St. Aldate's-street. The municipal offices occupy the northern portion of the façade; they adjoin and communicate with the town clerk's offices, and form one block. The approach is by a flight of steps facing the tower. The public library is at the south-west corner of the site, approached directly from St. Aldate's-street. The whole of the offices available for daily public business are on the ground floor, with other various approaches opening directly into the entrance hall on the north and east sides of the same. The planning is based upon the principles generally approved and adopted in municipal offices—viz., clerks' offices are used as thoroughfares into private rooms. Accommodation is provided for 26,000 volumes in the lending library and bookstore. The newsroom accommodates 40 readers, and the magazine room 56 readers. The reference reading-room has accommodation for 7,000 volumes. The ventilation for the town hall is arranged in two systems—one for use in winter,

and the other in summer. 2,000 cubic feet per head per hour of fresh, filtered, and warmed air was arranged for an audience of 1,400, propelled by a 7ft. fan specially designed. For summer ventilation the fresh air would be propelled at the lower portion of the hall, and would pass away by the openings of the sliding-roof. The materials proposed to be used were Monk's Park stone, and Box Ground Bath for external work. The town hall to be largely decorated in fibrous plaster and low relief; the council chamber in wainscot oak. Of the architectural treatment, the author says: "I venture to think that the designs exhibit a distinctly original treatment of Gothic Renaissance, both characteristic and unique, with an idea carried throughout the plan. I do not pretend to have discovered anything new, but only to have developed a style unlike anything in Oxford, but yet harmonising with the surrounding buildings. The main block of buildings has been set back, which materially assists the appearance. The skyline is varied and picturesque." No doubt of the grouping of this design, in the words of the referee, it may be said "the general idea of the architectural treatment, is decidedly superior to" Mr. Hare's design. Mr. Collcutt thinks, however, that the detail is not equal in merit to Mr. Hare's, "and certainly does not bear out the impression made by the elevation in the first competition." Our own opinion of the merits of these five designs, which we have now placed before our readers by these illustrations, was clearly set forth in our review published on June 24 last.

USEFUL MODERN FURNITURE, HOME ARTS EXHIBITION.

THE Coffin which comes first on this illustrated sheet is made in unpolished walnut, and was one of the most successful pieces in the exhibition. It is an adaptation from an old Italian example, but although receiving its inspiration from that source, the general design has had new life imparted to it by the character of the mouldings and quaintly spread legs—all in good taste and free from apparent effort. Indeed, the plainness of every part, except the one carved panel in front (which we take to be really the only old part of the design), is one of its chief merits. It is capably put together, moreover, the design of construction being worked out by Mr. C. Voysey, architect. It comes from the Stepney class, and Messrs. Herbert Shaw and Jas. Lewis are responsible for carrying out the work. The Looking-Glass from Bolton-on-Swale is adapted from an old panel by Miss Beatrice Carpenter. It is pleasing in its novelty, though not of equal merit throughout, and the construction struck us as being capable of improvement. The woodwork is oak stained green. The Hall-Chest is executed in unpolished oak and forms a most useful piece of furniture. The upper part is arranged as a chest, while beneath are two drawers, a cupboard, and a handy recess. The design of the turned legs is the weakest part, as it hardly accords with the archaic character of the carving. Messrs. Thomas Dobson, Robert Brown, George Taylor, Frederick Atkinson, and Charles Lennick, of the Gainford class, were associated together in its production. The Drawing Whatnot from Penshurst is a capital solution of the difficulty of what to do with our portfolios, which will appeal to all architects. The design, too, is good and appropriate. The character imparted to the two front posts, while keeping all the carved work without projection, is decidedly clever. Beneath the shelves (which are adjustable to required heights) is a drawer; and again, beneath this, two side cupboards, and one in the centre recess, which latter would be well-nigh useless. It is executed in walnut from the design of A. and J. Escombe; the square panels are evidently adapted from the panelling of an old house at Exeter, now at the South Kensington Museum. Messrs. G. Totman, T. Izzard, and Albert Izzard did the carving and construction. We gave a full report of the exhibition in our issue of June 17.

DETAILS OF HOTEL DE VILLE, OUDENARDE.

We printed in our issue of March 18 last details of the dormers at the above building. We now give a reproduction of the ground-floor arcade from the working drawings of Prof. Hillespulle, the architect of the restoration. We are indebted to M. Vincent Lenertz for his courtesy in lending us the drawings, and we hope shortly to publish details of the clock tower in the centre of the façade.

UNIVERSITY COLLEGE ARCHITECTURE RESULTS.

A.—FINE ART.—1st Class Certificates: W. J. Keith, Donaldson Medal; Miss G. M. Mulley, Book Prize. 2nd Class Certificates: Clyde Young, W. C. Brown. B.—CONSTRUCTION.—1st Class Certificates: W. G. Hazell, Donaldson Medal; A. F. Wickstead, Book Prize; H. G. Church, C. L. T. Griffith. 2nd Class Certificates: A. R. Hennel, G. H. Coles, Clyde Young. PROFESSORS' PRIZE FOR SKETCHES.—W. C. Brown. CARPENTERS' COMPANY'S PRIZES.—Architectural Drawing: Theobald. Constructional Drawing: H. J. C. Kühl, A. Hayward. N.B.—Prizes and certificates lie at the office of the College.

COMPETITIONS.

YORK.—The committee appointed to select a sculptor to execute the bust of the late Duke of Clarence and Avondale, to be placed in the entrance hall of the new Courts of Justice, in Clifford-street, York, assembled on Wednesday week in the Mansion House, in that city, for the purpose of inspecting the busts which had been forwarded by the following competitors:—A. N. Hossay, York; W. D. Keyworth, London and Hull; G. W. Milburn, York; D. W. Stevenson, Edinburgh; J. Verheyden, London; Walter Merrott, London; George E. Wade, London; W. J. S. Webber, Harrogate; F. J. Williamson, Esher; Joseph Whitehead, London. The committee unanimously gave preference to the two models executed respectively by Mr. W. D. Keyworth, of London and Hull, and Mr. F. J. Williamson, of Esher. On these a vote was taken, and it was in favour of Mr. Williamson, who has already produced a fac-simile for the Queen. The bust and pedestal are to be executed within three months from the present time.

SCHOOLS OF ART.

NATIONAL ART TRAINING SCHOOL.—Sir James Linton, P.R.I., distributed the prizes to the students of the National Art Training School at South Kensington on Tuesday. Mr. John Sparkes, the principal, in his report, stated that the students gained in the national and local competitions of 1891 1 gold medal, 3 silver medals, 5 bronze medals, 9 national competition books, 119 third-grade prizes, and 30 prizes of a lower value. The students in training, national scholars, and free students who took honorary awards obtained 4 gold medals, 16 silver medals, 23 bronze medals, and 62 national competition book prizes. In the local competition, open to students of these schools only, 10 silver medals, 21 national competition books, and 4 third-grade prizes were awarded. At the third-grade, or highest art examinations, 35 art certificates were obtained by students in the National Art Training School. Twenty students obtained prizes for passing "excellent." At the second-grade examinations in May, 26 students obtained 30 prizes, 32 passes were obtained, and 8 obtained the second-grade certificate. The holders of the travelling scholarships were Mr. John H. Parkyn with the gold medal, Mr. H. C. Innes Fripp with the silver medal, and Mr. Peter McCrossan with the bronze medal. Sir James Linton then distributed the prizes, after which he addressed the students, in the course of which he contended that since its establishment in 1849 South Kensington had fully borne its part in the development of the fine arts. As on a former occasion when he distributed the prizes, he warned the students not to neglect the characteristic features of English art for those of other countries.

The new Free Church at Moffat, N.B., was opened on Wednesday week. The church, which has been erected from plans prepared by Mr. D. B. Burnie, architect, Edinburgh, is in the Early English style. The church is seated for 700, the total cost being £4,200.

A few weeks ago the Mersey Docks and Harbour Board voted £180,000 for the improvement of the Canada, Huskisson, and adjoining docks, in order to afford accommodation for the great Atlantic liners, and at the last meeting of the Board the committee of works brought forward a supplementary recommendation to spend £27,000 more at these docks. They asked for £19,000 to construct a passage 90ft. wide between the proposed new half-tide dock and the Huskisson Dock, so as to provide 600ft. of working quays. The committee also asked for £8,000 to erect a shed at the south-east end of the Huskisson Dock. The recommendations were unanimously agreed to.

WAYSIDE NOTES.

THERE is wonderfully little doing in the architectural way, so far as concerns matters topical, politics being still in the ascendant, and holiday-making coming quickly into prominence. Perhaps if one thing has created more interest than another during the past few weeks it is the Oxford competition, Mr. Hare's success having brought to a finish an interesting struggle. The architectural elections have been swamped by the Parliamentary elections, and the result of the Association party-struggle has not made an epoch. If the professional world appears as dull and featureless to readers as to myself, I might just as well be still in Scotland, discovering hills beyond Pentland and lands beyond Forth, as commenting upon any matter in these pages.

I was glad to see the letter of Mr. M. R. Ellerton in your last issue. One of the things that have been constantly advocated herein is the appointment of assessors of special knowledge of special cases. What more disheartening to the competitor—specially acquainted with his subject—than to learn that a gentleman of absolutely no experience in that particular line of design has been appointed assessor to the competition? It is scarcely necessary to appoint two or three assessors. One good one is worth several of less skill, and too many cooks may spoil the "broth," even in the way of architectural competitions. For exceptionally-large buildings your correspondent's suggestion may be good; but in the ordinary way what is wanted is one really competent man. By a competent person I mean an architect of known experience in library planning, school designing, or whatever the subject may be, and not someone who "crams" for the work, and hastily gets up information on the spur of the moment.

From the size and character of the advertisement from the Corporation of Bournemouth, one might imagine that it announced a competition of great magnitude, and not merely a garden pavilion. It is, however, pleasing to peruse an advertisement for competition plans so thorough and complete. Youthful and not over-rich competitors will complain of the three-guinea entrance-fee, which does seem unnecessary. On the other hand, payment is offered to the six architects to be selected for the final competition, although I cannot make out whether there is to be fifty pounds between six architects or £50 each. It makes all the difference. The otherwise complete account is here decidedly vague.

I am glad that the County Council is at last likely to do something practical in the way of London street improvements. The Improvements Committee have prepared a report upon the proposal to construct a new street from the southern approach to the Tower Bridge towards the south of London. It appears that the City Corporation have arranged for the construction of an approach road from the bridge to Tooley-street, but from Tooley-street towards the south it is only possible to advance through narrow and winding thoroughfares. The Improvement Committee of the L.C.C. consequently recommend the construction of a new street from this approach road in Tooley-street to near Bricklayers' Arms at the junction of the Old and New Kent roads. A street 60ft. in width is proposed, and the committee recommend another attempt to obtain Parliamentary sanction to the adoption of the betterment principle. The total cost of the whole improvement is estimated at about £423,000, and it is said that were the street made 80ft. wide it would cost one-third more—a statement that seems to set rule-of-three at defiance. The improvement seems a sensible one. It is evidently of little use to construct a bridge with insufficient approaches. The Tower Bridge is now getting on, and in some ways approaching completion. I had a good view of it the other day when leaving St. Katherine's Dock, and again when drawing up to a quay, quite close to the bridge, on my return from Edinburgh. The process of encasing the metal work in masonry goes on apace, and soon the iron skeletons will be transformed into elaborate Gothic towers, more or less pleasing to the eye, according to the taste of the beholder. It is expected that the bridge will be opened for traffic some time next year.

Mr. John Hutton, the County Council's new chairman, is said to have shown great industry in Committee; Lord Carington, in proposing the new chairman, especially mentioning the Building Act Committee. There is always plenty of room for industry and energy in dealing with the Building Act, and if, in his new position of Chairman to the Council, Mr. Hutton can still further revise and improve this piece of legislation, it will be a great thing. By the bye, in connection with the Report on the proposed new street between Tooley-street and Bricklayers' Arms, Major Probyn has given notice to move that the Report be referred back to the Improvements Committee with a view to ascertain if it be possible to acquire land on either side of the new road, and thus insure the architectural character of the new buildings. The Report is to be discussed at next Tuesday's meeting.

The annual cholera scare is now well on. This year there seems some slight ground for taking precautionary measures, though there is no knowing, it being so easy to make an epidemic out of printing-ink. It was only a few days ago that an old lady, much interested in the treatment of hydrophobia by hygienic methods, as distinct from filthy Pasteurism, pointed out how in the great days of Pasteur, when hydrophobia was so much talked about, cases occurred with astonishing frequency in all parts of the country, where now we never hear of it. Perchance, however, the stringent muzzling order—the rigid carrying out of which, in spite of flabby sentimentalism, is something to be thankful for in these days—had much to do with this. To return to the cholera, the St. Petersburg correspondent of the *Standard* gives an anecdote related by Prince Mestcherski. The Prince was told by an ex-mayor that when he once proposed, during the last cholera epidemic, certain necessary sanitary measures, a member of the Duma (the Municipal Council) got up and declared that dirt was a national characteristic dear to every Russian, and far from endeavouring in this respect to imitate European civilisation, every true Russian should strenuously oppose all efforts to extract him from his national filth. This speech was received with frenzied delight, and the whole Duma repaired to the church to pray for deliverance not from the cholera, but from the reactionary mayor. As a sequel to this, the priest refused to perform the prayers, on the ground that it would be equivalent to praying for the death of a fellow-creature. How far the story is to be taken seriously it is, of course, difficult to say; but we do know that very many sanitary reforms on the Continent are prevented by the prejudices of the people.

The "general tone" of A.A. *Notes* for July is decidedly rural, and savours much of holiday-making; otherwise I do not see any marked change from the old management. It is a safe number for me: the articles are unsigned, so that I cannot be brought to book by black heads or greybeards for any criticisms I may venture. As a matter of fact, there is not much to criticise, the number being decidedly light and superficial. Mr. Sidney Vacher explains that he has no wish or intention to injure the R.I.B.A., so that body will be able to get along, after all. How thankful both the Institute and Association ought to be that the great crisis seems past, and that the thundered anathemas of the high-art men have not shaken No. 9 to its very foundations!

GOTH.

Her Royal Highness the Princess Mary Adelaide, Duchess of Teck, will lay the corner-stone of the permanent Church of the Good Shepherd, Mansfield-road, Hampstead, on Saturday afternoon in next week, July 23. We illustrated the church, which is being built from plans by Messrs. James Brooks and Son, in our issue of the 17th ult., from a drawing now on view at the Academy.

The deputy-chairman of the London County Council, Mr. Hutton, opened on Saturday afternoon the third and last section of Rosebery Avenue, the new street from the Angel, Islington, to the Holborn Town-hall. This improvement was initiated by the Metropolitan Board of Works, and the roadway which has been constructed is 1,173 yards in length, and has running under it a large subway. In the course of the work of construction 2,382 persons have been displaced and subsequently provided for. The improvement has cost £353,526, but the outlay will be diminished by the sale of unused lands.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

THE BRITISH SCHOOL AT ATHENS.—The annual meeting of this school was held at 22, Albemarle-street, on Thursday afternoon, the 8th inst., the Marquis of Bute in the chair. The annual report was read by Mr. G. A. Macmillan. The hon. secretary stated that the financial position of the school was still very precarious, depending as it did upon a very limited number of grants and subscriptions. Lord Bute, in moving the adoption of the report, urged the continuity of Greek life, and deprecated the vicious tendency to write the history of Greece within artificial limits. Archaeology was the handmaid of history, whose monuments she studied, recorded, and preserved, and from the purely historical point of view the mosques near the Stoa of Hadrian and the great water-clock were as much monuments of the history of Greece as was the Parthenon itself. Indeed, they were historical monuments of a most precious type, because their meanness as compared with the ancient and national structures was, for whosever saw them, an instant and striking proof of the barbarism and degradation of the Turanian savages by whom they were created, as contrasted with the greatness of the noble Aryan race who created the other. He did not argue that where one historical monument hopelessly interfered with another, as the mosque with the Parthenon, the inferior should not be removed; but such removal should only be effected after the greatest consideration, after making accurate records of what was to be destroyed, and with the careful preservation and transference, if need were, to another site of the historical monuments disturbed. From this standpoint he pleaded on behalf of mosaic floors of the Roman period, some of which he had seen in the actual course of destruction in the neighbourhood of Athens, and also advocated the study of the Byzantine monuments, both ecclesiastical and secular, the latter including the buildings of Mistrá, crowned by the Gothic Imperial Palace, inhabited at the time of his accession by Constantine XIII. Mr. Edwin Pears, of Constantinople, remarked that Byzantine work offered a field which had been practically untilled. Dr. Waldstein bore testimony to the value of the work of the British School. The Greek Minister (M. Gennadius) moved a vote of thanks to the chairman, which was seconded by Professor Jebb, M.P., and carried unanimously.

SUFFOLK INSTITUTE OF ARCHÆOLOGY.—On Thursday in last week a large party of the members and friends of the Suffolk Institute of Archaeology and Natural History had a ramble through what is well known locally as the "Garden of Suffolk." The Rev. Francis Haslewood, the hon. secretary, acted as guide for the day. The members proceeded by rail from Ipswich to Saxmundham, and thence visited by brakes the church and Wool Stاپlers' Guild-house at Kelsale, Yoxford Church, Sibton Abbey (where Mr. W. H. St. John Hope gave an address), and Dunnington Church (at which place Mr. T. E. Key read a paper).

Excavations are being made with successful results in a barrow situate within the supposed Roman camp at Grassington. The mound contains four chambers, and it is in the central one that interesting relics have been discovered, together with a large quantity of human remains. Five human skulls have been noted, with other portions of the bodies to which they have belonged. Fragments of four urns have been found, and also white flints, flint arrow heads, and a bone pin. The work is being conducted under the direction of the Rev. Bailey J. Harker, F.R.A.S.

A block of parochial buildings erected on the Victoria Estate, Wellingborough, in connection with All Saints' Church, were dedicated and opened last week by the Bishop of Leicester. The edifice, which is situate at the corner of Winstanley and Strode Roads, provides accommodation for infant day-school, Sunday-school, church institute, Bible classes, &c. It is built of red brick, with Bath stone dressings, and covered with Brossley tiles, from designs prepared by Messrs. Talbot Brown and Fisher. It consists on the ground floor of a large hall, and a classroom, cloak-room, &c. On the first floor are a suite of rooms for general parish purposes, and in the basement is cellars accommodation and a heating apparatus. Mr. G. Henson was the contractor. The cost was about £1,760.

OUR STREETS AND FOOTWAYS.

MUCH convenience would be felt if the City authorities turned their attention to the requirements of street traffic. All know the serious daily block that takes place between the Bank and the Mansion House, or even across King William-street, during a busy hour of the day, how difficult it is to find a way through the lines of omnibuses and cabs. A subway would give immediate relief to this congested focus of City life; but the City has to depend on the initiative and enterprise of a newly-formed tunnel railway company to supply this urgent need, and it is, of course, uncertain as yet whether the company will fulfil its fair promises. The subterranean obstacles to the projected scheme of subways are undoubtedly formidable; but there can be no real difficulty in uniting the pavements by foot-bridges, sufficiently high to allow headway for omnibuses and laden waggons, and the only objection that can be raised to such structures is their appearance. They may be very unsightly straight girders, spoiling the vistas of our streets, or artistically designed erections with ascending staircases suitable to the locality. Some communication is absolutely demanded at our principal crossings, and as necessary evils it is time they received attention. The repeated breaking up of roadways and footways in the City is another source of great public inconvenience. What with gas, water, and electric lighting companies, there is little prospect of a cessation of these tiresome operations, or of our pavements resuming their normal condition. Would it not be far more sensible to make companies lay down concrete or iron subways or channels with proper coverings, so that they may be opened without trouble, and the breaking up of wood or asphalt paving. Nothing appears more crude and clumsy than digging new trenches and laying pipes and channels every time a new company obtains powers. The Legislature should insist upon a more rational system.

THE ARCHITECTURE OF THE FIFTEENTH CENTURY.

THE third and last of a series of three lectures on the history and development of English architecture, by as many distinguished architects, was delivered by Mr. T. Graham Jackson, A.R.A., M.A., to the students of Toynbee Hall, Commercial-street, Whitechapel, on Wednesday evening. The lectures, which were organised by the council of the East London Antiquarian Society, have followed each other, in proper chronological sequence, at a month's interval. The first, by Mr. Aston Webb, V.P.R.I.B.A., delivered on Wednesday, May 11, had as its subject, "The Architecture of the Eleventh and Twelfth Centuries"; the second, by Mr. Alfred Waterhouse, R.A., given on Wednesday evening, June 8, carried forward the story to "Architecture of the Thirteenth and Fourteenth Centuries"; while, in the closing address, Mr. Jackson dealt with "Architecture of the Fifteenth Century." In his introductory remarks, the lecturer of Wednesday evening sketched in some detail the changes and developments in Gothic architecture which led up to the Perpendicular, or, as the late Edmund Sharpe more correctly named it, the Rectilinear style. Illustrating his points by numerous blackboard drawings, Mr. Jackson demonstrated that Pointed architecture was the outcome of expediency and economy, the use of the pointed arch allowing of the use of smaller stones than did the round arch. That it was at first adopted for purely constructional reasons was evident from the familiar fact that in the earlier examples of Transitional architecture pointed arches were employed to carry the weight and to cover large spans, while the older round-headed ones were retained as decorative features. The Gothic style was essentially one of unrest and progress; it never remained stationary. Its builders were never content with the progress already made, but each new constructional problem solved, each fresh step forward was but a 'vantage ground from which to move onwards to attack a more difficult position. A point of great importance was that the Gothic style throughout was essentially a masonry style, and its development was clearly shown by its treatment of windows and vaulting. The windows, for example, which at first were isolated lancets, were brought together in couples and in triplets, and the group was then

inclosed under a common head, which was next pierced; the piers between the windows were gradually reduced to mullions; the spandrels on either side of the circular opening in the head were pierced. At first the piercing was the principal motive of the window, but soon the bar separating the lights, and not the lights themselves, became the chief object of the designer. This change, the stages in which were elucidated by Mr. Jackson by blackboard sketches, first introduced in France, soon spread to England, and speedily developed in this country, resulting in the rebuilding of abbeys and churches on a scale of great magnificence and splendour. The builders of France used for a longer period this Geometrical phase of art, and, indeed, developed it into a thoroughly uninteresting and rigid style. Whereas for the motives of our 13th-century architecture we must admit our indebtedness to French architects, on the contrary the art of the 14th and 15th centuries was entirely our own in development, and owed nothing to France. Indeed, the examination of dates proved that the Flowing style was not adopted in France till we were on the point of abandoning it. Further, our Perpendicular style was peculiarly English, and, in the lecturer's judgment, was not surpassed in some respects by the art of any country. Incidentally, Mr. Jackson remarked that he had adhered to the titles given to the course of lectures, which appeared to group the successive developments of Gothic architecture into as many centuries; but in fact the periods, except in the 14th century, did not correspond with these arbitrary dates, and the Perpendicular style of which he wished principally to speak, although nominally a 15th-century style, was seen in full vigour in 1375 at Gloucester Cathedral, at William of Wykeham's College at Oxford in 1380, and the same builder's work at Winchester in 1387. They had now arrived at the period when Gothic art was entering on its last stage; within less than 300 years from its origin it had attained its full growth, every difficulty had been mastered, and every constructional problem solved. Nothing, indeed, seemed to have daunted the Gothic builders. From first to last, as he had already remarked, Gothic architecture was pre-eminently a stone-cutting style; the master-masons were throughout the architects of the churches and other buildings. The lecturer traced the development of the Curvilinear into the Rectilinear window. The tangential curves of the window tracery had suggested ogee forms, but now the bar tracery was carried up to the head of the window, which was next increased in width, to afford greater light and room for single-figure subjects. The head of the window was now flattened into a four-centred curve, and eventually was perfectly horizontal. The head of the window was divided into rectangular compartments, by mullions which were either cinquefoiled or battlemented. The mouldings became simpler and shallower, and this was equally marked in the piers carrying the arcades of the church, where both in profile and on plan the pier and its abacus assumed a diamond outline. The foliage capitals, the glory of the Curvilinear style, now very rarely occurred, and where they were introduced were not nearly so well designed as in earlier examples, but moulded caps were almost universal. One of the worst features was the falling off in sculpture; it was now very seldom employed, and where introduced, as in Henry VII.'s Chapel at Westminster, was inclosed in panelling, of which one could soon have too much. A great development was apparent in vaulting. The quadripartite vaulting changed into rib-and-panel treatment, in which the panel was merely subsidiary, and was frequently filled in, the ribs forming the only constructional feature. More interlaced ribs were introduced, bosses were placed on the intersections, and were gradually made more and more conspicuous features, and the ribs were all struck with curves of the same radius, so as to facilitate the work of filling-in the interspaces. Whereas the void left in a single bay of a quadripartite vault was a hollow-sided inverted pyramid, the figure formed by the void left in the new system was a hollow-sided regular cone; the plan of the first-named vault was a rectangle at every point in its height, and that of the latter a circle or ellipse. Soon the builders sought to define the cone formed by the fan-tracery by girdling it with circular bands, the plane for treatment being now regarded as horizontal

instead of vertical as before. The idea of transverse and diagonal ribs was lost, and a system of hollow cones was substituted for them. The intersecting lines as they multiplied lost their rib-and-panel motive, and in many instances, as at Henry VII.'s chapel at Westminster, both rib and panel were worked out of the same stone, and became a mere surface decoration for the lower side of the vault. It was probable that this fan tracery was first developed in roofs of the cloister walks of our abbeys, and the earliest known example was that in the cloisters at Gloucester. The lecturer referred to the magnificent effect of the style as carried out at Gloucester, King's College in Cambridge, and Henry VII.'s chapel, remarking that the latest example was at Christ Church, Oxford, executed in 1604. The woodwork of this Perpendicular period, notably as displayed in stalls and roofs exhibited great excellence and skill, and a knowledge of the special treatment adapted for the material as distinct from masonry. No such hammer-beam roofs as those of Westminster Hall, Eltham and Hampton Court palaces, and in many of our great churches, were to be found on the Continent. The style did not quite die out till the end of the 18th century, and there were many proofs that it was still followed in many villages and out-of-the-way parts of the country until that period. In conclusion, Mr. Jackson urged that the true aim of architecture was to construct beautifully, and not, as he was sorry to say Ruskin and many other writers and architects had held, to decorate our constructions.

DECORATION.*

MY subject, "Decoration," is a very wide one; but the limitation of time and other considerations urge me to confine my observations chiefly to the practical aspect of it. I might begin by sketching an outline of the historical development of decorative art, for as you know, the impulse to decorate is a universal instinct implanted in the human mind. There is scarcely a savage tribe that has not its characteristic ornaments. And even before he has learned to build a hut, or to clothe his nakedness, the savage will adorn his person with coloured pigments or tattooing, and often in devices admirably adapted to bring into relief the curvature and undulations of the body. The New Zealander is pre-eminent in this art. It is tempting to give an outline of the styles of ornament which have characterised the nations of antiquity, and to trace the symbolical meaning attached to the forms that most prevailed in each. Most of the examples that have come down to us are from their sacred buildings, and most of the ornamental forms have a sacred and symbolical meaning. Ornament is chiefly founded on plant and animal forms (of course, meandering lines of all kinds are an exception), and those plants and animals chosen for the purpose of religious symbolism were thought to express in their forms or qualities some characteristic observed in the economy of nature. Thus, her creative or generative power they thought they saw expressed in the bull and the lion. The serpent throughout all ancient religions was held in great veneration. We find that among the Hebrews it was held sacred. Moses lifted up a brazen serpent as a symbol of healing; the Greek demigod, Æsculapius, the patron of medicine and the healing art, was always accompanied by the serpent. The rod of Hermes has the male and female serpents entwined around it. Over the portals of Egyptian temples double serpents uphold the solar disc. Serpent worship to this day is prevalent throughout India. There are serpent mounds sometimes of several miles in extent spread over the old and new worlds. The serpent typified many things in ancient times. It is a mysterious creature, in whose eyes abide a weird fascination. It seemed to renew its youth by periodically casting its skin. When coiled in a circle with its tail in its mouth, it had an occult meaning, signifying perpetual generation. We see the serpent exalted into heaven as one of the constellations. In early developments of symbolic art the forms are chosen not for their inherent beauty, but for their meaning solely. So that, on the whole, symbolic styles, such as that of Egypt and the early

* Paper read by Mr. ANDREW WELLS before the Sydney Architectural Association.

Christian, are not so exquisite in form as in those styles where beauty alone is sought after, as in the Greek work and that of the Renaissance. The beetle, among the Egyptians, was held in great veneration also. It is difficult for us to understand the reason why, until on closer examination we discover the motives that influenced their choice of so insignificant a creature, for the scarabæus, or beetle, appears in Egyptian art more frequently than any other form, except the lotus-lily. The beetle lays its eggs in a little mass of excrement, and this it drags by its hind feet along the ground until it hardens in the sun; this it then buries in the earth, and in due time, quickened by the solar rays, the new birth emerges. The Egyptians seemed thus to see in the action of the beetle on a small scale, the action of the sublime Creator in the wide theatre of nature, and this likeness sufficed to endow this little creature with a divine character. Many plant forms were chosen for decorative purposes, for the like reasons. The lily or fleur-de-lis, which we now accept as the symbol of purity, is much older than the Christian religion. It and the trefoil leaf have long been used to typify the process of nature in its threefold aspect, such as the past, present, and future, the begetter, the preserver, and the destroyer, the male and female principle, and the products of these twain. In Egypt they had many inferior deities, but one great trinity, Osiris, Isis, and the child Horus. Hebrew ornament was altogether symbolical: the æsthetic principle finds no place in its art; it made no advancement. I might go on explaining why all manner of plants occupy such a large place in art and poetry. Such as the laurel, the bay, the ivy, the mistletoe, the pomegranate, and many others; but this takes me rather out of my way. But as showing how great the influence of religious symbolism has been on architecture and decorative art, we have but to think of the cross—exalted into a symbol of the passion of our Lord, and the redemption of mankind, it now forms the ground plan of all the great cathedrals of Christendom. If the cross had not thus been invested with this sacred character, our great temples erected during more than a thousand years would have been something different. Who can say how great the difference may have been? This is an aspect of my subject I would fain dwell upon; but I must confine my observations to something touching, more closely our present interests and every-day experience. A survey of the past shows us that all nations in all parts of the world have loved to decorate their temples, houses, dress, furniture, and almost every article of utility, and as in the case of Greece, we see how refined a nation so inclined may become; not to mention their matchless temples and statuary, which we may suppose the inspiration and product of their greatest artist. What chiefly concerns us here is to observe that whatever their artisans and common workmen fashioned is indued with grace, symmetry, repose, and elegance. The mason's work, such as altars, milestones, urns, and such-like, are all distinguished by these qualities. Think of the marvellous shapes of grace—the patterns, hand and eye created; how varied and how delicately fair in form; and thousands of such urns and vases fill the shelves of our museums, not one of which is crude or ungainly made. Hundreds of workmen must have shaped them on the wheel—common workmen, who yet could fashion works so very uncommon—art workmen were they all, imbued with the spirit of loveliness. What shall we say of the painters who further graced them with the perfect forms of gods and heroes? What delicacy and subtlety of touch do their firm, free lines declare! Think of the many hands engaged in this one branch of art! Here again we see the art workman who loved his work, and put his heart and soul into it. Then, how exquisite the beauty of their ornamental forms! They are the very embodiment of grace and refinement. They must have been inspired with the spirit—art. Their workers in gold and bronze are no exception. All the things they fashioned are to this day models of grace and beauty—their furniture, dress, and all their commonest things were transformed by this spirit into dreams of beauty. Our English poet Keats, who was a Greek in spirit, has declared a thing of beauty to be a joy for ever. And so, indeed, it is. Now, how do we stand in Australia as compared with the Greeks? I think that even the most patriotic must (however reluctantly) confess we do not approach

them by a long way. I am sorry to say the ordinary productions of our workmen are not distinguished by elegance of form and delicacy of finish. It is well for us to be reminded of our state, and by the example of Greece discern the goal toward which we ought to strive. A little nation were they—and not so rich as we—but their lives must have been glad and beautiful; their minds enriched with truest wealth, seeing that whatever they touched became things of beauty in their hands. While speaking of decorative art throughout the world, it may be well to say something on the subject of colour generally. This is one of the subjects that nearly everyone thinks he is an authority upon, and yet there is no topic upon which more ignorance and error prevails. A lack of knowledge prevails of what other nations have accomplished; what they throughout centuries have found to be good. A foolish notion prevails that full, rich colouring is vulgar, or is in bad taste. A belief prevails that in a warm, sunny climate rich, full colouring is unsuitable. A belief exists that dead, grey hues afford a refreshing coolness, pleasing to the eye, overlooking the fact that all the nations who are pre-eminent for their mastery of colouring inhabit sunny climes. We have only to enumerate the nations so famed to be assured of this. Think of Egypt, where they have even more sunshine than we have in sunny New South Wales, and then consider the colours they delight in. Their temple walls, within and without, and their vast columns were coloured in rich shades of ochrey-gold, the figure-painting and hieroglyphic writing brought out in deep shades of chocolate-brown; the capitals resplendent with ultramarine, white, and the richest shades of red. Their ceilings were grounded with dark blue, and the diapered patterns which crowned them shone with all the richest primary colours. Their whole scheme of colouring was full and rich—everything was decorated; even to their mummy cases and the sepulchral cases wherein they were bestowed, their colouring was full of tone and harmonious. Think of China and Japan! They are sunny lands, and both these nations are supreme as colourists. Colour does not need to be washed-out and insipid to be pleasing. It is like music, and must be harmoniously arranged. It may be gay and joyous in effect; only group colours in due proportion and proximity, and the effect will be harmonious. Think of India and Persia! how beautiful is their colouring. The beauty of their textile fabrics (such as carpets) has never been excelled. Then, when you look at decorated buildings laid bare in the excavations of Pompeii, you see what the refined Greeks and Romans thought in the matter of colouring. It was mostly Greeks who executed art work in the palmy days of Rome. Here, again, you have dark blue ceilings, and walls painted in divisions and panellings. It is common to have black dadoes and walls of rich red, broken up with pilasters and panels of black and yellow-white, and other lustrous-coloured friezes. The figure painting and ornamentation is all in rich, full tones. The Italians, who now inhabit the same country, delight in rich colouring to this day. So here you have all the great civilisations of the world agreeing in their choice of splendid colouring. It will be a long time e'er we can afford to despise the taste and judgment of so many accomplished nations. Rather let us acknowledge our ignorance, and so be in a fit condition to learn from better men. Another fact that is constantly borne in upon mind in the ordinary experience of life is the vanity and self-sufficiency of those who pretend to the possession of taste and knowledge in the absence of long and serious study. Should we call in the services of the physician, the lawyer, engineer, professor of music, or any specialist, we do not presume to dictate to him the course he ought to pursue. We recognise the folly of such procedure. But when it comes to matters of taste in form and colour, it is assumed that the individual untrained judgment is as good—if not a great deal better—than that of him who has spent his life in the acquirement of knowledge in this particular direction. A thorough knowledge of the true principles of the harmonious combination of colours is one of the rarest qualities, and can only be attained after long experience and study. True principles of art are still little developed amongst us. What do we see in most houses we enter? An utter want of unity between the painting and the furnishing. The carpets, curtains, and chair-coverings having no relation to the

wall-colouring, thus showing the want of a trained guiding mind in the selection of the whole. How often do we find the pictures hung without the remotest feeling for artistic arrangement! It is not uncommon to see them placed so high upon the walls as though it were a prime object to place them where they could not by any possibility be seen or enjoyed. But now at the threshold of our inquiry, one is confronted with the question: What then is good taste; and what constitutes good decoration? These questions cannot be answered in few words. Nothing is so common as to find the public taste running after fashion—the prevailing mode being ever esteemed the height of good taste. During the last twenty-five years I have seen many changes of fashion—in wall-papers for instance—and each during its reign has been hailed as the best and far surpassing anything that went before it. Now during all this time the skill in design and colouring brought to bear on this particular manufacture has been very great. The designs have been supplied by the best architects and artistic designers, so that at no time during the period under consideration have the designs or colouring been in bad taste—(of course I refer to the productions of the best houses) yet anyone having experience constantly finds the public to be led away with the idea that what prevailed last year, or a few years ago is old fashioned and consequently in bad taste. While during all this time the chief writers on the subject, and the recognised leaders of taste have all along consistently recognised the worth and pointed out the beauties of each year's production. Now it is quite possible for many kinds of design and colouring to be beautiful, and what was good twenty years ago need not cease to be good and beautiful simply because the fashion may have changed. William Morris the poet, and art decorator, has insisted on this truth for the last twenty years. He produced artistic wall-papers then, and has added little to the number of his designs since, but still produces what from the first he knew to be good for the adornment of our walls. And so with Jeffrey and Co.'s—wall-papers and designs they brought out twenty years ago they still print, and these are still their finest designs. Of course, as business men they bring out fresh designs yearly, for the sake of taking the market; but it does not follow that the last brought out is the best. The same might be said of furniture: there have been many changes of fashion during the last thirty years, yet during this time greater skill has been brought to bear on its manufacture than at any time in the history of the English nation. We have been going through a period of great fertility of invention in all the arts of design; but in France there has not been this listless love of change, yet he would be unwisely bold who ventured to say the French are lacking, or in any way inferior to ourselves in the matter of taste. So that the suggestion made as to what is good and suitable for decorations of our houses must be understood to be merely a selection out of many ways that would each be good under special conditions.

(To be continued.)

BOOKS RECEIVED.

Pumps and Pumping, by M. POWIS BALE, M.I.M.E., second edition revised (London: Crosby Lockwood and Son).—The author of "Woodworking Machinery, Saw Mills," and "A Handbook for Steam Users," &c., has usefully brought together, in a small compass for practical use, notes on the selection, construction, and management of pumps. Very numerous and varied are the types of pumps which are here classified. Five kinds are treated: (1) lift pumps, (2) plunger or force pumps, (3) centrifugal and rotary pumps, (4) mechanical water-lifters, and (5) injectors. Mr. Bale is an expert in mechanical contrivances, and has given the results of his practical knowledge on the points to be considered in successful and economical working. The tables and rules are simply and clearly expressed, and we can safely recommend the book to every contractor and pump user. —Notes on the Construction of Cranes and Lifting Machinery, by EDWARD C. R. MARKS, M.I.MECH.E. (London: John Heywood, Amen Corner).—The author has here published in book form a series of articles which have appeared in the *Practical Engineer*. As the information concerns a class of machinery about which

little has been specially written, we have no doubt Mr. Marks's little treatise will find numerous readers, especially among builders and engineering contractors who have brought lifting machinery into considerable use. The rules and examples illustrated by diagrams are simple and concise. Many important improvements in pulley-blocks and cranes of different kinds are described. The author's notes will enable any one who has a slight acquaintance with machinery of this kind to judge for themselves of the capabilities and merits of the usual appliances, from the simple pulley-block to the dockyard crane capable of lifting hundreds of tons. The principles of pulley-blocks are first discussed without any complicated formula, and by very simple rules; next come crabs and winches, the means of obtaining the purchase or approximate power of the crab being shown in simple arithmetic; double and treble-purchase crabs, hand-cranes, and wall-cranes are treated, and from these to pillar cranes and foundry cranes the transition is easy. The subject of derricks is fully discussed, and the chapter may be read with profit by contractors who use derrick cranes in the erection of lofty buildings; the method of finding the stresses by diagram is shown; but we do not see any reference made to the patented gearing introduced by Messrs. Thompson and described lately by us. Other chapters deal with wharf cranes, overhead travelling cranes, steam and power hoists, warehouse cranes, cage lifts, and many other forms, lifting jacks, &c., in each case the author giving practical rules for calculation.

CHIPS.

A new Roman Catholic Chapel is about to be built at Harrington, Cumberland. The architect is Mr. Charles Walker, of Newcastle and Liverpool, and the contractor Mr. James Wilson, of Workington. The church will be built of grey and red sandstone, in the Early Gothic style, and will be about 100ft. in length.

A churchyard cross is to be placed opposite the porch of Church Eaton church as a memorial to the late Col. Ashton. Mr. Bridgman, of Lichfield, is the sculptor.

Messrs. A. and C. Harston are the architects of the new workhouse infirmary at Lewisham, the foundation-stone of which was laid last week.

The third annual convention of District Councils of Plumbers of Scotland will be held at Dundee on September 7th, 8th, and 9th next, and will be attended by a deputation from the Worshipful Company of Plumbers of London.

The burgh engineer of Edinburgh has been instructed to prepare for the town council a report on the cost of the proposed Bristo-street improvement. It is expected that the cost will not exceed £20,000.

The memorial tablet to the late Earl of Lytton is to take the form of a medallion tablet in the crypt of St. Paul's Cathedral, and the work has been entrusted to Mr. Alfred Gilbert, A.R.A.

The Louvre has just received as a gift a small mediæval harp in ivory, sculptured with the figures of angels and strewn with *fleur de lys*. It belongs to the beginning of the 15th century. Just such musical instruments may be seen in the hands of angels in Flemish and French pictures of the time.

The secretary of the Royal Commission on Labour informs us that the work of taking evidence of Committee "A" and Committee "B" will be completed in the weeks commencing July 25th and August 2nd respectively, and that the work of taking evidence of Committee "C" will be completed after two or three weeks' further sittings. Any persons still wishing to give evidence before any of these committees should at once apply to Mr. Geoffrey Drage, at 44, Parliament-street.

The Art Gallery Committee of Aberdeen have obtained on loan a collection of pictures from South Kensington, numbering in all 107, besides a number of canvases from local gentlemen, and on Saturday the exhibition was formally opened, free to the public for three months, by Lord Provost Stewart.

Mr. G. F. Watts, R.A., who intends to present to the nation a collection of his works, is now engaged on the picture which is to complete that collection, and has selected as the subject of this work a portrait of Sir Andrew Clark, the President of the Royal College of Physicians.

Albert Walters, a builder, on bail, was convicted at the West Kent Quarter Sessions, on Friday, of stealing mantelpieces, window-frames, scaffold-poles, drain-pipes, and timber and wood, the goods of Frederick Adam Stigant, at Chatham. Prisoner was sentenced to six weeks' imprisonment.

Building Intelligence.

EARLSTON.—The new parish church at Earlston was opened on the 6th inst. by the Right Rev. Dr. McGregor. It is erected from plans by Messrs. Hardy and Wright, Edinburgh, in Early Decorated Gothic, with accommodation in the pews for 650, and with extra chairs for 700, at a cost of nearly £3,000. It has nave and aisles, the latter having each three gables for upper lights to side galleries, an arrangement rendered necessary by the restricted site. The church has a tower, and all interior appointments are of a superior description. The pulpit and accessories are in oak. The roof is open, with panelled timber ceiling. The walls are finished with distemper, in primrose yellow and terracotta. All the woodwork is stained and varnished a dark walnut.

HITHER-GREEN.—The foundation-stone of the new church of St. Swithin, Hither-green, was laid on Saturday week. The church, which is being erected from the designs of Mr. Ernest Newton, of 14, Hart-street, Bloomsbury, by Mr. S. C. Parmenter, of Braintree, will be in the 14th-century style, faced with red brick and with Bath-stone dressing. It is to seat 600 persons. The present contract is rather under £5,000, it being decided not to go further at first than with the erection of the nave and north and south aisles and the west gallery, leaving the chancel and the chancel aisles to be the subject of a future contract. The church will have an open-timbered roof, covered with green slates, the windows will be filled with plain glass, while over the chancel arch it is intended to place a bell turret covered with lead. This portion of the work, it is expected, will be completed within twelve months. When the whole scheme is carried through, the total length from east to west will be 120ft. At present the dimensions are as follows:—Nave, 66ft. long by 30ft. wide; north aisle, 66ft. by 12ft. 3in.; south aisles, 66ft. by 19ft., extreme exterior height to the apex of the gable, 58ft.

HORSHAM.—The new cottage hospital for Horsham was opened on the 2nd inst. The building is executed in red brick up to the first floor, and above this in half-timber work, filled in with rough cast plaster, the front portion being hung with Sussex tiling. The roof is covered with Broseley tiles and is broken up by gables having wide projecting eaves and moulded barge boards. On the ground floor are the entrance hall, with wide staircase leading to the wards on the first floor, garden entrance for patients, with w.c. adjoining, waiting-room, nurse and matron's sitting-room, urgency wards, medical stores. The domestic offices are entirely shut off. A lift is provided from the kitchen offices to the third floor. On the first floor are one male ward with three beds, provided with lavatory and w.c.; one female ward with three beds, one ward with two beds, nurse's room, surgery and operating room, bath room and lavatory, linen closet with hot tank inclosed. At the extreme end of the site are the mortuary, coal cellar, and fitted laundry. The cost of the building was £1,350. The work has been carried out by Messrs. Rowland Bros., of North-street, Horsham, from the designs of Mr. Frederick Wheeler, F.R.I.B.A., of Horsham and Chancery-lane, W.C.

LEEDS.—New printing offices are being erected in Cookridge-street. The building covers an area of 450 square yards, and will be five stories high. Messrs. William Thompson and Sons, of Chapeltown, are the general contractors; Mr. J. E. Pearson the carpenter and joiner; and Messrs. Homan and Rodgers, of Manchester, supply the constructional ironwork. The architect is Mr. Harry May, A.R.I.B.A., of Liverpool. The style is Italian Renaissance, with a Queen Anne freedom. The basement will be used as the principal printing machine-room, and here also will be the engines for driving the machinery throughout the works. A large lift runs from top to bottom of the building, and a separate fire-proof staircase for the workpeople is also provided. The main entrance is at the corner of two streets, and is a feature in the design. On the ground floor are placed the counting-house, proprietors' room, wholesale stationery department, another machine-room, and packing-room. From the hall a staircase in wood leads to the first floor, upon which are situated the manager's room and offices, bookbinding and lithographic

departments, storerooms, &c. The second floor is for the compositors and stereo-room, and the third floor entirely for compositors. The walls of the basement are lined with white glazed bricks, and the other walls and ceilings are to be plastered. The exterior is broken up by gables, projections, and cornices. The lower portion of the outside walls is lined with blue Staffordshire bricks. The general walling is of red patent bricks, and the strings, cornices, &c., are of local stone. Above the main entrance is a stone oriel window, and then rises a tower to the height of about 100ft., the upper portion of which will be used as storerooms.

SHREWSBURY.—The chancel of St. Mary's Church was reopened on Monday week, after undergoing restoration. The unsightly seating and screens which were placed in the chancel about forty years ago for the use of the boys of the Grammar Schools (and since the removal of the schools to Kingsland no longer used by them) have been removed. The floor spaces have been levelled and the steps rearranged. The chancel and sanctuary floors are laid with encaustic tiling by Messrs. Godwin and Son, of Hereford. The steps are of polished Anglesey marble. A chancel screen of Grinshill stone has been erected, in four of the niches of which are placed statuettes of St. Mary, St. Joseph, St. Oswald, and St. Birinus, the work of Messrs. Earp, Son, and Hobbs, of London. The altar table has been brought further forward than formerly, thereby opening out the Norman arches in the east wall. A Norman sedilia has been exposed to view in the south wall. The arcade between the sanctuary and the South Chapel has been filled in with wrought-iron grilles, representing a vine, and the standards to the altar rail are the work of Messrs. Powell and Sons, Whitefriars, London. The general work and the stone screen have been executed by Messrs. Bowdler and Co., builders, Shrewsbury, and the architect was Mr. A. E. Lloyd Oswell, A.R.I.B.A., of that town.

UPPER POPPLETON.—The new church at Upper Poppleton, near York, was opened on Monday week by the Archbishop of York. The old church, which was in the Norman style of architecture, was built between A.D. 1150 and 1155, but the new one, erected on the same site, is in the Decorated style. Mr. C. Hodgson Fowler, F.S.A., of Durham, is the architect. The new edifice, which will accommodate a little short of 200 people, consists of nave, chancel, organ chamber, and vestry. At the west end is an arcade of three arches, supporting a small bell tower, surmounted by a shingled spire. The roof is of open timber work, with plaster panels. The nave is seated with open seats, whilst in the chancel there are oak seats for choir and clergy. The pulpit, altar, and other fittings are likewise of oak. The contractors were Messrs. Hick and Hobson, of Little Stonegate, York, and the clerk of the works was Mr. George Clark. The cost has been £1,900.

WELLINGTON, SOMERSET.—A cottage hospital at Wellington will be opened on the 20th inst. by Mr. Lawson Tait. The building provides nine beds, and contains, on the ground floor, entrance halls, male ward 24ft. by 18ft., nurses' sitting-room and committee-room 14ft. by 12ft., operating-room 16ft. by 12ft., head nurse's bedroom, kitchen, lavatory, scullery, store, &c.; also a mortuary. On the upper floor are a female ward 24ft. by 18ft., isolating ward 13ft. by 13ft., convalescent ward 21ft. by 12ft., nurses' bedroom, bathroom, and lavatory. The contract has been carried out by Mr. Follett, builder, of Wellington, under the direct supervision of the architect, Mr. E. T. Howard, of Wellington.

A dispute at Stafford between the local Odd Fellows' Society, with respect to a new hall which it is proposed to erect in Greengate-street, in that town, from plans prepared by Mr. Wormald, and Mr. Hambleton, owner of the opposite property, has been arranged through the arbitration of the President of the Royal Institute of British Architects, Mr. J. Macvicar Anderson. Mr. Anderson assessed the injury to Mr. Hambleton's ancient lights, should Mr. Wormald's plans be carried out, at £300, and the Odd Fellows have decided to accept the alternative and reduce the proposed height of the hall. Each party has to defray the costs of the arbitration in equal proportions. In consequence of the decision arrived at there is a reduction of £170 in the amount of the contract. The work will be proceeded with at once, Mr. W. T. Woollams being the contractor.

Engineering Notes.

THE AVIEMORE LINE.—Traffic over the first section of the new through line from Aviemore to Inverness was in full operation on Monday. The line from the junction at Aviemore to Carrbridge, a distance of a little over seven miles, was officially inspected by Major Marindin in the end of last week, and the running of trains was at once sanctioned. This section of the line was commenced in February, 1890, by Messrs. John Ross and Son, Fearn, whose estimate was £27,773, the company supplying the permanent way and fencing the line. The contractors for the section of the line from Carrbridge to Culdoich, some five or six miles from Inverness, have large squads of men at work, and there is a prospect of the whole of the new through line being opened at an early date.

THE PALESTINE RAILWAY.—The British Consul at Jerusalem, in his last report, refers to the progress of the Palestine Railway, which has now been in course of construction for the last two years. The concession was granted by the Porte in 1888 to a French company, and the works, which were calculated to cost about £240,000 but which will probably exceed that sum, are being carried out by a firm of French engineers. A little over one-half of the line has now been constructed, and the remainder will be completed in September or October next. The line from Jaffa to the foot of the mountains is in a fairly good condition, but it has not yet been opened to traffic. The part to be finished is that which lies between the Jaffa plain and Jerusalem, and which will follow one of the valleys leading up towards Jerusalem from the south-west. The length of the whole line will be 54 miles, or 17 miles longer than the present carriage road. When the line is completed a branch will be made from Ramleh to Gaza, possibly with the object of forming a junction with the line from Egypt.

CHIPS.

The city council of Norwich received on Friday the resignation of his offices by Mr. Peter Paul Marshall, the city engineer, architect and surveyor. Mr. Marshall was appointed in 1877, having previously held the post of surveyor to the local board of Stone, North Kent.

The parish church of Tong, Salop, has been reopened after restoration from plans of Mr. Ewan Christian. The contractor was Mr. Bowdler, of Shrewsbury.

The work of pulling down the remaining block of buildings in Rolls-yard, Chancery-lane, lately occupied by the Official Referees, is now in progress, and building operations in connection with the erection of the remaining part of the new Record Office on the site, will forthwith be commenced. The old Rolls Chapel, founded about 1233, will be converted into a kind of museum. The comparatively modern Rolls House will not be pulled down for some five or six years to come.

At a meeting of the Liverpool Overhead Railway Company held on Tuesday, the chairman admitted that the progress of their undertaking had been much slower than had been anticipated, but expressed a belief that they would have the railway in operation in October. There were only 48 spans required to complete the main structure. The electric plant for the motive power and the carriages were complete, and they had their electric station at Wellington Dock well in hand; indeed, it was almost complete.

Over £200 has been subscribed to provide a memorial to the late Canon Burrows, of Rochester. It will take the form of a font for that cathedral, the design for which has been furnished by Mr. T. Barp, of Kennington, and the font is to be of Hopton Gate stone, the groups and figures around it of alabaster.

The opening of the inclined railway at Bridgenorth took place on Thursday, the 7th inst. It will remove to some extent the inconvenience of ascending or descending the 200 steps separating the high town and the low town. Mr. G. Croydon Marks, C.E., of Birmingham, is the engineer, and Mr. Law the contractor. The route adopted is from the bottom of the Stoneway Steps to the end of the Castle Walk. The length of the track is 201ft., and the vertical rise is 111ft.

The Gorse Hospital, New Swindon, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, and also by the patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL, XLI, XLVI, XLIX, L, LI, LIII, LIV, LVIII, LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. M. B. and Co.—B. L. and W. T. Co.—Chas. Francklyn.—Samscri.—F. G. R.—Geo. R.

Correspondence.

LAND SURVEYING.

To the Editor of the BUILDING NEWS.

SIR,—I fail to see how Mr. Cobham mends his position by his explanation in your last issue but one. I have always understood that the main line must be laid down first, and that in a four-sided figure the diagonal was the main line. Of course a man may put his horse in the shafts with his head to the splash-board, and drive the gig backwards if it please him; but his neighbours will take a lot of persuading that such a method of procedure is the correct one. Mr. Cobham either fails to understand my meaning, or ignores my point. DEF may be a check on the direction of BFA, but none on the length of FA, as the appended diagram will show, where

FA is 1,570 links in length, and FA 1,530 links (a common counting error, as Mr. Cobham may know), CA and CB being each the same length, yet BFC is so unchanged in direction that even on a scale of three chains the length DEF would not alter more than two or three links, an error which many an easy-going surveyor would

fail to detect, or would pass as "near enough," whereas my check, which ought to run from A to Y, and measure about 592 links, would run from A to Y, and measure only 567, a difference indicating beyond all doubt a considerable screw loose somewhere. Even were the line measured 1,670 links, that is a hundred links too long, DF would only vary five links, or thereabouts.

My construction, Mr. Cobham contends, has the same fault, and my BZ is left unchecked as much as his FA. Very well. I have shown him how a mis-measurement of 40 links in FA would fail to be detected by DF; will he show us by diagram, as I have done, how, keeping CD and DB the same length, it is possible to alter the length of BZ 40 links without the error being at once, and beyond all manner of doubt, detected by DZ, owing to the alteration in position of D? Such an error would, as a matter of fact, alter DZ from 827 links to 815.

As to my status, if my construction is faulty, incorrect, and misleading, not all the letters of the alphabet tacked on to my name can make it otherwise. The same remark applies to Mr. Cobham, and your readers must judge between us. As to my experience, if it has led me to adopt a better system than the one which contents Mr. Cobham, large or small, it will have been of more practical value to me than his has been to him.

Mr. Cobham takes exception to my condemnation of his other figures, and tries to throw dust in your readers' eyes by hinting that I condemn them merely because of a fault in Fig. 5. I did so because the fault is repeated in them. I will point out one instance. In Fig. 4, DB might be chained 30 links long or short without DE unmistakably showing the error—that is, without the direction of C.D.B. being altered more than a link or two. If Mr. Cobham cannot see any further instances in his diagrams, I am sorry for his capacity to learn correct surveying, if he will pardon my speaking so plainly.—I am, &c.,

NORTHMAN.

Intercommunication.

QUESTIONS.

[10807].—Stone Cornice.—Will some reader please inform me whether the following is the correct way of

measuring the labour to stone cornice and blocking course to a wall, say, 10ft. long, as shown in sketch?

ft. in.		Waste.
10 0		ft. in.
2 4		0 10
23 4	Labour plain face.	0 9
10 0		0 9
1 0	Do. plain weathering.	2 4
10 0		
1 6	Do. moulded face.	
	(Beds and joints not measured.)	

—QUANTITIES.

[10808].—Wood-Block Floors.—Can any reader say if pitch-pine blocks 1½ in. thick are reliable for a floor that is subject to considerable variations in temperature, or whether a different kind of wood is preferable?—ASHTON.

[10809].—Pitch Pine.—One authority says: "Pitch pine should not be used for timbering purposes where subjected to any great strain, nor in positions where it is not freely exposed to air." Another authority recommends (among other woods) pitch pine to be used for "great strength in construction." Will friends kindly give their early opinion on these two seemingly conflicting statements? Would there be any objection to the use of pitch pine for bressummers and story-posts to shop fronts? The bressummers would be in two halves, with iron or steel plate between, and both bressummers

and story-posts would be exposed, and painted or varnished.—J. H.

[10810].—**Drainage.**—I shall be glad of suggestions how to deal with the drainage of a hospital, no sewers being available for the sewage! The site is at an altitude to allow for the gravitation of sewage on to adjoining land.—ARCHITECT.

[10811].—**Paris.**—Can any reader of the "B. N." tell me what prospects there are in Paris for an architectural draughtsman (Englishman) who has just completed his articles with a well-known provincial architect? Also the names of the principal architectural papers published in Paris!—DATA.

[10812].—**Geometry.**—Will any of your numerous readers kindly tell me the books most suitable to study from for the honour, practical, plane, and solid geometry, with their prices and publishers? One of the books to be or include perspective.—GEOMETRIC.

[10813].—**Wood Block Flooring.**—I should be glad of information as to the composition of a good mastic for bedding wood block flooring on a large scale!—F. E. H.

[10814].—**Bricks.**—I would feel obliged to any reader for a reply stating a fair average number of bricks a bricklayer ought to lay in a day of 10 hours in the building of a cottage, whose external walls are 12in. thick, that is, two half-bricks tied together with iron ties, having an air-space of 3in. between. The partitions on the ground-floor are 4½in. thick. The bricks are laid in cement mortar, and the inside of the cottage is to be plastered.—BRICKLAYER.

[10815].—**Building Estate.**—Will some fellow reader say what the usual charge is for making plans for, and staking out, land in plots for building purposes, including setting out roads, &c.? In all, about 25 acres.—N.

[10816].—**Saloon Floor.**—Will some of your numerous and experienced readers give their opinions as to what is the most suitable wood for floor of dancing saloon!—EATON.

REPLIES.

[10800].—**Blackboard.**—Hawes' blackboard composition dries instantly and thoroughly hard, and can be applied by any inexperienced person. Shake the bottle well before removing the cork, pour out sufficient for your purpose, and apply with an ordinary paintbrush. It is prepared only by G. E. Hawes, school desk manufacturer, Duke's Palace Steam Joinery Works, Norwich.—G. E. H.

[10811].—**Wet in Coach-House.**—If lean-to roof has 16ft. span it should rise 10ft. 6in., and slates have a bond of 3in. pugged inside, to keep out wet.—J. G. GUY.

[10802].—**Cracking of Boiler Masonry.**—Pull out boiler fixings, and build up same in brickwork bonded together with layers of hoop-iron every four courses, interlaced at corners and angles.—J. G. GUY.

CHIPS.

A public meeting has been called for this (Friday) afternoon, at 4 o'clock, at 20, Hanover-square, by the permission of the Library Association, to consider the desirability of the formation of a society for the study of Bibliography, and the basis on which it should be established.

At the monthly meeting of the Rawdon local board, held on Tuesday week, a letter from the Local Government Board announced that the provisional order for carrying out a system of sewerage for the township had been sanctioned. Instructions were given to apply to the Local Government Board for a loan in order to carry out the work, under the superintendence of Mr. W. H. Radford, C.E., of Nottingham.

From a report just issued it appears that the total cost of the Glasgow municipal buildings, of which Mr. William Young was the architect, was £529,909 7s. 8d. The marble work of the banquetting hall staircase costs £10,590 0s. 2d., the council-chamber staircase £5,640 8s. 10d., the electric installation £2,209 12s. 8d., the electric and gas light fitting £4,008 7s. 8d., the painting and decorating work £3,750 5s. 3d. The internal finishings of the council-chamber have cost £4,378 8s. 3d., those of the satinwood salon £2,155 6s. 2d., and those of the octagon salon and crush salon £2,554 9s. 4d. The architect's, measurers', and inspectors' fees amount to £26,208 1s. 6d.

The village church of St. Mary, at Dallington, Northants, has received an addition to its reredos in the shape of a sculptured statue of St. James the Great. The reredos was erected when the church was restored in 1883 under Mr. E. Law, of Northampton, and the statue is from a design by the same architect. The figure in question stands upon a Caen stone corbel, and represents St. James the Great. It was executed by Mr. Harry Hems, of Exeter.

On Thursday in last week the marriage took place at St. Paul's, Tupsley, of Mr. G. H. Godsell, architect, of Hereford, and Miss Annie Cheiaka, youngest daughter of Mr. Cheiaka, the late county surveyor for Herefordshire.

On Saturday, the new district church of St. Columba, in the parish of St. Mary's, Gateshead, was opened by the Bishop of Durham. The church, which has sitting accommodation for between 400 and 500, is situated at the corner of Peterbrough-street, Gateshead.

Legal.

THE FINALITY OF ARCHITECTS' CERTIFICATES.

THERE is no doubt that the clause in building contracts as to the finality of architects' certificates has become more and more stringent. But there is a great deal to be said in favour of this stringency, as was very plainly pointed out by Mr. Justice Chitty in the recent case of "Tullis v. Jackson and Others," which no doubt is reported elsewhere in this journal. There the clause provided that the architect's final certificate should be binding notwithstanding any charge of fraud or otherwise. The plaintiffs as contractors claimed more than had been certified, and brought their action against the defendants as building owners. Being met with the plea that the architect's certificate was a condition precedent to their claim, they sought to upset this clause in the contract on the ground that it was void because it amounted to an agreement not to set up a charge of fraud as a ground of defence, and so was contrary to public policy. But there was no fraud charged by the contractors against their employers, the point of their case being that the architect had acted *bonâ fide*, and had certified for a smaller sum than was really due for the purpose of keeping back a larger balance, out of which he could get payment of a sum owing to himself, an allegation that was wholly denied and repudiated by the architect in question.

The principle of the Judge's decision was that there is nothing to prevent parties competent to contract from agreeing with each other that an architect's certificate shall be final and binding in all events and contingencies, so as even to cover charges of fraud. There is no reason why they should not shut out all chances of dispute by declaring that nothing shall be raised against it, and that it shall not be questioned even in a case of fraud. There is no doubt that contractors do sign contracts which to lawyers look terrific, and which seem to place them entirely in the hands of the certifying architect. But then they generally know with whom they are acting, and they rely upon his treating them fairly. Building contracts do raise so many and such complicated questions that, if litigation is to be rendered impossible, this clause must be very stringent and conclusive. It seems now to be established that such a clause can be upheld even though it makes an architect's certificate a bar to a charge of fraud, provided that this fraud is not in the contract itself or in one of the actual parties.

FRED WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning to insure answer same week.

VERITAS.—ROAD.—PLAN.—If, in fact, the road is not wide enough to comply with the regulations, it would be open to the Local Board to say that the plans were passed under a mistake, and it would be a very difficult thing to force them to take the road over. It is not easy to see any ground of action upon the other point named.

LESSEE.—REPAIRS.—COVENANT.—Even the strong covenant to deliver up premises in "good tenantable repair" must be construed by the light of the facts affecting the property. The Court will therefore consider the age, class, condition, and locality of the house in question, and it is only necessary that the lessee should deliver it up at the end of his term in a fair and tenantable condition, considering the circumstances of the whole case.

LEGAL INTELLIGENCE.

MAIDENHEAD.—An important arbitration case has just been concluded by the publication of the umpire's award. Under section 155 of the Public Health Act, 1875, the Corporation decided to set back the building line of some buildings to be erected by the owner of the land, Mr. A. E. Preece, of Maidenhead. A dispute arising upon the question of the amount of compensation to be paid to Mr. Preece as provided for under this Act, the whole matter was referred by the Local Government Board to Mr. Edward Pritchard, M.Inst.C.E., of London and Birmingham, whose award provides that the Corporation shall pay the sum of £507 to Mr. Preece, as well as the costs incurred in the arbitration proceedings and of the award.

THE BINDING CHARACTER OF ARCHITECTS' CERTIFICATES.—TULLIS v. JACKSON AND OTHERS.—This action, heard in the Chancery Division on Friday, before Mr. Justice Chitty, turned on the point as to the validity of a clause in a building contract making the architect's certificate binding and final, even although attacked on the ground of

fraud. The plaintiffs were the contractors for the greater part of the Free Public Library, Preston, erected out of moneys bequeathed by the late Mr. E. R. Harris, and the defendants were the committee appointed to carry out the scheme. The plaintiffs also joined the architect, Mr. James Hibbert, as co-defendant. The plaintiffs claimed to be entitled to some £56,550 for work done, and had been paid some £53,100. They now claimed payment of the balance—namely, some £3,450, for which sum, however, at the date of the commencement of the action, the architect had not certified. The plaintiff alleged that the architect (as the committee well knew) had not *bonâ fide* certified the amount due to the plaintiffs, but had knowingly certified for a smaller sum than was in fact due to the plaintiffs in order to leave a larger sum available for payment of a sum claimed by the architect. Since the commencement of the action a certificate had been made for about half of the sum claimed. The committee denied that they had the knowledge imputed to them, and pleaded that the architect's certificate was a condition precedent to payment. The plaintiffs at the Bar withdrew *in toto* the charge they had made against the committee. The architect denied and repudiated the plaintiffs' allegation. Mr. Justice Chitty, in giving judgment, said that the trustees were not charged with, and had not been guilty of, any fraud. It was said that the latter part of clause 31, which provided that the architect's certificate was void on the ground of public policy, should not be set aside, or be attempted to be set aside, by reason or on account of any technical or legal defects therein or in the contract, or on account of any informality, omission, or delay, or error in or under the proceedings, or any of them, or in relation thereto, or on any other ground, or for any other reason, "or for any pretence, suggestion, charge, or insinuation of fraud, collusion, or confederacy." It was said that clause 31 was void as being against public policy, because it was in substance an agreement on the part of the defendants not to set up fraud. To some portions of this argument he acceded. If a contract was obtained by fraud, and in the contract itself there was the term inserted that neither party should impeach the contract on the ground of fraud, it might be that such a term would not stand, and the reason was obvious. But the actual case he had to deal with appeared to him to be an entirely different one. Those who had been in the habit of framing clauses of the kind now in question had kept on making such clauses more and more stiff with a view to avoid the consequences of having the certificate opened. Amongst such consequences were the enormous cost and litigation which must arise from any Court of justice endeavouring to take the account—an account of thousands and thousands of items, on every one of which the skilful advisers might raise some definite issue whether the amount should stand for the sum charged or for some less or greater sum. Those who dealt with contracts like the present were, therefore, wise in making the clauses in the respect referred to more and more stringent. It was for the contractor when he entered into a contract of this kind to consider whether he would accept it or not. Contractors, no doubt, did accept clauses which to a lawyer looked terrific; but they did it as business men—they did it for better or worse—and because they thought, on the whole, it was more likely than not that it would work out rightly, and that the architect or surveyor whose certificate they were content to take as final would act justly towards them. The policy of the law did not require that he should hold in this case that a clause like the present was void. To put an illustration. Say a gentleman, who was going to have a house built for him, said to the contractor:—"On this complex contract innumerable questions may arise in its performance; will you agree with me (for if you will agree with me, I will agree with you) that nothing on earth shall upset the certificate that is given?" Why was that unfair? He could see no reason why grown up men should not be allowed to contract in those terms. It was well known that persons would shrink very often from charges of fraud, and that those who were persistent would merely, by bringing charges, induce persons to come to terms of compromise. The clause in question was addressed to get rid of what the parties might consider evils. The clause, therefore, stood thus. The parties said in effect—"Both of us agree to the advantage or disadvantage of the arrangement; we both of us agree that every certificate given by the gentleman named shall stand firm and good, and shall not be questioned even for fraud." That that was the meaning of the clause he had no doubt. It had been argued that the word "charge" in the clause meant "unfounded charge." He could not accept that. To put in the clause "unfounded charge of fraud" was almost to put in nonsense. Protection against that which was unfounded, and, therefore, must fail, was not required. The sum of his judgment was that the parties meant what they had said, and that the term "charge" as used here was used deliberately, the parties saying: "We will have no question of this kind raised as against the certificate." It need

hardly be said that if the case had been that the committee themselves had been parties in any way to the fraud, the legal position would have been very different. The plaintiffs' action against the committee was not justified, and it was dismissed with costs. Nothing was claimed by the plaintiffs from the architect who was joined as defendant. The plaintiffs' allegation against him was inserted merely for the purpose of founding the relief claimed against the trustees. The case had been so shaped that the Court could not even enter upon the allegation as between the plaintiffs and him. The plaintiffs' action as against him was also dismissed with costs.

CENSURE ON A LOCAL AUTHORITY.—CUNLIFFE v. THE HAMPTON WICK LOCAL BOARD.—Mr. Ridley, Q.C., the referee before whom this action was tried, gave his judgment on Friday in last week on the claim made by the plaintiff, Mr. W. Cunliffe, the contractor for the sewerage works, and the counter claim made by the Hampton Wick local board. The official referees said the claim was for balance of an account certified for by the surveyor to the local board for Hampton Wick, and the defence generally was a counter-claim. Before going into the history of the case, he wished to state what his views were on the contract. It had been contended by defendants' counsel that the work was to be done to the satisfaction of the surveyor and consulting engineer. He read the contract, however, as meaning that the surveyor was the person controlling the final certificate, and he did not think either the contract or the specification intended to say that the approval of the consulting engineer as well as the surveyor was required in order to enable the contractor to recover. The claim of £637 13s. 7d. was reduced by the allowance of £10 odd and £5 10s., with respect to a railway arch, to £622 2s. 9d. subject to the counter-claim. He thought there was no defence to that except such as arose on the counter-claim. The certificate gave him a right to recover, final and absolute, subject to his liability under Section II., and if the local board could show that the contractor was liable under that clause they were entitled to recover on the counter-claim. Having reviewed the evidence, the official referee said he could not understand the position of the board on receipt of their surveyor's certificate as to the completion of the work. They had no right to treat that as a report and not as a certificate, and they had no right to refer the matter to the final decision of the consulting engineer. What right had anyone to suggest to the surveyor that he should withhold the certificate? Mr. Elsam had done his duty, and there was not a tittle of evidence to show that he had not done his duty and gone through every part of the work. On the 28th April Mr. Elsam's appointment was revoked. There was no allegation that he had neglected his duty, or that he was incompetent to fill the office, and it seemed to him that Mr. Elsam was dismissed because he signed that certificate. He did not see how anyone could come to any other conclusion, and if that was so it was a most improper thing to do, because it was done in order to set up a defence to the claim. It was stated that Mr. Elsam was discharged before the date of the certificate, but the certificate was given on the 6th April, and the appointment was revoked on the 28th. He was asked to withhold his certificate, and go into the matter, but he was dismissed before he had time to do so. That was not an example to be followed by anybody who wished to be fair and impartial. If there was any negligence or improper conduct, there was no foundation for what he said, but it appeared that the board had been guilty of a piece of injustice. With regard to the alleged defects, he should find that in neither case did they appear within the three months. He thought there was improper workmanship and materials in Vicarage-road, and he thought, as the contractor said, that the surveyor saw and passed it. With reference to Hampton Court-road, he thought the allegations were not proved. The result would be judgment for the plaintiff, Mr. Cunliffe, on the claim and on the counter-claim, which had not been made out. He also gave interest of four per cent. on the amount claimed from the date of the certificate. Costs for the plaintiff, Mr. Cunliffe, on both cases.

IS A MODEL WINDMILL A SKY SIGN?—THE LONDON COUNTY COUNCIL v. CARWARDINE.—This appeal was heard in the Queen's Bench Division by Justices Wright and Collins on Monday, the 11th inst. It was an appeal from a decision of Mr. Rose, a Metropolitan magistrate, and the question involved was the construction to be placed upon the Sky Signs Act. The defendants carried on business in the City-road, and had upon their premises a tower 50ft. high, a windmill, which ground meal, carried sacks of meal, and worked a dynamo. There was also upon the structure a trade inscription. The defendants were summoned for having a sky sign without the permission of the Council. The magistrate held that the structure was a windmill, and not a sky sign. We fully reported the case in our issue of March 18 last (p. 423, last volume). The Court, after some argument, said this decision was upon a question of fact only, and gave no ground of appeal; and they sent the case back to

him to state if there was really any question of law which he wished to raise for that Court.

IN RE C. S. WHITTINGHAM.—This debtor, Christopher Samuel Whittingham, of Daventry, contractor, came up for public examination last week at the Northampton County Court. His total liability was estimated at £2,040 8s. 8d., of which £1,870 8s. 8d. was due to unsecured creditors. The net assets were estimated at £726, leaving a deficiency of £1,143 8s. 8d. The debtor had made an offer of 7s. 6d. in the pound, which had been accepted by the creditors. The debtor was examined as to a contract with the Daventry Corporation, and the examination was closed.

LIABILITY FOR DESIGNS.—MAINZER AND KEMP-THORNE v. ELLIOTT AND CO.—On Thursday week this action was tried in the Manchester County-court. It appeared that Messrs. Elliott and Co. (Mr. Jacques trading as such), wrote the plaintiffs desiring that they should see him in Manchester with reference to the preparation of designs for marble mosaic pavements for the Palace of Varieties, Manchester. The plaintiffs called upon the defendant accordingly, and with his manager saw the architect. They told the defendant's manager that if they obtained the order they should require to be secured as to payment, and as the defendant informed plaintiffs that there would not be any difficulty on this score, they proceeded with the preparation of designs at his request. These, it is alleged, were submitted by defendant to the architect, and approved, and at this time defendant would not consent to giving security; but had the designs executed by another firm. The plaintiffs accordingly sued for cost of preparing designs, and expenses, and recovered £10 10s., and costs.

CROSS ACTIONS AS TO SEWAGE DISPOSAL.—HANWELL LOCAL BOARD v. WENHAM.—On Tuesday week an action was commenced in the Chancery Division before Mr. Justice Romer, in which the Hanwell Local Board sought to obtain an injunction against Mr. Augustus Wenham to restrain him from continuing the connection of a ditch on his land with the effluent pipe from the sewage works, which discharges into the river Brent; and also for an order restraining him from making any further connection with the pipe. In a counter-claim, Mr. Wenham sought to obtain from the local board compensation for injury to the crops on his farm, caused by the board's sewage percolating to his land, together with an injunction restraining the board from continuing the damage. The evidence adduced in the first case showed that notice was served on Mr. Wenham by the board to disconnect a pipe on his land adjoining the board's sewage farm with the Board's effluent pipe. He wrote to Mr. James, the clerk, that he had communicated with his landlord. Subsequently he disconnected the pipe under the direction of the board's surveyor, but this fact, through some misunderstanding, did not come to the knowledge of the clerk till after the issue of the writ. During the hearing of the defendant's case Mr. Justice Romer intimated that he did not desire to hear any more. Mr. Wenham had not proved to his satisfaction that he had sustained any damage. He had, however, given him a chance to prove his case by the cross-examination of witnesses on the other side, but the result was to make his case worse than before. Judgment would be for the board, with costs.

EMPLOYERS' LIABILITY ACT.—AN UNSATISFACTORY VERDICT SUSTAINED.—WOOTEN v. BENNETT.—In this appeal case heard in the Queen's Bench Division on May 11, before Justices Wright and Collins, the plaintiff was the widow of a plasterer who had been in the employment of the defendant, and was killed by the fall of a scaffold 9ft. high whilst pointing a cottage. The plaintiff sued in the Bradford County-court under the Employers' Liability Act for compensation for the loss of her husband, and recovered a verdict for £270. Mr. Kershaw, for the defendant, now moved that there should be judgment for the defendant, or a new trial. He said the scaffold consisted of a plank, one end of which rested upon a padlock, and the other upon a triangle which was suspended from a ladder. One of the uprights of the ladder had been broken and had afterwards been bound up. This ladder gave way and caused the accident. The scaffold was erected by the deceased, and he must have seen that the ladder was defective. It was now submitted that the only duty upon the employer was that he should keep proper material, which the defendant did, and that the duty upon the servant was to select proper material. Mr. Banks, for the plaintiff, argued that there was some evidence of negligence on the part of the defendant. Mr. Justice Wright said he could not but think the verdict unsatisfactory; but that was no ground for the interference of the Court. He thought there was some evidence that it was owing to the negligence of the defendant that the defect in the scaffold had not been remedied. The application was dismissed with costs.

Sir William Arroll, the Forth Bridge contractor, has failed by 197 votes to retain the seat in South Ayrshire for the Unionists.

WATER SUPPLY AND SANITARY MATTERS.

BOLTON.—For some time there has been a dispute between the Bolton Corporation and the Bolton Rural Sanitary Authority as to the alleged pollution of an extensive reservoir at Heaton, belonging to the corporation, and Colonel Hasted, R.E., held an inquiry on the subject on the 13th inst. Great interest was taken in the matter, as a large population is affected by the outcome of the investigation. The town clerk, Mr. R. G. Hinnell, said the Heaton Waterworks cost £68,000, and a large sum had been expended in improvements to get a better and purer supply. The reservoir was situated in the rural sanitary authority's district, and owing to the locality not being sufficiently sewered decayed vegetable matter and sewage from cottages and farms got into the reserve and made the water unfit for use. In consequence of the water being declared bad by the borough medical officer, 69 million gallons had been run to waste at one time. Outside districts supplied by the corporation complained of the quality of the water, and refused to pay their accounts. This was a very serious matter.—Mr. Simpson Cooper, clerk to the rural sanitary authority, said they had a prescriptive right to turn the sewage on the land, and it was also used for irrigation purposes by the farmers. It was not for the authority to lay the sewers as requested, but they relied on the visit of the inspector to the place to settle the matter.—A number of witnesses were called by both sides, and the inquiry was an exhaustive one.

CROMER.—The local waterworks company have for the past two years been sinking a second well about half a mile away from the town. The new well varies from 8ft. to 5ft. in diameter, and has been carried to a depth of 183ft. from the surface. The chalk was reached at a depth of 138ft. below the surface, and the well has been lined to a depth of 151ft. with brickwork and iron cylinders. The new borehole, which is 20in. in diameter, extends from the bottom of the well for a further depth of 40ft. The two headings, each 6ft. by 4ft., have been driven a distance of 100ft., one connecting the new well and the old borehole by means of which the town has hitherto been supplied. The well, with the headings, possesses a storage capacity of 25,000 gallons, and the total yield will be 200,000 gallons a day. A new set of pumps and engine has been erected, designed to lift 12,000 gallons per hour, and the system is now in duplicate. The water has been favourably reported on by Professor Frankland, F.R.S. The works have been carried out in the direction of Mr. J. C. Mellis, M.Inst.C.E., of London, and of Messrs. Thomas Tilley and Sons, of Walbrook, E.C. The pumps and machinery are by Messrs. Robert Warner and Sons, of Walton-on-the-Naze, while the buildings on the surface have been erected by Mr. John Newman, of Cromer.

LIVERPOOL.—The new Vyrnwy water supply to the city, carried out under the direction of Mr. G. F. Deacon, was formally inaugurated by the Duke of Connaught yesterday (Thursday). An accident which will involve much trouble and expense unfortunately took place on the works at Fiddler's Ferry, at the aqueduct crossing under the Mersey. A valve in a 24in. temporary main gave way, and the 12in. temporary pipe by which the city has hitherto been supplied, also burst. The new 42in. main is, however, intact.

A memorial has just been placed in the Toller Chapel at Kettering, to commemorate the late William Toller, for 64 years a teacher in the Sunday-school, and for 49 years a deacon of the chapel. It was executed in variegated alabaster with gilded lettering. Messrs. Harry Hems and Sons, of Exeter, have carried out the work.

On Saturday the Lord Provost of Aberdeen opened a granite bridge which has been erected across the Don at Persley, half-way between the industrial villages of Buxburn and Woodside. The bridge is of five spans, the three centre ones measuring 50ft. in width, and those which rest on the bank at each side 25ft.; the breadth is 32ft. and the approaches 20ft. Mr. P. M. Barnett, C.E., was the designer of the structure, the contractor being Mr. James Leith, Aberdeen.

An inquiry into the application by the Corporation of Luton for power to borrow money to carry out proposed alterations to the Waller-street Plait Hall was held on Wednesday week by Major-General C. Phipps Carey, one of the inspectors of the Local Government Board. To cover the expense of converting the hall, £3,700 is to be borrowed, and £550 additional for covering in the yard adjoining with the iron roof to be removed from the building itself. Mr. Roscoe, borough surveyor, and Mr. Cox, of Messrs. Cox and Marmon, of Liverpool, the architects whose plans have been accepted, exhibited and explained the designs, it being stated that for the alterations to the hall the tender of Mr. G. Smart had been accepted at £3,150.

Our Office Table.

At Tuesday's meeting of the London County Council, an important scheme for providing access to the southern end of the Tower Bridge was presented. The committee have experienced great difficulty in the preparation of a satisfactory scheme for this improvement, owing to the difficulty of striking a direct line. The Church of St. Mary Magdalen, a disused burial-ground now laid out as a recreation-ground, and extensive buildings, factories, and works lie in the track. They now propose to cut a street 60ft. wide from Tooley-street to the south-western end of the Bermondsey New Road, and so forming a new communication with the Old and the New Kent Roads. The cost of the improvement is set down at £423,000. The report will be considered at the next meeting of the County Council, on Tuesday.

The London County Council, at their meeting on Tuesday, also instructed the Building Act Committee to consider and report on the expediency and practicability of obtaining such an amendment of the Metropolitan Building Acts as to bring the railway stations in London and other exempted structures within the provisions of those Acts and the Metropolitan Management Acts. The Public Health Committee was authorised to attend a Local Government Board inquiry about to be held to investigate the proposed improvements at Moira-place and Plumbers'-place, Shoreditch, about to be dealt with as insanitary areas. A number of houses in the neighbourhood will be taken under the Artisans' Dwellings Acts, 1868 and 1882. The result of the arbitration appointed by the Home Secretary has been the decision that the Council has to pay one-half of the cost of dealing with the area.

In the proposed route from Holborn to the Strand recommended by the Improvements Committee of the L.C.C., a large central circus is to be made about half-way, at the junction of Kemble-street with the south side of Lincoln's Inn Fields, communicating with many important thoroughfares. White Hart-street and Black-moor-street will be widened, and form another westward spur, coming out in Catherine-street, opposite the side of the Gaiety Theatre. These widenings and the Strand terrace will create important frontages and architectural opportunities if no parsimonious spirit is allowed to enter. It is a pity Southampton-row could not be widened to take in Kingsgate-street and the block of intervening houses, so that the communication northwards may be extended at least as far as Theobald's-road.

Old Raleigh House, on Brixton Hill, is now so built round by new brick houses of the "jerry builder" style, that it cannot any longer be seen from the main road. Those who knew the old house surrounded by its ancestral trees will be surprised at the transformation. We are sorry to see that a very ordinary type of villa has been adopted for the main front facing the road. Red brick and tile roofs would have been infinitely more appropriate for the surroundings than white brick and slated roofs. An architectural character at least might have been given to the front row of detached villas.

A SERIES of eighteen portraits of the Cockburn, Lyttelton, and Hamilton families has just been added to the National Gallery under the bequest of Marianne Augusta, Lady Hamilton, and of these the most noteworthy is Lady Cockburn and her children, by Sir Joshua Reynolds, exhibited at the Academy in 1774 and engraved in 1793 under the title of "Cornelia and her Children" by C. Wilkins. The children were James, George, and William Cockburn, who succeeded in turn to the baronetcy as sixth, seventh, and eighth holders of the title. There are three other portraits of Sir James Cockburn, nby A. W. Devis, Zoffany, and by an unknown artist, and one of Admiral Sir George Cockburn, by J. J. Halls, among those just bequeathed to the Gallery. The collection is hung in rooms XVI., XVII., XVIII., and XIX., and the numbers range from 1,354 to 1,372.

UNDER the revised rules for the professional examinations of the Surveyors' Institution, all applications from candidates for the Professional Associateship or the Fellowship Examinations must reach the secretary of the Institution

before the end of the preceding month of October, instead of the end of the preceding month of November as under the old rules. It is also announced that the Division V. Examination of the Institution, which has been suspended for some years past, is now revived in a greatly modified form. Those whose qualifications fall within the conditions of entry for this Examination can, by means of it, qualify directly for the Fellowship of the Institution without passing a previous examination. A Direct Fellowship Examination will be held in March next contemporaneously with the other professional examinations.

THE most important public building destroyed by the disastrous fire which has laid the greater part of the city of St. John's, Newfoundland, in ruins is the Episcopal Cathedral, a building which has been some five-and-forty years in course of erection in sections. The original designs were prepared in 1847 by the late Sir Gilbert Scott, and the nave was then erected. For many years nothing further was attempted, but in 1880 Mr. Gilbert Scott was intrusted with the completion of his father's designs, with such modifications as he might judge desirable, and the choir and transepts were built by a body of masons sent out from England, the whole of the freestone being exported from the Giffnock Quarries, near Glasgow, although a local sandstone quarried near St. John's was utilised for the rubble walling. Before last Friday's fire the cathedral consisted of a nave with aisles of six bays, lighted by a single lancet-headed window in each bay of the aisle and clerestory, and a western narthex; projecting transepts, and a square-ended choir of four bays, this eastern work being of fully developed Decorated character, and provision was made for a future central tower 35ft. square, with broach spire. The styles were purely worked out, the whole effect was simple and bold, and general regret will be felt that so fine and substantial an example of a colonial building designed by English architects should have fallen a prey to the flames. Illustrations of the cathedral appeared in our issues of September 18 and October 30, 1885.

A ST. LOUIS man has recently invented a kiln for seasoning wood, which is a radical departure from the ordinary high temperature devices of the kind, the air at no time being higher than 100° F. With such a temperature, and a rapid circulation of air, it is claimed that green wood can be perfectly and rapidly seasoned, since the conditions are the same as those under which lumber is dried in the open air in summer. The kiln is built in separate compartments, with a heating coil under each which raises the temperature from 65° to 100°, the warmed air escaping from one end of the kiln through suitable openings. From the opposite end of the compartment the air is drawn out by a powerful fan. As provisions are made to prevent its passing over the pile, the air goes through the spaces left between the boards, and hence comes in contact with every part of the lumber. It is said that the wood rapidly matures under these conditions.

THE regulations of the examinations for sanitary inspectors, about to be held by the British Institute of Public Health, have just been issued. Two examinations, a preliminary and a technical, will take place each year in April and October. The preliminary examination will be on subjects of general education, and must be passed before the candidate can be admitted to the second or technical examination, unless satisfactory evidence be produced to the council of the candidate having passed an equivalent examination. The technical examination will be in so much of sanitary science as is comprised in the functions of a sanitary inspector, and will be written, oral, and practical. A candidate will be admitted to this examination on producing evidence (1) of being twenty-one years of age; (2) of having passed the preliminary or an equivalent examination; (3) of having received practical instruction in the subjects of the examination, of such a character as shall be deemed sufficient by the council, or of having held for at least one year the position of a sanitary inspector. Every candidate who has passed the technical examination to the satisfaction of the examiners will receive a certificate testifying to his knowledge of what is required for the duties of a sanitary inspector. The fee for the examinations is three guineas. Candidates intending to present themselves for either

examination must give fourteen days' notice in writing on forms, to be obtained on application to the secretary of the Institute, King's College, London. The examinations will be held on the first Wednesday, Thursday, and Friday in the months of April and October in each year. The next preliminary examination will be held in London on October 5th, and the technical examination on October 6th and 7th, 1892.

Trade News.

WAGES MOVEMENTS.

BRISTOL.—According to the *Bath Herald*, work is so brisk in Bristol with the building trade that there is a great demand for masons at 8d. per hour, and men are readily finding employment.

BOLTON.—The whole of the operatives in the Bolton and district building trade were locked out on Saturday in pursuance of a resolution passed by the Masters' Federation. The trouble has arisen through the plumbers and glaziers, who have been on strike for ten weeks, refusing to accept arbitration as a means of settling the dispute. Over 1,000 skilled workmen are affected.

CARDIFF.—Stonemasons, bricklayers, and labourers held a meeting at Cardiff on Monday, when it was resolved not to accept the offer of the master builders to resume work at 8½d. per hour. The masters have taken steps to bring in men from other places, and have given notice of their intention to the officials of several trade unions on strike.

NORTHAMPTON.—The strike among the bricklayers shows no signs of ending, and is involving the stoppage of the other building trades in the town.

CHIPS.

The ventilation of Glencue Academy is all being carried out by Messrs. Baird, Thompson, and Co., of London and Glasgow.

A new public hall has been erected at Harrow-road, W., and special attention has been paid to the ventilation, which is carried out on the Boyle system.

The Dover Harbour Board on Saturday accepted the tenders of Mr. John Jackson, of Victoria-street, Westminster, for upwards of £400,000 for the eastern arm of the new harbour at Dover. The work is to be commenced forthwith.

The Bishop of Chester, on Thursday last week, reopened the village church of Marbury, near Whitchurch, which has undergone restoration at a cost of £2,300. Messrs. Douglas and Fordham, of Chester, were the architects, and Mr. John Stringer, of Sandbach, was the contractor.

The new municipal buildings with which the citizens of Gloucester have provided themselves, and which will be known as the Guildhall, were formally opened on Tuesday. It was in 1887 decided to acquire the site of Sir Thomas Rich's School in Eastgate-street for the present building; but it was not until 1899 that Mr. G. H. Hunt, of London, was appointed architect, and Messrs. Bowers and Co., of Hereford, the builders. The selected design for the building, which, with site, has cost nearly £35,000, was illustrated in the *BUILDING NEWS* for July 26, 1889.

Foundation stones of a Wesleyan chapel were laid on Wednesday week at Church Fenton. The building, which is to be constructed from the plans of Mr. F. W. Dixon, architect, Oldham, is to cost about £1,150. It comprises a chapel, with accommodation for 200 persons; and a schoolroom for 140 scholars, which can, when requisite, be made into one. In addition, there will be two classrooms and vestry. The chief contractors are—masons' work, Messrs. Thompson and Son, Sherburn and Leeds; and joiners' work, Messrs. Atkinson and Sons, Leeds.

A stone reredos has just been erected in St. James's church, Higher Broughton, Manchester, in memory of the late Dr. Theodore Drayton Grimké. The side and east walls of the chancel have also been decorated in oil, the design being the Rose of Sharon, treated conventionally by Mr. R. Bennett, of South King-street, Manchester. The reredos has been executed by Messrs. Earp and Hobbs, of Lower Mosley-street, in that city, from the designs and under the superintendence of Mr. R. Price, also of Manchester. The reredos was unveiled on Sunday last.

On page 58 of our issue for July 8th, 1892, in a notice of the dedication of the restored belfry, new bells, and rood-screen at St. Peter's Church, Bexhill-on-Sea, the name of the architect appears as Mr. Thomas Parratt. It should have been Mr. Thos. Garratt, and we are informed that the chancel screen is the work for which that gentleman is responsible. Other fittings from his designs are now in hand.

Holloway's Pills never cause pain or irritate the most sensitive nerves or most tender bowels. Holloway's Pills are the best known purifiers of the blood, the most active promoters of absorption and secretion, whereby all poisonous and obnoxious particles are removed from both solids and fluids.

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. **VERY HARD, and NEVER WEARS SLIPPERY.**

SOLE AGENTS for England,

J. & A. CREW, Cumberland Market, London, N.W.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone on these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to **CHARLES TRASK and SONS**, Doulting, Shepton Mallet, Somerset. London Agent:—**Mr. E. A. WILLIAMS**, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colours of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

THE HAM HILL STONE COMPANY

NORTON, STOKES-UNDER-HAM, SOMERSET.

London Agent:—

Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building, Estates and General Plan Work at very reduced prices.—**T. PETTITT and CO.**, Lithographers, 28, Frith-street, Soho, London, W. Established 50 years

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT,
TEAK, VENEER, and FANCYWOOD
MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BARNET.—For alterations and additions to Barnet Town Hall. **Mr. J. White, Barnet, architect:—**

Marriott ...	£350 0 0
Anstew ...	326 0 0
Hughes ...	297 0 0
Houghton and Son ...	293 0 0
Allen and Son ...	218 0 0

BARNSELY.—For street-making, for the town council. Accepted tenders:—

Cresswell-street:—	
Hood, J. ...	£715 0 0
James-street:—	
Higham and Porter ...	498 13 0
Upper Sykes-street:—	
Burrows, H. ...	189 15 0
Victoria-street:—	
Taylor, J. C. T. ...	287 0 0
Upper Silver-street:—	
Bycraft, E. ...	450 0 0

BARRY, NEAR CARDIFF.—For the erection of five villas and two cottages, Porthkerry-road, Barry. **Mr. W. H. Watling, Council Chambers, Newport, and Cardiff, architect:—**

Jenkins and Arnold, Barry (accepted) ... £2,865

BARRY, NEAR CARDIFF.—For the erection of three shops at Barry Dock road, Barry. **Mr. W. H. Watling, Council Chambers, Newport, and Cardiff, architect:—**

Jenkins and Arnold, Barry (accepted) £2,908

BECCLES.—For building new granary warehouse and engine-room for Mr. H. L. Robins, coal merchant. The bricks found by proprietor. **Mr. Arthur Pells, F.S.I., surveyor:—**

Allen, F. J. ...	£390 5 0
Hindes, E. W. ...	304 0 0
Calver ...	290 0 0
Dunn ...	275 10 0

All of Beccles.

BERMONDSEY.—For the erection of a dispensary in Abbey-street, Bermondsey, for the guardians of the poor of the St. Olave's Union. Messrs. Newman and Newman, 31, Tooley-street, London Bridge, architects. Quantities by Mr. W. T. Farthing:—

Bentley, J. ...	£2,837 0
Coxhead, M. ...	2,677 0 0
Castle, W. and H. ...	2,639 0 0
Kellett, A. ...	2,676 0 0
Bullers, J. ...	2,585 0 0
Wells, W. ...	2,583 0 0
Faulkner, H. ...	2,498 0 0
Richardson, J. O. ...	2,460 0 0
Hall, T. ...	2,358 13 0
Cousell Bros. ...	2,342 0 0
Balaam Bros. (accepted) ...	2,279 0 0

BRIGHTON.—For erection of public elementary schools at Stanford-road, Brighton, for the Brighton and Preston School Board, U.D. **Mr. Thomas Simpson, 16, Ship-street, Brighton, and Mr. John W. Simpson, 10, New Inn, Strand, W.C., joint architects:—**

Mid-Kent Building Co. ...	£14,310 0 0
Freeman, V. P., Brighton ...	13,990 0 0
Holloway Bros. ...	13,814 0 0
Kilby and Gayford ...	13,781 0 0
King ...	13,695 0 0
Peters, Horsham ...	13,605 0 0
Johnson and Co. ...	13,532 0 0
Simpson and Co. ...	13,378 0 0
Chappell ...	13,132 0 0
Taylor, Brighton ...	13,023 0 0
Longley and Co., Crawley ...	12,541 0 0
Taylor Bros., Hastings (accepted) ...	12,207 10 10
(Rest of London.)	

BRISTOL.—For the construction of boundary walls and the fixing of iron railings at the public park:—

Wilkins, G. H., Bristol (accepted) £1,341 14 5

BURGH-HEATH.—For the erection of two blocks of four cottages each at Burgh-Heath, near Epsom, Surrey, for Mr. Charles Beall. **Mr. F. J. Dibble, Docking, architect:—**

Wells, W. J., Kingswood, Reigate ...	£1,692 0 0
Potter, J. B., Sutton ...	1,400 0 0
Peters, R., Banstead (accepted) ...	1,317 10 0

CARDIFF.—For converting three houses, Nos. 210, 212, and 214, Cowbridge-road, Cardiff, in shops and dwelling houses, for the Newport Property Investment Co. **Mr. W. H. Watling, Council Chambers, Newport, and at Cardiff, architect:—**

Hopkins, J., Cardiff ...	£83 0 0
Lock, C., Newport ...	180 0 0
Richards, E. ...	179 0 0
Price, W. ...	185 0 0
Ashley, E. W., Cowbridge-road, Cardiff (accepted) ...	159 0 0

CHICHESTER.—For the erection of a police station at Chichester, for the Receiver for the Metropolitan Police District. **Mr. John Butler, F.R.I.B.A., architect. Quantities by Mr. W. H. Thurgood:—**

Graham and Co. ...	£3,993 0 0
Naylor and Son ...	3,887 0 0
Calland ...	3,848 0 0
Wallis ...	3,740 0 0
Higgs and Hill ...	3,684 0 0
Chappel ...	3,677 0 0
Grover ...	3,657 0 0
Gardener ...	3,650 0 0
Hart Bros. ...	3,645 0 0
Knight ...	3,629 0 0
Lathey Bros. ...	3,540 0 0
Avard ...	3,500 0 0
Wiltshire, jun. ...	3,494 0 0

ZINC AND COPPER ROOFING

(UPON OUR PATENT SYSTEM)

WITHOUT SOLDER OR EXTERNAL FASTENINGS

FULL PARTICULARS, MODELS, &c., UPON APPLICATION.

HOLDEN & CO., 5, WOOD STREET, WESTMINSTER, LONDON.

TWELVE GOLD AND SILVER MEDALS AWARDED.

ZINC ROOFING.

F. BRABY & CO., L^D.

VIEILLE MONTAGNE SOLE MANUFACTURING AGENTS.

NO SOLDER.

NO EXTERNAL FASTENINGS.

WHICH WAY TO STEER.

THE course of an enduring profession like ours, as it passes on through successive generations, should be, not a helpless drifting, but a skilful steering. The question is, What points are we to make for—what direction are we to take? In the history of a nation there are moments like the present, when such an inquiry comes to everyone, and when everyone has to answer it with such faculty as he possesses. In the history of a profession it is not so. An architect, for instance, may go on from youth to old age, minding his own personal affairs, and nothing beyond them. The relations of architects to the public and to the art they practise may be quite outside the limits of his thought; yet if these relations grow worse instead of better, he can hardly fail to suffer, although, like the Parliament which Guy Fawkes proposed to annihilate, he "may not see what hurts him."

First of all, if the architectural profession is to become more useful and more respected, it must steer in the direction of improved early training. Something has already been accomplished here, but much more remains to be done. Architects still in the prime of life remember and regret the wasted years of their long articleships. The pupil entered an office, perhaps, at fifteen. For the first twelvemonth he was taught how to strain drawing-paper, and how to clean the boards on which it had been glued down; how to rub-up Indian ink, and, on occasion, how to light the office fire. These are useful—nay, almost indispensable—accomplishments; but with ordinary capacity they can be acquired in a week. The second year was spent in tracing, and perhaps the third and fourth likewise. Explanation of drawings were seldom given, even in reply to questions. A diligent youth by keeping his wits about him could pick up a good deal, but if he were not diligent he learned nothing except the management of pens and compasses. Finally, in the fifth year, he would be allowed to visit buildings in progress. Amongst these he might idle about all day, or he might fit himself for future success, and then he was shaken off, to sink or swim as it happened. At the present time a five years' articleship is rare. Pupils and their parents think three years quite enough. Now where little is taught beyond paper straining and tracing, even three years are too much; but three years, although well spent, will seldom fit a young man for any appointment to which a salary is attached. The consequence is that the profession is crowded with imperfectly-trained junior assistants, while really competent men are as scarce as ever.

A great improvement on the present plan would consist in spending three years in an architect's office, learning drawing, construction, and architecture proper, and then two years in elementary work at the various handicrafts. The young architect should make, with his own hands, the joints in a roof; he should work at framing and panelling, and learn experimentally the differences between good timber and bad, and between one sort of wood and another. He should be able to make up mortar, cement, and plaster, to build walls of different thicknesses in different kinds of bond, and to point them in various styles. In masonry, he should at least work plain and tooled faces in half a dozen sorts of stone, and should be thoroughly well acquainted

with the bed in every one. In modelling and plastering he might go further, and use his artistic powers in producing ornament. He should do at least as much practical plumbing as would enable him to solder a pipe and to lay a lead gutter; he should do enough pattern glazing to impress on him the conditions under which it ought to be designed; and enough light blacksmith's work to make him understand welds and scrollwork. After such a training he would return to an office a really valuable man—capable of superintending buildings, and having something like a clear idea of the principles on which details ought to be designed. But he would have to work at his handicrafts, and not to play at them, which is just the point where architectural students, who enter a builder's workshop for practice, commonly fail.

The fact is, a builder's workshop is not the right place for such a training as the architectural student needs. What a builder aims at is, very naturally and properly, to get his own work done. An apprentice learning the mere rudiments of a trade, and never likely to grow into an accomplished workman, is simply a nuisance to him. At best he can only give such a student the run of his premises, and let him improve himself as he may by seeing what happens to be there at the moment. This, perhaps, is not at all what the student wants to learn. Probably it is too far advanced for him, or not of the right sort in some other way. He needs rather to go to a place where he will get progressive training, from the very simplest to the more advanced kinds of workmanship, where the work will be adapted to his capabilities of doing it, and where he will be led steadily on from one stage to another. He wants, in short, to go to a thorough technical training school specially meant and fitted for the turning out of architects. Whether, amongst all the technical schools lately begun or proposed, there is just such a school as this, we do not know. If there is, every young architect ought to be informed of it. If there is not, the professional societies, and even the Royal Academy itself, might do much worse things than to begin it. In time it might grow into a real school of art—a force that would influence for good every British craft and manufacture. Pupils passing through it might, some of them, find that they had skill and invention which would help them on in the subsidiary arts more rapidly than in architecture itself. This would be a gain in many ways. The architectural profession would be less crowded, the arts which are allied to architecture would receive the improvement they need, and architecture would consequently be more and more ready to make use of their help. Yet no technical school, by itself, will make an architect. Office training will still remain a necessity. Scale-drawing and perspective drawing will always have to be learned. Construction, in the larger sense, is beyond the grasp of the technical school. Planning, on which an architect's success so much depends, belongs to quite another province; and so, in the main, does architectural composition. All these, and a hundred other things, can best be learnt in an office; but the man who has learned them would use them with double power if he also had the faculty which comes from practical acquaintance with materials and labour. So far, there is reason in the contention of the arts and crafts architect, and, so far, he ought to be heartily supported.

The next point to steer for is the requirement of a certain standard of professional knowledge from every man who aspires to be an architect. Here there are two alternative ways. Suppose that an examination is agreed on, comprising the matters which it is indispensable for practising architects to know. Is everybody who passes it to be

thenceforth acknowledged as an architect and admitted to membership? This is, practically, the view which the Institute has lately taken of the matter. It has been almost a thing of course that everyone of good character who could pass the examination should very shortly after be elected as an Associate. The results, in some cases, have been singular. Many people have a faculty for passing examinations who seem to have no other faculty whatever. The most incompetent of assistants—the most helpless among clerks of works—have qualified themselves in this way, and thereafter have never ceased to sign themselves Ass.R.I.B.A. Of course, some of the ablest of our rising men are also amongst the Associates of the Institute; but they can hardly care to march through Coventry with such companions as these. The net result of the system is that the title amounts to nothing. It may belong to an architect of the highest promise or to a sham architect who ought never to have entered the profession.

An architect is, or ought to be, a man who can produce architecture. If he cannot produce it, the title of architect should not be conferred on him. Let him, by all means, have credit for what he knows; but do not give him a name to which he has no right. If he passes in theoretical construction, let him have a certificate for theoretical construction; if he passes in surveying, let him have a certificate for surveying. Let justice be done to him, and let the path be open by which he may attain the higher rank when he deserves it. No amount of success in examinations will make the pupil at a naval school into a captain, or even into a first lieutenant. He must pass his examinations. It is true, before he will get the chance of becoming either; but to become either he must also have prolonged practical experience, and show considerable practical ability. So it should be with architects. The examination should be an indispensable preliminary. There should (when the system has once got into fair working order) be no admission without it. But it should not be valued at more than its worth. It should not be supposed to prove that a candidate who can answer questions about the strength of materials and about similar subjects is able to plan, design, and construct a satisfactory building. It proves nothing of the kind; but it is just this that needs proving before a man is entitled to be described as an architect.

This, of course, has a bearing on the question of registration. The great objection on the part of those who oppose it seems to be its supposed tendency to put all who are registered as architects on the same level. Mr. Compo, it is said, who failed two or three times as a jerry builder, and ultimately developed into a jerry architect, will, if registered, be looked upon by the public as the equal of Mr. Waterhouse, Mr. Pearson, or any other architectural member of the Royal Academy. This, of course, is exaggeration. See how registration works in another profession. In the main, the public thinks that the doctor is a doctor, and that one doctor is about as good as another. There it is wrong; but it does have the sense to realise that for certain diseases certain medical men are immeasurably superior to others. It consults them under enormous difficulties as to the distance and expense, and pays them for their time at something like a guinea a minute. So far registration has not put all members of the medical profession on one level. But it has put a great many of them there, and has lumped together scores of the skilful with hundreds of the unskilful. It is the prospect of a similar lumping together in our profession, which has made the idea of a uniform registration so distasteful to many able men. But is it not possible to make the passing of an examination legally indispens-

able, without at the same time allowing it by itself to confer the title of architect? Why not adopt an examination on the lines of the naval, rather than of the medical one—an examination without passing which there is no entrance to the profession, but after passing which the candidate must show his abilities in more practical ways before he is put into any post of high responsibility.

The last point to steer for which we can refer to to-day is that of a better system of remunerating professional services. Here, even as matters now stand, all architects are on a level. With the rarest exceptions, none of them value their work at more than 5 per cent. on the cost of their buildings, and yet the real differences in value are enormous. Except in the case of very large or excessively plain structures, 5 per cent. is about as low a charge as it is possible to make and live. There is no adjusting matters, therefore, by keeping this as the payment of the most accomplished men, and by giving the less and less able proportionately lower fees. It is very difficult to make a change without changing for the worse; and probably registration, in some form, must be effected before any real improvement will be possible. Yet improvement here is a main point to steer for. Payment by commission looks dubious, if it is not actually so. An architect seldom goes into court without being told that this form of remuneration cannot be enforced unless there has been a previous agreement to it. What it means is, that the ablest architect shall get no more for a given amount of labour than the feeblest one; and what it results in, therefore, is that clever men, instead of charging more for their work than others, can only increase their incomes by taking more work than they can properly do. Thus the country does not get their best out of its best men. Architectural pot-boilers and architectural masterpieces are both paid for at the same rate, and the wonder is, therefore, that our cities do not consist entirely of the first, without even an occasional approach to the second.

THE BLOCK AND QUADRANGLE.

IN these days of densely-packed areas and concentrated building it becomes of great importance to make the most of the space at our disposal. How we ought to dispose our buildings for domestic and public purposes is one of those questions about which promoters, owners of property, and architects are not very decided. The idea is that if we cover the land with building and increase the number of stories we utilise the space to the best advantage. Little argument is required to prove that this plan deprives the building of two great necessities, light and air, both of which must be derived over or through surrounding premises. The greater the space covered within the given boundaries, and the higher the building, the greater is the need of area for necessary light and ventilation, or, as it practically works out, the less habitable and healthy it becomes. In a deep, solid building light can only be admitted through the four sides, therefore the inner rooms and corridors suffer from deprivation of light if sufficient interior light areas are not provided. Every architect who has designed a large solid block of dwellings or offices in flats is aware of this difficulty. See, for example, how many large blocks of offices and residences in Victoria-street, Broad-street, Chancery-lane, and other City streets are spoilt by the darkness of the interior rooms deriving their light and ventilation from small areas of considerable height which have the appearance of shafts. Even as offices these inner rooms are too dark and dismal to work in without gaslight, the requirement of which adds much to the rental paid for the flat or suites of rooms. The isolated block is of course

less objectionable than the solid engaged block in a street. We mean one with an open space all round, but even the isolated building may lose its advantages by being carried several stories, as a hospital pavilion may suffer if it exceeds in height the space between it and the adjoining pavilions. The "block" system is seen in its full development in the lofty tenement-house of New York or Chicago, or in this country in the monster hotel or block of flats, and in these the system reaches its culminating point of mischief. The floors are ventilated from one to the other, the lifts and staircases serve to conduct the air and to render it impossible to preserve that hygienic condition of purity which is absolutely essential, besides implicating the whole block of floors in case of fire. A paper read at the late Health Congress went to show, from carefully prepared statistics, that the mortality of hotel servants was higher than that of any other class, owing mainly to the impure air breathed in the dormitories at the top of the hotel. What are we to think of such immense blocks as those of the Masonic Temple, the "Manhattan," the Auditorium, and the Title and Trust Buildings of Chicago, with their numerous stories? Some may naturally ask whether these buildings are legitimate architecture, or are not merely *tours de force* of a very vulgar order. Many of them are huge blocks of offices packed on each floor with rooms lighted partly by side courts. Architecturally we are ready to admit that some of them exhibit considerable skill in the attempt to give expression to vertical masses of numerous windows, and in the bold treatment of the lower granite or rusticated basements; they overwhelm and impress the eye by the great mass of superimposed stories, but we cannot affirm that their merits are equal to the effort and cost. As the solution of a hygienic problem, we certainly consider these buildings huge blunders, occupying space and blotting out sunlight, for which they give no compensation. In the event of any epidemic or fire breaking out, the consequence to those living on the various floors is simply disastrous. We might go on enumerating objections to the "block" system of building; one of the greatest is the crowding on a small area of a larger number of human beings than is desirable or safe. A well-known hygienist, Dr. Poore, of University College, lately said, "The fashion of piling people in heaps, and offering libraries and bagatelle-tables as a compensation for a garden, must come to an end." Another is the friction of so large a number of people in one block through the want of more entrances.

But the æsthetic reasons to urge against the "block" system are quite as strong as the hygienic, and it is almost needless here to say anything on this ground. Our great blocks of buildings in London are disfigurements. Northumberland-avenue has well been called a "draughty, gloomy gorge of bricks." The monster blocks and residential flats in the West-end are painfully dismal, destroying that personal liberty which is more than ever necessary in residence in great cities. And as every architect is aware, all idea of proportion is destroyed by a huge façade, which cannot be properly viewed from any point within the confines of an ordinary street.

Let us now turn from the "block" to the quadrangular disposition of buildings, and let us see how it may give advantages most needed in town life. By the quadrangular system we mean building round a square or courtyard, or placing the blocks in such a manner that sunlight and air can penetrate the innermost rooms and infuse life and cheerfulness to the inmates. We cannot in our cities obtain large quadrangles or grass-plots like we see in Oxford and Cambridge, and which impart

such a picturesque charm to those University towns; but we may at least try to plan our large buildings for offices and residential purposes with more reference to the area at our disposal. For instance, it may sometimes be advisable to build two or more blocks instead of only one, separating them by courts. If the ground is wide enough we may put a longitudinal building down the centre, with one or two cross blocks, which would give four or six courts; the two front ones near the street could be planted, immensely enhancing the frontage, the remaining courts behind affording light and air to the inner blocks. These areas, by reducing the depth of each block, render it easy to light the several apartments and corridors, promote cross ventilation, and simplify the roofing. The narrow-fronted building to a street, with a considerable depth, is always a nut to crack, especially if it has to be built solid. Without a central area, the lighting of the middle rooms is impossible. Is it absolutely necessary to build it solid? May it not rather be planned to inclose an area on one side? An area in the centre would, of course, be impossible in a long narrow site. Suppose we make the front and the rear parts return the whole width, leaving a long building connecting them with a side area. The shape of block would be a long  (looking at the plan sideways); the area thus left would give light to all the rooms between the two return ends, and such a plan would admit of a side façade as well as a front.

Examples of buildings inclosing courtyards may be seen at the Bank of England and Royal Exchange, St. Bartholomew's Hospital, Courts of Justice, Gray's Inn, New Inn, Somerset House, Government Offices, Whitehall, Burlington House, Buckingham Palace, and several other public buildings in London. The beauty and variety of those edifices are derived from this source of effect. Mr. Waterhouse, in the Manchester Town Hall, has disposed his blocks round a triangular area, in which the central hall is placed. The main corridors surrounding the building internally receive their light from the area, and are made to contribute to internal picturesqueness. The Municipal Buildings at Bury and Sheffield are planned with open courts, the office blocks arranged round the triangular and irregular sites. The open court may sometimes become a central hall. The quadrangular courts and halls of the lately selected South Kensington Museum extension design exhibit this idea, and the design selected for the Glasgow Art Galleries, which we have lately illustrated by plan and elevation, is instructive as an example of a long rectangle having a large central hall placed transversely with a court on each side. As will be seen in these latter instances, a great public hall may sometimes take the place of an open quadrangle round which the solid blocks are grouped.

The quadrangles of Oxford impart to that city all its character, and distinguish it from the modern town of to-day. Who has not admired the quadrangles and surrounding buildings of Merton, Magdalen, and Christ Church, the gateway and quadrangle of Brasenose, and the cloister and domestic charm of Magdalen? We cannot hope or expect to build now these beautiful retreats, removed from the noise and bustle of town life; even such secluded courts and inclosed gardens as those of Garden-court and Pump-court in the Temple, or the pleasant squares of Staple Inn and Gray's Inn, of Bloomsbury and the West End, are not likely to be repeated, owing to the increasing value of land in London; still there are opportunities offered by the demolition of large building areas, which would enable the owners of ground and the London County Council to avail themselves of planting squares and small inclosed gardens, instead of allowing them to be occupied by solid blocks. If an area

in the rear of houses can be obtained, it would be conferring a greater boon on the public to lay it out as a square or garden court, to which the surrounding houses can have access, than if such a space were divided amongst a number of houses in the shape of back yards that can, and generally do, get built over or filled with rubbish. This mode of appropriating old garden ground or back areas is probably the most judicious that could be followed in towns where so much waste back space is obtainable. For example, would it not be better to purchase the back yards of a score of houses that are now only used for lumber, and make a square or recreation ground of them, than to convert them into another roadway or sell the land for building? The larger sites of some of our new polytechnic institutions may well be utilised as squares or gardens. In these matters of laying-out towns our insular prejudices are much against us, and we may derive profitable suggestions from our Continental neighbours, who have always preferred to build round a square or a quadrangle than to pack solid blocks between parallel streets.

DECORATION.*

(Concluded from page 90.)

AND now to come to my special subject, I will give some hints as to the best manner of treating of a middle-class dwelling. I will begin at the entrance hall: of course there are many ways of dealing with this as with every other part of the house, so I may give several modes of treatment. It has long been the custom to treat the hall and staircase as unimportant parts of the house, to give them little or no attention, and so they have presented a naked, cold, and uninviting aspect—places to be hurried through as quickly as possible. The ceilings have been left white, and the walls painted one plain unbroken tint of drab or stone colour. The visitor obtains his first impression of the house on entering the hall, and it is desirable that he should be well impressed. We may first consider the ceiling: it should not be pure white, as garish whiteness is out of accord with all other colouring, that is, in connection with house decoration (the whiter your shirt fronts are the better). Well, the ceiling may be painted some shade, such as light vellum, or fawn colour, or some light shade of blue, neutral in tone, such as the shade presented in the duck-egg shell. The ceiling tint will be regulated by the colouring of the walls. This toning of the ceiling is good, so far as it goes, but there is no limit to the various ways it may be decorated. Stencilled ornament is one of the less expensive modes. And here, in speaking of stencilled ornament, it must not be thought that this is necessarily a cheap and nasty method of ornamentation, because we are all familiar with wretchedly designed and executed work of this kind. A stencil is a design cut in firm paper, cardboard, or tinfoil, and the colour is stamped through the openings, in all manner of printing. Now all manner of printing is not artistic, yet the capital letters in old Italian and German books are full of artistic design, yet they are printed too, so with the stencil plate. It first of all has to be designed, and the highest powers of draughtmanship may be brought to bear in the production of high class stencil work, the same design may be traced directly by hand, but the stencil plate is used as a quicker method of obtaining like results. The reason why so much work of this kind is inferior, is simply because it is difficult to do it well. Preston Town Hall, in England, decorated by Heaton, Butler, and Bayne, the eminent glass stainers and decorators, is nearly all stencil work, but yet it is one of the best decorated halls in England. I don't recommend stencilled in place of hand-painted work; where money is forthcoming, I prefer to do the latter. But to return to the hall ceiling, it is a simple and inexpensive way of getting a pleasing effect, to put a band of well-designed ornament round the ceiling, its breadth being regulated by the vestibule or hall, and there is no reason why the centre of the

ceiling should not be covered with a simple geometrical design in quiet colours, and treated flatly, without light and shade. A little gilding introduced in small spots and thin lines defining the leading forms of the diaper or panelling has a very good effect, but there is no limit to the richness and quality of design that may quite fitly be expended here; also, there are many alternate modes of treatment besides painting. There are beautiful paper hangings, specially designed for ceilings, besides several embossed or raised materials, such as Tynecastle tapestry, anaglypta, and Japanese leather papers, which, when harmoniously coloured, produce most pleasing effects. The cornice should be coloured to connect the ceiling and walls, care being taken to use light shades where the mouldings and enrichments are delicate. The treatment as to the division of the walls will depend on the height of the ceiling; but generally speaking, it is good to put a frieze under the cornice, and it is useful to have a dado here and in the staircase, following the rake of the handrail. The dado and wall space should be separated by a wooden mounted rail. The dado should be highly varnished, so as to allow of washing and dusting without the risk of soiling. The colour of the walls should be pleasantly warm—such as terracotta or even Pompeian red—the dado in deeper shades of the wall colour. Soft olive green is also good for staircase walls; blue, unless it be of the peacock shade or approaching a grey-green, had better be avoided here. The steps of stair, if of wood, should be stained a deep walnut colour; or if they be of stone they may be painted a dark shade of the dado colour, and varnished to allow of cleaning frequently. The hall and staircase walls may be papered. There are special designs made for the purpose that look very well, indeed, having friezes and dadoses specially coloured to match. The hall is a good place to hang etchings, autotypes, and engravings in quiet oak or black moulded frames, and where they form a special feature of the decoration, the walls should be painted a quiet shade, as a florid patterned paper detracts from the value of the pictures. The carpets and *portières* should be in strict harmony with the decorator's work, and should be chosen by him or the architect. I have often seen the whole harmony of colouring in a house destroyed by the unskillful selection of the carpets and hangings. The woodwork should be painted in one or more shades of maroon, or other rich brown colours and varnish; all graining should be avoided. I must confine myself to broad principles as I proceed, as I could multiply varieties of treatment without end. The dining-room should be sombre in tone, the ceiling a vellum colour in depth to suit the walls. It may be divided by wood mouldings into geometrical panelling, and these panels filled with Tynecastle tapestry or anaglypta. The effect of this is as if it were executed in low relief plaster work. The designs manufactured now are very beautiful. If the ceiling is treated in this manner, the walls may also be decorated with the same materials, for there are friezes and wall hangings made of the same stuffs. The painting and gilding on these surfaces can be as simple or as grand as may be demanded. They are capable of many and varied beautiful treatments. Immediately under the frieze should be fixed a moulded picture rail; this is much better than a metal rod, as it goes round the entire room as the cornice does. Its distance from the cornice will depend on the height of the walls. The advantage of lowering the picture rail is that it affords greater ease in hanging the pictures, and prevents the unsightly cords being seen to the same extent as when going to the cornice; by shortening the cords, too, pictures hang steadier and the chances of breakage are lessened. The moulding can be coloured to be in harmony with the walls, and rendered almost invisible, or it may be gilt solid so as to form a marked boundary to the frieze. The colouring of the walls should have reference to the pictures, and should not be too light in tone. Experience has discovered that dark reds or old gold colour, not unlike rich brown paper or dull tones of green, either cool and grey, or warm and brown, are the best for showing pictures to advantage. I painted the dining rooms of two of the Royal Academicians in London—Pittie's and McWhirter's—and in both cases the colour selected was a dark grey-green. Both artists found the full value of the colouring of their pictures brought out to the fullest extent on this dark background. The Royal Academy

walls are coloured a dark Indian red, and so also are the walls of the British National Gallery. As chairs are placed round the walls of the dining-room, it is good to put a chair-rail at the height of the chair-backs; this prevents the chairs from breaking the plaster. The dado should be coloured in relation to the walls above, and a good many shades darker; the dark dado takes from the bareness of a large room, and gives a cosiness and furnished appearance which does not exist when you can see each piece of furniture clearly defined against the walls. The woodwork should be painted good solid colours of Indian red or walnut shades, or black resembling ebony. I do not recommend decorating the panels with any kind of natural-flower designs. Thin flat hand-painted ornament in ivory-colour, resembling, but not imitating, inlaid work, is chaste and beautiful; if the wood is of good quality the panels may be decorated with various stains, in full and rich designs. I have decorated the saloons of many of the great ocean steamships in this manner. It is best to French-polish surfaces decorated in this way. As yet, I have dealt with the ceilings and walls as covered with embossed materials—either in low or high relief. The ceilings, where dust cannot settle, may safely have the designs in high relief, but those in low relief are more suited to the walls. The walls themselves may be formed into well-proportioned panels, not so small as to interfere with the placing of the furniture or the hanging of the pictures. The panels should be divided by wood mouldings and there should be a stile round each treated in flat tints of such a kind as to show the panel colouring to the greatest advantage. The French are partial to this mode of treatment, and I think it a very good one. It gives a rich, furnished appearance to the walls. Both ceilings and walls may again be oil-painted and decorated in a hundred ways. I have painted many of the finest houses in Scotland in this way, the ceilings being entirely decorated by hand with figures, wreaths, and ornamental compositions; the walls also being decorated with the like, specially designed, and hand-painted ornament. This is the most artistic manner, and no two houses are ever painted in the same way. Of course, ordinary wall papers may be applied here as everywhere else in the house, and if chosen by an expert very fine effects may be obtained in this manner. I don't think there is a wiser way of spending money than in making the home beautiful. Our wives and families spend most of their lives at home, and the enjoyment derived from beautiful surroundings is beyond estimates besides the refining influence it has on our children, there is no pleasure so constant, so soothing, so lasting and elevating, as that afforded by a lovely home. It is the most unselfish pleasure—pleasure, too, as all our friends may share it. In a room where there is heavy furniture, it is good to have a margin of, say, 30in. round the floor uncarpeted, so as to allow of the carpet being frequently taken up and shaken. This margin may be painted in some dark shade, agreeing with the carpet and dado—or if the floors are new they may be stained to a dark oak or walnut colour, and in both cases varnished. Wax-varnish is more artistic in effect, but is more liable to soil, and takes much more labour to keep in good order, and parquet flooring is better than either of the former, but is more expensive. The drawing-room is the ladies' special room, and should be bright and cheerful. It is difficult to deal with a subject like colour, to make you realise effects from mere description, and to describe in detail the many ways I could treat a drawing-room would merely confuse you, so I will be general in my remarks. All the materials described for the dining-room treatment would be applicable for the drawing-room. The dado is not so necessary here, as the chairs are not usually placed against the walls, and instead of the sombre hues suited to the dining-room, soft, quiet, and light effects are best, say cream or soft duck-egg shell, blue or French grey for ceilings, the walls fawn-colour or a richer French grey, or a deeper grey-blue, approaching peacock shade; all these are good for showing ladies' complexions and dress to the best advantage, and that is a consideration not to be overlooked. Water-colour drawings will also look well on these grounds; the woodwork may be creamy-white, finished with enamel varnish, this gives a beautiful, smooth and fresh effect. I think the judicious application of gilding in this room very

* Paper read by Mr. ANDREW WELLS before the Sydney Architectural Association.

advantageous, but the same remark applies to all the public rooms and hall. I think it is better to gild the small enrichments of cornices solid, than to break up the ornament of the large enrichments with points of gold, what is technically called hatching or picking out. The round, the concave, and small ogee mouldings always look well gilded, as their rounded surfaces catch the light from all points. The walls should be decorated with water-colour drawings, or etchings tastefully arranged; choice pieces of ornamental and Doulton pottery are beautiful and very decorative. I have fitted a narrow moulded shelf, supported on neat brackets all around the walls (except those occupied with cabinets), about four feet high from the floor, this shelf having a groove on the upper surface for holding plates and photos; this is to prevent them from sliding, and is a very pretty arrangement, as between the photos pretty pieces of pottery and statuettes may be placed. Above the shelf should be placed the water-colour drawings, etchings, and engravings. Or, instead of this narrow shelf, dwarf book-cases rising 3ft. high may be put around the room, and on the top of these the photos and ornaments may be placed. Books in themselves are very decorative in effect, besides the delight of sitting in rooms supplied with plenty of them. I think there should be many books in the drawing-room—it is the general sitting-room, and no one need ever be weary or suffer *ennui* who loves good books. I might speak for an hour of different modes of treating the drawing-room, but will here read the description of a house I decorated in Glasgow for Sir William Pearce—it will give an idea of the kind of work done in the houses of the merchants of the old country: The house of Sir William Pearce, the eminent ship-builder, is at 10, Park-terrace. This terrace crowns the hill overlooking the West End Park, and commands a view of the valleys of the Clyde and Kelvin, with the gently-swelling hills away to the south and west. The house has been decorated by Mr. Andrew Wells, of 8, Newton-terrace, Glasgow, a gentleman who has gained distinction by his superb work in the St. Andrew's Hall, and in many of the churches and residences of the city. In his work Mr. Wells shows himself a thorough artist; he evidently spares no pains in order to give his decorations the stamp of artistic perfection in design and execution. A draughtsman of great skill, taste, and spirit; a bold, original, versatile, and harmonious colourist, Mr. Wells has done not a little to vindicate the claims of decoration to be regarded as a living and growing art. In his work at Sir W. Pearce's house, he has had a splendid opportunity for showing his wealth of design, exquisite draughtsmanship, and skilful colouring, and of this opportunity he has fully availed himself. The entrance hall is divided into three parts by Corinthian pillars. The ceilings and walls are richly decorated with hand-painted ornaments and figures, each compartment being treated with special designs. The grounds of the ceiling of the vestibule are in various shades of light blue and gold, and the decorations generally in darker shades of blue, freely modelled, as in Persian tile painting. Thin lines of Persian red, orange, and gold are introduced very skilfully, to give emphasis to the framework of the panelling. The frieze is painted in darker shades of the ceiling colours. The cornice is tinted in shades of pale blue and fawn colour. The smaller enrichments and mouldings are gilt, solid Persian red being used with happy effect to connect the colours of the ceiling and the walls. The general tone is light, cool, and cheerful, and contrasts well with the full, rich treatment of the walls, which are divided into middle-space and dado. The ground of the middle-space is a delicate salmon colour; on this is planted a series of figure panels with gold backgrounds diapered with raw sienna. The figures represent the seasons; other spaces being filled by Italian arabesque and floral designs. A feature of the treatment of this panelling is the band of softened black which surrounds the golden centres. This band is about 5in. broad; it is bounded by gold and vermillion, and decorated with a very delicate arabesque in ivory colour. This combination of black, white, red, and gold produces a very rich and harmonious effect, and gives value to the lighter colouring of the ceiling and frieze. The dado is treated simply and broadly in various shades of dark brown, and varnished to give depth and support to the extreme richness of the walls above.

The cupola crowning the staircase is an especially happy piece of design. The cupola panels are of pale duck-egg colour, with stiles in cream-colour, enriched with broad and narrow lines of Persian red, and worked up with the colours of the panels to connect the whole together. The panels have subjects emblematical of Ceres and Flora on mosaic gold ground, with ornaments in Persian majolica blue, slightly modelled in delicate shades. The cornice is in deeper shades of the stile colours, relieved with gold and Persian red. The staircase upper frieze, immediately under the cornice and cupola, is about 24in. deep, and is enriched with groups of boys alternating with dwarf Renaissance columns, from which depend festoons and floral wreaths; over each of these festoons is a gold patera, while lighter and more delicate foliage fills up the background. Under the frieze is a Greek key and patera border, in shades of chocolate and black on a crimson ground; this gives a good solid base for the figures. The main walls of the staircase are coloured in stages, working from a soft red in the lower part to a warm primrose colour at the stair-head. The various shades of gradation are separated by bands of hand-painted ornament. The woodwork is painted with very dark Indian-red, toned with Prussian blue, and finely polished. Sketch No. 5 shows the ceiling of the dining-room. The ground is a rich cream colour, all the decorations being hand-painted in soft harmonious tones of olive-green, primrose, orange, and neutral tones of blue. The framework is mainly in lines of Persian red and gold. The general effect is warm and delicate. The frieze has a solid gold ground, decorated with a conventionally-treated floral design, the flowers being painted in shades of primrose-white, with hearts of citrine and delicate orange; the leaves are in shades of green, the whole being outlined with soft red. The walls are painted dark red, to form a good background for the splendid pictures which adorn this room. The dado is covered with dark russet browns, and panelled with darker shades of the same. The woodwork is painted dark chestnut colour, the panels being decorated with a beautifully-drawn Greek design in very thin lines of ivory colour, conveying the feeling of inlaid work, and giving an effect of elegance and refinement. The pillars at the end of the room are in dark chocolate and gold, the caps bronzed and lacquered, with the projections in gold; the whole being highly polished. Sketch No. 6 shows the arrangement of dado and frieze of library. The drawing-room ceiling is, perhaps, more daintily painted than any other part of the house. The leading colour is pale moonlight blue on a cream ground; this is contrasted by various other effects in warm but delicate tones. The corners are enriched with draped female figures; and in the spaces between are groups of winged boys bearing lightly-blown wreaths of ivy, and, guiding by gossamer bands, birds flying in couples. The ceiling border is in darker shades of the same moonlight blue, with flowers in cream, cinnamon, and gold. The walls are rose colour, with textile and gold effects. The woodwork is in shades of ivory, greenish-white, and duck-eggshell colour, with gold on the mouldings. The same thoroughness of design is carried throughout the house with an infinite variety of effect, which is as rare as it is delightful and charming. To Mr. Wells the decoration has evidently been a labour of love, and the success he has achieved is not only creditable to his versatility and power as a draughtsman and colourist, but also to his thorough conscientiousness as an artist-decorator. Nor should Sir William Pearce's share in the matter be overlooked. At a time when many merchant-princes, and others, are content to have their mansions painted and papered in the sleepy, commonplace manner proper to the dark ages of taste, he has had the originality and boldness to have his house done in such a way that each room becomes a delight to the eye and a source of perennial interest to all who enter it. This is the kind of work I should like to do here, and I believe more of it would be in demand if it were generally known that the necessary talent is at hand. The morning-room I will not describe further than to say it should be light and cheerful, and cool in tone. French greys and light blues are good. It may be painted entirely, and decorated in a simple manner, or any of the wall coverings may be used here quite fitly. The library is better to be subdued in tone, but not gloomy. The wall should be the background for rare prints and etchings, so it should be

painted, or if papered, some old rich leather effect is good, with a pattern not over conspicuous. The ceiling and cornice coloured to match, and the woodwork, as in the dining-room, dark and decorated with thin lines and ornament. The books should be easily accessible, and low book-cases, not more than 5ft. high or lower, look very well. I think it is better to have no glass in front of the books, except, perhaps, to protect the rarest or very valuable ones. I have observed that those placed beyond reach of the hand are rarely opened. The floor should be stained or painted all round, say, 1ft. in front of the book-cases, so that the carpets or rugs may be lifted without disturbing them. The bedrooms should be dealt with, as to the colour, according to their aspect; those getting much sunshine should be cool, and those in shade warm, in tone. I think it good to paint the ceilings and walls of bedrooms; the walls may be finished with a dark gloss; the paint being partly mixed with varnish. This allows of their being washed down without injury to the paint, and insures that they shall be always fresh and clean. Walls painted in this manner will last a lifetime; the walls and ceilings may be perfectly plain; but there is no reason why a ceiling should not be decorated in a simple way, with line borders and corner ornaments, or even in a fuller manner. In the children's rooms it is as well to have dados that may be fully varnished. Of course the walls may be papered, without any breach of the fitness of things, and lovely papers are to be had in plenty, and some are made purposely to allow of sponging down. They are called sanitary papers; they are quiet in colour and very serviceable. The woodwork should be painted to suit the walls, generally in light tones, and if varnished so much the better; it lasts much longer, and all finger-marks can easily be wiped from it. I think it is best to oil-paint the ceilings in all cases, it lasts for many years and is easily cleaned, and if renewed can be done without causing the dirt and mess that distemper always produces, when washed off. The margins of floors should, in all cases, be stained or painted and varnished, so that the carpets may be frequently shaken. Freshness and cleanness in the bedrooms is of the utmost importance. For the same reasons the kitchens and offices should be oil-painted, and not distempered. The paint can so easily be washed down by the servants. It lasts so much longer than distemper, that the difference in the first cost is soon made up. Here the woodwork should be varnished, and the walls, for 5ft. up, the same. A simple line should be drawn at the top of the dado. For the outside of cemented houses there is no treatment that so effectually resists the tentry of rain as to paint the walls thoroughly, and when applying the last coat, to powder them with fine dry sand; when dry, this makes so hard a surface that water cannot penetrate it. It is more costly than ordinary painting, but it is practically imperishable, and so cheaper in the end. As to the best colours for outside painting, I don't feel that any hard and fast rules can be laid down. All tones of stone colour, from cream-yellow to terracotta, and dark chocolate may be used. I would avoid shades of green and blue on the cement, except they be very mutual in tone; from white through yellow tones to dark red and brown are the most suitable shades. When the walls are painted dark colours, then the window sashes and verandah woodwork should be made very light, say white tinted with yellow, green, or blue, or even pure white. On the other hand, if the walls are painted in light colours, the window sashes and other outside woodwork may most fitly be painted in dark shades, say olive green, Indian red, or dark peacock blue. The above is a very general survey of the house, but perhaps as much as can be profitably introduced into an hour's lecture, such as this. It is impossible to more than treat the subject on the broadest lines. I am embarrassed with too much matter rather than with too little, for practically there is no limit to the mode of treatment for every part of the house. I am far from thinking there is only one good way of painting houses; there are many. For instance, if character is wanted, the houses could be treated in purely Greek design, or Pompeian, and they are beautiful styles full of refined designing, and affording scope for full harmonious colouring. The Renaissance is founded on the Classic, but treated with abundant freedom and grace by the Italians and other European nations. The

various French developments of the Renaissance have their own beauties—Louis Quinze and Louis Seize are full of character, lightness, and elegance. But while I have seen much of this high class work and executed some, the ever-present regret one feels in the colonies is that so little of it is in demand. The country is probably too young, and feels itself bound to be content with humbler things until it can afford better. But of one thing I do complain, it is the system of tendering for every kind of work. Every contractor is assumed to be equally able to do artistic work. Cheapness is held to be the criterion of merit and not quality. Things are different in England. A man of merit there is treated with respect, and his worth acknowledged. I suppose things will improve here as we develop a richer and more leisured class. As this class grows, so the appreciation for art work of every description will grow with it. A consummation much to be desired!

LAND SURVEYING AND LEVELLING, AND THE TESTING, ADJUSTMENT, AND USE OF MATHEMATICAL INSTRUMENTS.

By G. W. COBHAM, P.A.S.I.,

("Crawter" and "Special" Prizeman of the Surveyors' Institution.)

(Continued from page 5.)

CHAINING ON SLOPES.—In the preceding articles we have assumed that the ground to be chained was flat and level. We now come to the question of dealing with slopes.

Fig. 32.—This is a section of a portion of a

Fig. 32.

chain line. AC is the ground line, AB is horizontal, and BC, FD, and AE vertical; AD is equal to AB. It is always assumed that the lengths on a survey are the horizontal lengths, and it will be evident from the figure that if AD be one chain, the horizontal distance AF will be less than one chain by the distance FB. One method of obtaining the correct distance is to hold the chain horizontal, as CE, the point A being determined by means of a plumb-bob, the string of which is held with the chain-handle at E. There are two obvious objections to this method. One, that there is usually great difficulty in judging whether CE is horizontal unless there are buildings in the neighbourhood that it can be lined with; a small error would not, however, much matter in ordinary work. The other objection is that a chain held off the ground will sag in the middle, making C and E too close together; this can be remedied to some extent by making CE shorter, half a chain or less, but then the continual changes render mistakes easy to make. The best way of finding the true distance is to observe the slope of AD and make allowance after having measured the actual distance AD. The slope can be accurately measured with a theodolite, but it usually is not at hand when chaining, and a small clinometer about as big as a watch is quite accurate enough for our purpose. The various kinds of clinometers will be described under Levelling. It is evident that a clinometer with a bearing surface barely 2in. long will not give a correct result if simply put down in the middle of the chain, as a stone or a hole would vitiate the result. It is usual to lay the offset rod on the ground, and place the clinometer on the rod. The rod being a considerable length, averages the inequalities, and gives the general slope of the land. The following table gives the number of links which have to be deducted from each chain, when chaining on the slope, to give the correct horizontal distance to the nearest quarter link. It

is calculated from the formula $F B = A B \cdot \sin. C A B$.

Angle of Slope.	Deduction.	Angle of Slope.	Deduction.	Angle of Slope.	Deduction.
4 0	1	9 30	1 1/4	15 0	3 1/4
4 30	1	10 0	1 1/2	15 30	3 3/4
5 0	1	10 30	1 3/4	16 0	3 3/4
5 30	1	11 0	1 3/4	16 30	4
6 0	1	11 30	2	17 0	4 1/4
6 30	1	12 0	2 1/4	17 30	4 1/2
7 0	1	12 30	2 1/2	18 0	5
7 30	1	13 0	2 3/4	18 30	5 1/4
8 0	1	13 30	2 3/4	19 0	5 1/2
8 30	1	14 0	3	19 30	5 3/4
9 0	1	14 30	3 1/4	20 0	6

When the slope exceeds 20°, the surface should be chained, and the angle observed with a theodolite, when the true horizontal distance is given

CROSS STAFF

Fig. 33.

by the formula $A B = A C \cdot \cos. C A B$. The allowance can be either made in the field, or it can be entered in the field-book and made afterwards. When each chain has its allowance of a few links, the allowance for other points in the line is complex, and errors are liable to creep in, so that in practice, instead of deducting the links from the chain, the chain is pulled forward a distance equal to the allowance. This method is not quite accurate, as it supposes that $D C = F B$, which is not the case; but the error is inappreciable when the angle is small. A table can be calculated from the formula: $D C = A B \cdot \sec C A B - A B$; when $A B = 1$ chain $D C = \sec C A B - 1$; moving the decimal point two places to the right gives the result in links. The result for 20° gives an allowance of $6 \frac{1}{2}$ links,

CROSS STAFF SECTION A. B.

Fig. 34.

so that the last table may be safely used up to that angle. When the chain is so pulled on, the arrow is put in and one chain is counted. If the allowance is large, a proportionate allowance may be made to get the true places where offsets are taken, but unless the ground is very steep it is not necessary. It is not the error in one chain that matters much, it is the accumulated error in long distances. It is, perhaps, hardly necessary to note that the chain must be pulled forward the same distance whether measuring up or down hill.

The Cross Staff.—This is a small instrument used to set out right angles for rough purposes, such as lines for cross-sections, &c., and is shown in Figs. 33 and 34. It is usually made of brass, and the cone at the bottom unscrews and screws

into the inside of the upper body for convenience in packing. It is not always octagonal; sometimes it is made cylindrical, and sometimes spherical. One side has a fine slit half-way down, and below this, and in the same line, there is a wide slit with a wire down the centre. Each narrow slit has a wide one opposite to it. For use, the eye is applied to the narrow slit, and the rod sighted through the wide one, the wire showing the exact place where it should be put. The long, narrow slits in the other four sides are to enable angles of 45° to be set out, but they are of no practical use. For use, the instrument is supported on a stand, the top of which is made to fit into the cone at the base of the cross staff, and in which it freely rotates, enabling the instrument to be turned in any direction. It is necessary for accurate work that the instrument should be upright, but there is usually no means of telling whether it is so or not. Sometimes the cross staff head is cut horizontally through the middle, and made to turn with a rack and pinion, the edge being graduated so that any angle can be set out. It is not capable of doing this with any great accuracy, owing to the necessary thickness of the wires. Some forms of the instrument have a trough compass on the top, so that it can be used to take the magnetic bearing of a line.

Fig. 35.—This shows the general scheme of testing any instrument made for setting out right

Fig. 35.

angles. A, B, and C are put in the same straight line, and the instrument is set up over B. One sight is put on A, and D is set off in the line of the other sights purporting to be at right angles with the first. The sights on B D are now put on B C, and the sights first put on A used to set up the perpendicular. If this coincides with D the instrument is correctly adjusted (Euclid I. Def. 10). If the instrument was not in adjustment, and the staff was put up at E at the first observation, it is evident that another will be set up at F on the second observation, the angles E B A and F B C being equal, and the angle E B F double the error of the instrument. A staff set up midway between E and F will be in the perpendicular from B, so that by double observation an imperfect instrument may be made to give a correct result.

ERRATA.—On p. 5, column 1, line 36, for C D read C B. On p. 5, column 2, line 7, read: "will be the length A X; or, $A X = A C^2 / A B$." On p. 5, column 2, line 8 from bottom, for C E read C F.

(To be continued.)

THE LIVERPOOL WATER SUPPLY.

AS we briefly announced last week, the Duke of Connaught inaugurated the new water supply of the City of Liverpool on the 14th inst. The scheme is a grand one, and should make all Londoners ashamed of themselves. It has been twelve years in hand, and has cost £2,132,867. When it was started it was expected that the work would be finished in four years and would cost £1,559,996. Vyrnwy is 77 miles off by the route which the aqueduct takes. It is, we believe, the longest aqueduct in the world. The principle of the scheme is the same as that adopted in Longdendale by the Manchester Corporation. Vyrnwy Lake has been brought into existence by throwing a great dam across the valley of the river. The village of Llanwddyn was sleeping in the heart of the valley when the Corporation came upon the ground. It consisted of a church, two Nonconformist chapels, and some forty cottages. The village was destroyed, and a new set of houses was built higher up on the hill. The great feature of the work is the

embankment across the valley. It is built on a foundation of solid rock and into the solid rock on either side of the gorge. The lake behind it is about five miles long, half a mile wide, and in parts 84 feet deep. To resist the enormous pressure every precaution has been taken in constructing the embankment, and it is satisfactory to know, on the authority of a great engineer, that nothing short of an earthquake can damage it.

The water supply of Liverpool, and of the district of which Liverpool is the centre, has been under the control of the Corporation since the year 1847. Up to that year the waterworks were in the possession of private companies, who obtained water from wells sunk in the new red sandstone on which the city is built. The supply given by the companies was very inadequate, the water only being allowed to be on for two or three hours a day, and that only once or twice a week. When the Corporation acquired the waterworks they came under obligation to provide such a supply of water as would permit of water being constantly laid on to every house within the limits. To enable them to accomplish what they had undertaken it became necessary to obtain a very much larger quantity of water than was then available. Many schemes were suggested and investigated, and ultimately a large tract of wild moorland in hilly country between Bolton and Blackburn, in Lancashire, was selected as the source of supply. In the valleys below these hills extensive reservoirs have been constructed capable of holding upwards of 4,000,000 gallons of water. These reservoirs extend upwards of five miles. The rivers and streams which flow into these reservoirs yield water of an excellent quality, especially adapted to the needs of Liverpool, and this is the scheme known as the Rivington water supply. This Rivington supply was brought into Liverpool in the summer of 1857, thirty-five years ago, and it was then expected that it would satisfy the requirements of Liverpool for a long future. In less than ten years the yield of Rivington and the wells proved insufficient to meet the demands of dry seasons, and although the Corporation had spent more than £2,000,000 on their water supply there was already a scarcity. The growth of population and the demands of trade were very rapid, and the spread of new sanitary ideas and appliances led to a constantly increasing use of water. For some years the deficiency was met by making additional reservoirs and sinking additional wells, and also by restricting the distribution and checking waste. In the meantime the examination of new sources of supply was vigorously proceeded with. The Council, warned by previous experience, resolved that any scheme adopted by them should not only be sufficient to supply Liverpool for at least thirty years, but should also be capable of being extended in such a manner as to satisfy any demands that could possibly be foreshadowed. Ultimately, and after protracted inquiry, the Vyrnwy scheme was chosen, and the Royal assent was given on the 6th of August, 1880, to a Bill for carrying out these works. In selecting this scheme the Corporation had the benefit of the labours of a Royal Commission, presided over by the Duke of Richmond, which in 1866-7 reported on the Vyrnwy Valley as part of a scheme recommended by an eminent engineer, the late Mr. J. F. Bateman, for the supply of London. The principal features of the Vyrnwy works as carried out by the Corporation are: (1) A reservoir in the Vyrnwy Valley among the Berwyn Mountains nearly five miles in length by half a mile in width. (2) This reservoir is formed by the building of a massive masonry wall across the narrow part of the valley. This wall is 1,172 ft. long at the top, and its extreme height is 161 ft. from the lowest part of the foundation to the parapet of the carriage-way. (3) The greatest depth of water is 84 ft. (4) When full the reservoir holds more than 13,000,000,000 gallons of water. (5) When the scheme is fully developed the reservoir will receive the rainfall from 23,200 acres of watershed, and the quantity of water which this gathering ground will yield will be sufficient to give Liverpool a supply of 40,000,000 gallons a day, after sending down the river Vyrnwy the compensation water which, under the Act of Parliament, the Corporation are bound to deliver in aid of the river Severn, and which compensation amounts to 13,500,000 gallons of water per day. (6) To convey the water from Vyrnwy to Liverpool the Corporation have constructed an aqueduct sixty-eight

miles in length, terminating at Prescott, a distance of eight miles from Liverpool. (7) About four miles of the aqueduct is in a tunnel capable of carrying the full supply of 40,000,000 gallons per day; but for the remaining sixty-four miles iron pipes have been laid to carry one-third of the ultimate quantity, or 13,000,000 gallons per day. The additional lines of pipes will only be laid as the demands for water increase. (8) The whole of the water will be filtered through sand filter beds, which have been constructed near to the town of Oswestry, in Salop. (9) The surface level of the Vyrnwy reservoir is 325 ft. above the Ordnance datum—that is, above the sea level at Liverpool; and the water is delivered at Prescott at an elevation of 275 ft. above the Ordnance datum. (10) Therefore, 550 ft. of head are expended in carrying the water by gravitation along the aqueduct. For engineering purposes, the aqueduct is divided into six sections, in each of which a balancing reservoir is placed for the purpose of regulating the pressure or head of water. The most difficult and tedious part of the aqueduct has been the crossing of the river Mersey. Here the Corporation, owing to the opposition of the town of Warrington and riparian owners on the Mersey, were compelled to form a tunnel through ground and under conditions which made the driving of a tunnel not only very difficult and slow to carry out, but entailed upon the Corporation a large extra outlay which was not contemplated in the original scheme. The Corporation are now in a position to command a supply of more than 30,000,000 gallons of water per day, or sufficient to supply the requirements of 1,200,000 people. When the Vyrnwy works have been fully developed the water resources of the Corporation will be sufficient for the necessities and requirements of a population of at least 2,300,000. The actual population now within the Liverpool area of supply is between 800,000 and 900,000. The actual average consumption of water per day is 20,000,000 gallons.

ART EXHIBITION OF THE LONDON SCHOOL BOARD.

A CONSIDERABLE advance in the art education of the pupils of the London School Board has been made during the years which have elapsed since these annual exhibitions commenced. On one or more of our earlier visits we remarked on the inferior kind of instruction given, or rather of the number of works which showed a misdirected application of latent art capacity, such as copies shaded and coloured from illustrated newspapers and comic serials. We have now to record an exhibition of artistic work done by the children and pupil-teachers which has been on view at the Law Society's Hall, Carey-street, Chancery-lane. Owing to the want of space it was found only possible to show about one-fifth of the 3,000 exhibits which were sent in. A recent development in art instruction is one of the leading features of this collection. We allude to the manual training on paper in colour, and in woodwork, which has been practised for the last two years we believe. This class of handwork forms a large proportion of the whole bulk of exhibits. The "paper work filling and supermounting," as it is called, consists in supplying sheets of cardboard divided into lin. squares, each of these being subdivided into $\frac{1}{4}$ in. squares, to the scholars, with sheets of coloured paper also ruled with the same squares, made adhesive at the back. The pupil takes these sheets, and upon them he can pencil any diagonal or other lines across or coincident with the small squares, and cut them out, neatly fitting or supermounting them on the cardboard in any design or arrangement he may invent, so as to form geometrical patterns, and in this manner he can exercise his faculties of invention and design. Prizes have been awarded to pupils, boys and girls, in many schools. Among these, the work of the Rolls-road Boys' School, the Dalgleish-street, the Burghley-road, Monson-road, Beethoven-street, and Ben Jonson schools must be particularly mentioned. Many of the ornamental arrangements of the coloured squares show much skill and inventive power that may be turned to useful account in pattern and tile designing. The value of this manual training not only helps the pupil to cut out and arrange with precision, but to exercise and develop his visual and mental organs. The geometrical edu-

cation he receives is invaluable in teaching him how much can be done on square and diagonal lines. Another kind of manual training is afforded by making cardboard models of solids, such as cubes, prisms of various sides, pyramids, polyhedrons, &c. Many prizes are given for this work to pupils of Marylebone, Burghley-road, and Waterloo-street schools.

Besides cardboard and paper and colour-work we see many excellent examples of woodwork, chiefly inlays for ornamental purposes, book-racks and other simple kinds of joinery, which have been arranged under the Technical Education Act. These exercises are not intended to do more than to teach the pupil the right use of tools, not to instruct him in joinery or any specific application, as such a course would be injurious to the trades. The designs for wall-papers, &c., are numerous, and many of them indicate artistic arrangements of no mean power. These chiefly are by female pupil-teachers, and we may notice as exceptionally good the following: A conventionalised treatment of foliage and flowers, green and red, by Susan Griffin, of the Nelson-street School, aged 14; a clever arrangement of squares diagonally disposed, with brown ornament, by Mabel Joeliff, of Peckham School, second-class prize; a geometrical design of ornament in squares, by Elizabeth Tarrant, Stockwell School. Jessie Phillips, of Nelson-street School, takes a first-class prize for an original design for a plate with a clever border and a geometrically designed centre; and the same school contributes a design for a hexagonal tile of neat design by Maude Bone, aged 17, and a clever conventional tile design by Amelia Gaywood, aged 15, which wins a second-class prize. Another cleverly treated tile of natural foliage and stem by Leslie Keating, of Deptford School, takes a first-class prize.

A well-arranged design for a coloured muslin natural folial treatment by Eliza Howard (Marylebone) wins a third prize; and Hettie White, of the same school, takes a third prize for a circular plaque. A panel design of natural foliage by Maude Baxter (Deptford) is awarded a first-class prize. The same prize is given to W. Kestle (Chelsea) for a cleverly-arranged tile pattern based on the octagon, well drawn, and in nice colour. Other recipients of prizes send designs of merit.

The examples of Venetian iron-work executed with only two tools, and the hammered embossed metal-work turned out by the Thomas-street School, Limehouse, under the new scheme of manual instruction, three months' work, are encouraging evidences of the value of this teaching. These latter are merely panels and plaques, the tools used on them comprising chaser, bossing tool, &c., being made by the boys. The casts include several examples of merit, amongst them we notice a lion's head, a honeysuckle frieze by H. Mitchell, Walham-street School, and several panels in relief; also several outlines from casts. The freehand drawing of this class includes an acanthus-leaf ornament by Percy Cowham, Oldfield-road School, which wins a first-class prize, and excellent work from Brackenbury-road, Gillespie, Portobello, Montam-street, and other schools. The shaded work includes clever chalk drawing of lion, a donkey, a tiger, and also from models. The brushwork without outline, sent by the Thomas-street School, is useful as an initiative stage of manual training in design. We notice one or two good designs for wall-papers are unrewarded. The perspective drawings by pupil teachers make a large display, and show decided progress. Models of horizontal steam-engines, a steam derrick, &c., praiseworthy. Altogether £50 has been awarded in prizes for drawings, and £20 for the manual class of work.

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

THE annual meeting of the above Association is being held this week at Bury. The president is Mr. J. Cartwright, Mem. Inst. C.E., F.S.I. The members assembled yesterday in the Town Hall, kindly lent for the occasion by the Earl of Derby, K.G. At 10 a.m. there was a meeting of the Council in the Corporation Offices, Bank-street; at 11 a.m., annual meeting of members, with a reception by the Mayor, Mr. Councillor Ashworth. The annual report was read, and followed by the presentation of premiums. Mr. W. G. Scoones then moved, "That, in the view of the fact that the Association now numbers over 500 members, the

number of elected members on the Council ought to be increased from 12 to 15, and this general meeting begs respectfully to request the Council to take such steps as may be necessary to have the Articles of Association amended in order to carry out this resolution." The presidential address was then delivered, followed at 12.30 by luncheon with the Corporation of Bury, under the presidency of the Mayor. The meeting was resumed at 1.30 p.m., with papers and discussions on the "Factory and Workshops Act, 1891," by Mr. H. P. Boulnois, Mem.Inst.C.E., City Engineer, Liverpool, and "Electric Traction," by Mr. J. H. Cox, Mem.Inst.C.E., Borough Engineer, Bradford. At 2.30 p.m. the members proceeded in brakes to Fleet-street and Market-street, to view examples of wood pavement in construction. They then inspected Irwell Forge, the Lowercroft Bleach Works, the Whitehead Recreation Ground, and the railway siding in course of construction connecting the Corporation Gas Works with the main line of the L. and Y. Railway Company. At 6 p.m. the annual dinner was held in the Town Hall.

To-day, at 10.30 a.m., the following papers will be read and discussed at the Town Hall—viz., "Sewage and its Purification," by C. A. Burghardt, Ph.D., &c., Lecturer and Examiner of Owens College, Victoria University; "Rivers Pollution and Rivers Purification," H. A. Roehling, C.E.; "Utilisation of Water Power," H. G. Coales, C.E.; and "The Ordnance Survey" (with diagrams), H. T. Crook, C.E. At 1 p.m. luncheon will be partaken of with the Corporation of Bury, under the presidency of Ald. C. Brierley, J.P., Deputy Mayor. At 2 p.m. there will be visits to Messrs. Wrigley's Paperworks; the felt hat manufactory of Messrs. Lucas; the Corporation store-yard, stables, workshops, destructor, and exhibits; the Peel Mills; Messrs. Musgrave's quadruple engine working with steam at 200lb. pressure—the latest development of the steam-engine and steel boilers; and the electric light installation of Messrs. J. H. Holmes and Co., of Newcastle-on-Tyne. From 6 to 9 p.m. there will be a garden party, by invitation of Ald. John Parks, J.P., ex-Mayor.

To-morrow a visit will be paid to Bacup, where, arriving at 10.29 a.m., members will be conducted in brakes to Sir Thomas Brooks's extensive Millstone Grit Quarries at Britannia, when Mr. H. Bolton, assistant keeper in geology at the Owens College Museum, Manchester, and author of the "Geology of Rossendale," has kindly promised to give a short address on the geological features of the district. At 12.30 a.m. members will proceed by brake to "Clough Bottom" Reservoir in construction (via Bacup). At 1.15 p.m. luncheon with the Corporation of Bury, at White Lee House, "Clough Bottom" Reservoir, under the presidency of Councillor Bentley, chairman of the Waterworks Committee; at 2 p.m., inspection of the works in progress, with description by the engineer (the president), and a geological sketch by Mr. H. Bolton.

SOCIETY OF ENGINEERS.

ON the 20th July a visit was paid by the Society of Engineers to the A. B. C. Sewage Works, Kingston; the Southwark and Vauxhall Water Co.'s Works, Hampton; and Messrs. Willans and Robinson's Works, Thames Ditton.

The Kingston Sewage Works have been constructed for treating, by the Native Guano Company's processes, the sewage of 35,000 people, but with certain comparatively inexpensive additions they will meet the requirements of a population of 50,000.

At present the sewage being treated is	
that of Kingston, with a population of	27,057
Surbiton " " "	10,052
Hampton Wick " " "	2,378
Total.....	39,487

The Kingston sewage on reaching the works passes into the screening chamber and through a grating, which intercepts coarse matter likely to choke or injure the pumps, and thence through a culvert to a pump well under the main building, where it receives the "B.C." or deodorising and purifying mixture. The sewage thus partially treated is raised about 12ft. by centrifugal pumps, of which

there are three, each driven by a 15 horse-power engine, and capable of lifting 1,650 gallons per minute. The pumps discharge into a meter chamber, where the sewage is measured and the quantity registered. On leaving the meter the sewage flows along an open channel to the settling tanks, receiving on its way the precipitating agents. There are eight tanks, each 85ft. long by 50ft. broad and 6ft. average working depth, holding 150,000 gallons, or 1,200,000 gallons in the aggregate, which gives a capacity of 30 gallons per head for a population of 40,000.

The treated sewage flows in a continuous stream through the tanks, precipitating as it flows, and passes clear, bright, and odourless into a covered channel discharging into the Thames. The tanks are cleaned periodically, the deposit or "sludge" being pumped into the sludge-well by a Tangye-Holman double-action pump at the rate of 500 gallons per minute. From this well the sludge is first drawn into six sludge vessels, or accumulators, by the creation of a vacuum, and is then forced by air pressure, at 100lb. on the square inch, into filter presses on the first floor of the building, from which it is removed in hard cakes. There are three of Scott's air-pumps and sixteen of the Native Guano Company's filter presses. The pressed cakes are dried in a Borwick's drying cylinder (with fan and condensing apparatus attached), ground into powder, bagged and sold as Native Guano at £3 10s. per ton. The Surbiton sewage is separately received and screened, and is pumped by centrifugal pumps, through a meter, into the Kingston pump well. There are three pumps, each driven by an 8 horse-power engine, and capable of lifting 750 gallons per minute. The boilers are of the locomotive multitubular type, working at a pressure of 150lb. per square inch—one of 80 horse-power and two of 60 horse-power each. The two main driving engines, each of 40 horse-power, are used alternately, and, like the pump engines, are of Messrs. Willans and Robinson's patent kind. Two mortar mills are used for grinding the chemicals, which are then mixed in vats and discharged into the pump-well; and there are two vats for dissolving the precipitating agents. A small centrifugal pump supplies water from the river for the boilers, mixing the chemicals, &c.

The Southwark and Vauxhall Water Company's works at Hampton were commenced in accordance with the provisions of the Metropolis Water Act, 1852, the first supply being pumped from Hampton to Battersea, to be there filtered and distributed, on the 5th July, 1855. In 1867, additional works were commenced on the adjoining land, having for their principal object the supply of the western portion of the district, these were completed and taken into use in the spring of 1870. The details of the present arrangements are as follows:—A portion of the supply is conveyed through a 48in. conduit pipe to the subsiding reservoirs, from thence pumped by three engines of the direct-acting or "Bull" through a 36in. trunk main under a head of 135ft. to the company's works at Battersea, where it undergoes a further process of subsidence and filtration before it is again pumped to the district for distribution. Another portion is conveyed through a 36in. conduit to three filters having an area of 3½ acres. It is not usually necessary to admit water at this point, as the supply to these works is supplemented by several million gallons per 24 hours from the natural filtration works hereafter described. It is then pumped by two sets of direct-acting rotative compound engines against a head of 275ft. for delivery through 30in. and 42in. trunk mains, partly to the reservoirs at Nunhead and partly direct to the district. A pair of Cornish beam engines are kept in reserve for the supply of this 30in. main. The supply of water obtained from what is called "natural filtration" system occupies two fields and an island, having a total area of 39½ acres. The river water is admitted to these two fields through a vertical gravel filter, and the gravel subsoil is thus charged by a system of glazed earthenware pipes, 24in. diameter, laid with open joints. The water, after having percolated through the sand and gravel, is collected by a system of 24in. earthenware pipes, laid with open joints on the surface of the clay. The water is then conveyed through two 36in. conduits to the engine-house, and delivered to the filters before referred to.

THE PROPOSED STRAND IMPROVEMENTS.

AT the meeting of the London County Council on Tuesday the Improvements Committee reported upon the contemplated improvements in the neighbourhood of the Strand, the aim of which is to combine a first-class thoroughfare from Holborn to the Strand with the widening of the Strand at Holywell-street and at St. Mary-le-Strand; to open a direct thoroughfare from the north to the Strand, Temple Bar, Fleet-street, and the Embankment going eastwards, as well as for the traffic towards the Strand, Wellington-street, and Waterloo-bridge westwards; to improve the communication between the Covent-garden or Long-acre district and the Lincoln's-inn district; to open and improve one of the most unsanitary and decaying quarters of London; to offer an opportunity for a central and commanding site for a new County Hall. The estimated cost of the improvement is set down at £121,000 for work, and £1,985,000 for property, making a total of £2,106,000, which would amount to .73 of 1d. in the pound on the rates for the first year. The committee recommended that the Council should apply in the first Session of Parliament in 1893 for powers to construct a new street from Holborn to the Strand, which, it seems, is to be called "The Council Broadway," and for widening the Strand and improving Holywell-street, and for subsidiary street improvements according to the scheme submitted; that provision should be made for the construction of a subway under the new street (for mains, wires, &c.), and also for the planting of trees in the new thoroughfare; that provision should be made in the Bill that the owners of property benefited should contribute, and that, with a view to ascertain what special benefits would be conferred by the proposed improvements on the owners of property in the vicinity of them, it should be referred to the Improvements and Parliamentary Committees to report jointly to the Council on the framing of the Bill; that it should also be referred to the Improvements and Parliamentary Committees to consider and report jointly whether the limits of deviation on the deposited plans should be sufficiently wide to enable the Council to purchase property comprised in the larger schedule, and also that between Wych-street and Holywell-street, and that it should be referred to the Public Health and Housing Committee to consider and report the best mode of re-housing the persons of the labouring class who would be displaced by the construction of the new street and its approaches. After a long discussion the further consideration of the scheme was postponed till to-day.

BELGIAN PAINTINGS AND SCULPTURE AT EARL'S COURT.

AN addition has been made to the art galleries in connection with the International Horticultural Exhibition at West Kensington, mainly consisting of a series of oil paintings and sculptures contributed with the approval of the Belgian Government. The pictures include a few of architectural interest, such as "A View in Bruges," by M. Stroovant, showing the big belfry in the distance over the picturesque and piling roofs rising to the left of the canal water-way, which forms the subject of the picture. A red brick convent turret breaks the sky line on the other side, with its conical spirelet, and beyond is a stone-built loggia at the water's edge, midst a quaint group of oriels, gables, and shutter-furnished windows. M. Vanderheest shows a riverside view from Dinant, with the bright-coloured restaurants on the quay. In the background over the Meuse appear the wooded slopes of the hills beyond. A church side altar (892) by M. G. Vanaise is interesting as a specimen of dignified Renaissance work rigidly confined within strictly dominating architectural lines. The reredos is all gilt, with paintings of sacred subjects in the panels, and the richness of the composition is set off to advantage by the plain wall-surface of the return wall of the chapel. The old men in the picture add scale without being too much in evidence. As a contrast to this last is the life-size study by M. A. C. Clayenar of a nude girl prostrate on a bear-skin mat by the side of a marble fountain. The foreshortening of the figure is skilfully managed, though the idea of the pose is essentially French. A softly-painted seascape by

Bouvier attracted our notice for the brilliant aerial effect of the sunshine behind the clouds, and David Oyens' "Corner of a Studio" exhibits a solid handling of bold and varied colourings massively treated, notwithstanding the crowded arrangement of the subject. M. Jacs Carabain shows a view in Italy with a familiar campanile in the background. A white bronze bust of St. George, by Ch. Vander Strappen, deserves mention for the picturesque arrangement of the accessories and capital modelling of the head. Ruth "Gleaning" is a statuette of merit, by J. Willens, in red bronze, and other examples deserve naming, such as a sleeping girl holding a violin, by De Viques. Wolfers, Mignon, Meunier, and Samuel are among the other sculptors. M. Conrad Dressler, in the adjoining gallery, shows an heroic statue of a gladiator wrestling with an octopus, and the same artist sends a bust of H. M. Stanley, and another of the late Father Mackonochie in Cassoch and Biretta. The Right Hon. A. J. Balfour, M.P., is represented by Mr. E. V. Williamson, of Esher, and Mr. H. T. Margetson exhibits a bronze bust of Mr. Maurice B. Adams, F.R.I.B.A. The late Lord Beaconsfield is modelled by M. E. E. Geflouski, and a group in terracotta, called "There's Father," is by another foreign artist. We may name, in conclusion, an exceedingly graceful statuette of a girl holding a mirror (292); but no particulars of the author are given.

THE DICTIONARY OF ARCHITECTURE.*

AFTER a long intermission we have received the concluding part of this Dictionary, which has been dragging through a lengthened period of 40 years, and has outlived, in the course of its preparation, all but six of the original gentlemen who formed the committee of the Architectural Publication Society, which was initiated by Mr. Wyatt Papworth. That committee included some of the leading architects of the day, and comprised Samuel Angell, Arthur Asphitl, Sir Charles Barry, R.A., Ewan Christian, Professors Cockerell and Donaldson, T. Hayter Lewis, William Tite, F.R.S., Sidney Smirke, R.A., and many more. Upon Mr. Wyatt Papworth, whose learning, patience, and devotion have been called into requisition, has devolved the labours of compiler, editor, and reviser, and we can say these duties have been most faithfully fulfilled. The original intention of completing the Dictionary in three years may be mentioned to show how far wrong in their calculations the committee were, and how futile is the attempt to produce a Dictionary of Terms in so short a time. The interesting facts in connection with this undertaking brought together by Mr. Arthur Cates in his *Retrospect*, whose labour as one of the committee of revision, and as hon. secretary since 1858, demand recognition, are worth perusal. The list of contributors include many eminent members of the profession, several of whom have not survived the completion of the work, and here we cannot but regret that so much valuable information and labour has been expended in a work that must be admittedly, from the lapse of time, very imperfect and wanting in the essential of being "up to date." Very many new terms that might have been included in the text are necessarily not to be found, and articles on archaeology, scientific application, and manufacture cannot but be incomplete in the earlier parts.

The part before us, XXIII., comprises the letters T—Z, and the title page, contents, and list of subscribers. The number of letters included renders this part a valuable one. The number of terms under "T" are considerable, and comprise several important architectural subjects. "Tabernacle," one of the first, gives the Latin, Spanish, French, and German equivalents, such as *sacrarium*, *ciborium*, *custodia*, and *sakramentshaus*, the latter the German name for receptacle for the consecrated Host. Besides a condensed description of the various forms of tabernacle used for the Blessed Sacrament in different countries, as a cupboard in the wall, a ciborium as used in France, and the English mode of suspension, as by a dove with canopy or a standing receptacle or tabernacle of stone or metal on the altar, as at St. George's, Southwark, the article notices some of the chief artists, and gives a list of dated examples. The *Building News* (Walcott), 1873, is referred

to. Under "Tank" various kinds are described, as the *koodh* of India, and various references will be found to rainfall and farmyard tanks, Robert's "rain-water separator" being mentioned, and under this head reference is made to our pages Vol. 1875. Tar pavements receive notice, and their composition is given. The biographical notices include several Taylors. John Taylor, M.A., F.S.A., designed the stations on the Chatham and Dover Railway, and new buildings at Roupell Park, Brixton. His patents for damp-proof course and roofing tiles are well known. Sir R. Taylor receives a long notice of his works. Very inadequate is the article on "Technical School," which, like many others, only refers to treatises, without any explanatory particulars of plan or requirements. Information on these points, with a few typical plans, would have been of value. The arrangements of Egyptian, Greek, Roman, and Indian Temples are more fully described. Many articles are only bibliographical notices, and some of these might have been omitted to make room for extended articles on subjects of daily requirement. We think the merely dictionary definition has been carried too far in many instances, as, for example, in "Tender," "Tenement," "Tenon," "Tensile Strength," "Tension," "Tenure." Terracotta has nearly four columns devoted to it, and the writer refers to Mr. A. Waterhouse's, Natural History Museum, the Constitutional Club of R. W. Edis, besides references to our pages and other treatises. A list of early examples is given, but we do not find any mention of the late improvements in the manufacture made by Messrs. Doulton. Testing is fairly treated, though several important facts and improved appliances are unnoticed. Under "Theatre" the names of ancient writers on the subject are given, the principal modern theatres and opera houses are enumerated; but no description of the requirements of a modern theatre, nor any data as to entrances, corridors, or stairs, as now required by by-laws, are given, an omission certainly. The same bibliographical fulness accompanies the subject "Thermæ," but we do not find any reference to modern baths. Thirteenth Century architecture is confined to the names of lectures, such as Scott's, and to papers read and reported. Some valuable particulars are given of tile pavements and walls. Timber is treated and the leading authorities quoted. Under timber-building is described buildings entirely of this material, and the book references are pretty complete; but no mention is made of modern work. The word "Tower" does not receive the attention it deserves, nor can we say that Tudor architecture is representative of the period, as it deals only with the reign of Henry VII. The letter "U" occupies only a few pages. Vault and vaulting are fully treated. Venice is comprehensively described, and a list of churches, palaces, and other buildings and a full list of books and views accompany the article. Under "W," the articles on water service, workman, Wren are comprehensive; but "workhouse" and "window" are too briefly dismissed. We have only selected a few typical names out of the many hundreds, some of them of very minor interest, that appear in this voluminous work. A vast amount of literary labour of a bibliographical kind has been expended, and the biography and topography have received a large share of attention, perhaps more than their importance in a work of this nature deserves. On the whole, the Dictionary will be invaluable as a work of terminology, despite the shortcomings in many of the articles devoted to special classes of buildings and details. On referring to any given subject the student will find a list of books and papers, and references to professional journals, where further information can be gathered, and this index-value of the Dictionary is no small boon to the architect, antiquary, and student.

LOFTY BUILDING CONSTRUCTION.

THE great pressure arising from the weight of the lofty buildings erected in Chicago is distributed and equalised by grillages or platforms made of several layers of steel beams embedded in concrete, thus obtaining a great projection of the footings with small depth. The soil is clayey, but underlaid in some parts by rock. In the construction of the buildings, General Smith, M.Am.Soc.C.E., speaking of those lofty structures, objects to the iron or steel framework used for supporting the floors, and

afterwards clothed with walls of brick or stone, and recommends instead masonry for the columns and walls; and in order to reduce their thickness, he proposes to "build them of blocks of the strongest stone" (he cites experiments with Lemont limestone), "laid on their natural bed with bearing surfaces planed perfectly true, and simply washed with a thin grout of Portland cement." The column blocks, he suggests, might be doweled together by a steel rod running through their centres, connecting cast-iron cap plates at the level of each story. To protect the limestone pillars, he proposes to cover them with a newly-invented fireproofing 2in. thick, which is such a good non-conductor that, it is said, when brought to a white-heat on one side, the hand may be held against the opposite side without any unpleasant sensation. On these pillars groined arches or domes would be built, thus avoiding iron floor girders, and reducing iron or steel to a minimum. The chief objection to the steel skeleton framework is the expansion and contraction of the metal when exposed to fire, and the tiles used to cover the steel columns is liable to crack off as the columns expand. On the other hand, it is alleged that the substituted stone columns is quite as dangerous as those of iron, and the arched flooring will be liable to thrust, especially if the columns are widely spaced. We are inclined to the opinion that the success of stone columns protected would greatly depend on the resistance of the protective covering to fire, and that the same protection would afford quite as much security to the iron or steel structure.

BOOKS RECEIVED.

The Future of Palestine, by CLAUDE REIGNIER CONDER, D.C.L., LL.D., Major R.E. (Palestine Exploration Fund, Hanover-square, W.), is a lecture delivered for the Palestine Exploration Fund by the author, who, in alluding to the geographical position of Palestine, which is unchanged, and possesses the same advantages it once did, there being still a range of 10,000ft. from Hermon to the Dead Sea; with varying climates and products, says "the situation, which made Palestine an emporium of the trade of all the Levant when Ezekiel wrote, may again render it the centre of a busy commerce when its resources have been developed by modern science." There is still absence of good harbours. The author is still hopeful, and thinks that the future will see the gradual increase of agricultural population and prosperous settlements, and he thinks the presence of the Turks will not forbid such progress, though it may place obstacles in the way. This improvement will, he believes, not be due to the schemes of individuals, but to the communication of man with man among the humbler classes of Jews and Christians. We recommend a perusal of this brochure.—*Society of Engineers—Transactions for 1891*, edited by G. A. PRYCE-CUXON, secretary (London: E. and F. N. Spon).—In addition to the inaugural address by William Newby Colam, president, which is an interesting summary of engineering progress and discovery, there are several papers of engineering interest. One of these is Mr. G. M. Lawford's paper on "The Drainage of Town Houses," which is awarded the president's premium. We do not agree with the author when he recommends 4in. drains laid at a uniform gradient of 1 in 60, aided by automatic flushing, for all cases, nor do we think that separate cisterns for closet and domestic use are unnecessary, even with valve-closet arrangements. Perfection in these cannot be insured. The paper is worth reading, and is illustrated. The Bessemer premium is given to Mr. J. H. Paul's paper on "Corrosion in Steam Boilers," and the Society's premium to Mr. J. Kerr's paper on "Portable and Pioneer Railways." Other papers include one on "Modern Coal Manufacture," by C. C. Carpenter, "The Balancing of High-Speed Steam-Engines," by Arthur Rigg, &c.

On Saturday two foundation-stones of the new Technical School at Holmfirth were laid. The new school will contain rooms in which chemistry, dyeing, weaving, and designing will be taught, and there will also be provision for the teaching of elementary art. The total cost of the building and fittings will be about £3,500. The architect is Mr. J. Smith, of Sheffield and Holmfirth, and the style of architecture Domestic Gothic of the fifteenth century.

ILLUSTRATIONS.

"PLEASURE," BY W. REYNOLDS.—"WHEN THE WORLD WAS YOUNG," BY EDWARD J. POYNTER, R.A.—"ROSA MYSTICA," BY J. R. SPENCE.—DESIGN FOR CHRIST CHURCH CATHEDRAL, BRITISH COLUMBIA.—CAER-HUN, NORTH WALES.—COATS MEMORIAL CHURCH, PAISLEY.—DESIGN FOR OXFORD MUNICIPAL BUILDINGS.—CONSTRUCTIVE DETAILS OF AN IRON FOOT-BRIDGE.

Our Illustrations.

DECORATIVE PAINTINGS FROM THE ROYAL ACADEMY AND THE NEW GALLERY.

THE reproductions of these eminently interesting pictures are taken of photographs directly produced from the originals. We are indebted to Major Joicy for permission to illustrate Mr. E. J. Poynter's beautiful painting, entitled "When the World was Young," and our thanks are due to Messrs. Cassell and Company for the use of Messrs. Dixon and Son's fine photograph, which the painter kindly placed at our disposal. Of the grace and harmonious colouring exhibited in this masterly work little need here be added to the world-wide approval which has been accorded to it. To the architect particularly, Mr. Poynter's interiors are always interesting. "Pleasure," by Mr. W. Reynolds-Stephens, presents maternal joy and childish delight in the prow of the craft and love reposing in the stern, the whole composition being treated in delicate tints, redolent of summer and the heyday of life, as the calm waters of the peaceful lake reflect the brilliancy of the passing day. "Rosa Mystica," or Santa Maria Vergini, by Mr. J. R. Spence, is a dignified example of strictly decorative painting from the New Gallery Exhibition. The Heavenly Guardians of the Blessed Lady add aerial effect as they hover above in united guardianship over the Christian Throne, behind which a wealth of roses give colour to the setting and illustrate the legend.

CHRIST CHURCH CATHEDRAL, VICTORIA, BRITISH COLUMBIA.

THE exterior of this design was published, with a plan of the building, in our issue for June 3rd, and our illustrations of the other designs were given on May 27th, June 10th, and June 24th last. "Ars" and "Old and New" were, it will be remembered, two of those chosen by the referee for the final choice, which, as yet, has not reached us. "Duomo's" design is marked by a degree of originality which gave the composition a prominent place in the contest, and we considered it worthy of the third place. The inferior now given affords several reasons for this conclusion.

CAER-HUN.

THE subject of our illustration is a view of a residence placed in a most charming situation on the banks of the river Conway. The original building, although old, was quite uninteresting from an architectural point of view, having fallen into a very dilapidated condition, being patched up from time to time, and finally rough-cast externally. The portion to the left, in-

cluding the main entrance, is entirely new, the lower portion to the right being what was left of the old arrangement, which has been renewed and recessed externally. The work will be carried out for Mrs. Hemming by Messrs. Thos. M. Lockwood and Sons, of Chester.

COATS MEMORIAL CHURCH, PAISLEY.

WE illustrate the Entrance Front of the Coats Memorial Church at Paisley, N.B. Mr. Hippolyte J. Blanc, of Edinburgh, is the architect.

OXFORD MUNICIPAL BUILDINGS.

ALL the five designs submitted in the ultimate competition for this important work have been illustrated during the past fortnight in the BUILDING NEWS. We now add a copy of the perspective submitted by Mr. Charles Bell, F.R.I.B.A., showing the grouping and general massing of his design, which depends greatly for its effect on the recessing of the town-hall in the centre of the façade, after the fashion adopted by Street in the Strand front of the Law Courts, for the position of the great central hall.

CONSTRUCTIONAL DRAWINGS.—V.

THIS double-page of details of a timber foot-bridge, comprising elevation, plan, and details, is complete in itself, and requires no further explanation.—STUART H. DAVIES.

COMPETITIONS.

KNUTSFORD.—At their last meeting the Altrincham board of guardians accepted the plans submitted by Mr. Robert J. McBeath, architect, of Sale, in a limited competition, for the enlargement of the above buildings. The work, which will shortly be proceeded with, comprises new chapel and dining-hall, kitchen, stores, &c., and rearrangement and improvement of the offices.

NEW SUNDAY SCHOOLS, JOHN-STREET CHAPEL, W.C.—At a meeting of the trustees, held on the 18th inst., the design submitted by Mr. F. T. W. Goldsmith, A.R.I.B.A., of 1, Verulam-buildings, Gray's Inn, W.C., and marked "Robert Raikes," was selected, and a premium of £5 5s. awarded to a design by Messrs. Keene and Drake, of 41, Bedford-row, W.C., which was placed second in the competition.

SOUTH AFRICA.—The municipality of Cape Town have awarded the premium for the best design of a quarantine hospital for infectious diseases to Mr. Wm. Henry Reid, architect, of that city, formerly of Plymouth, Co. Devon, and London, England. The cost is estimated by Government at £13,000. Details will be given hereafter.

TOTTENHAM.—The Bethnal Green Guardians have decided the competition for the erection of the proposed new workhouse at Tottenham. They have placed Messrs. Giles and Gough's design first, Messrs. Newman and Newman's second, and Mr. Aldwinckle's third.

WALSALL.—Thirty-nine designs have been received for the suggested new town-hall here. It is not proposed to put them on view to other than members of the council, nor it is proposed to employ a professional referee. The council will be aided in their decision, so the town clerk informs us, by the advice of their own borough surveyor, who is a trained architect.

CHIPS.

THE Mersey Docks Board at their last meeting granted the superintendent of their works, Mr. Fielden Sutcliffe, an increase of salary from £350 and £50 bonus to £600 a year.

On Monday afternoon the foundation-stones of the new municipal buildings and free library—which are to be erected in West Ham at a cost of about £30,000—were laid by the Mayor and ex-Mayor.

Mr. H. C. Marks, Assoc.M.Inst.C.E., borough engineer and surveyor of Dewsbury, has recently received two additional appointments, accompanied by a substantial increase of salary—viz., that of water engineer to the Dewsbury corporation and engineer to the Dewsbury and Heckmondwike waterworks board. This latter authority supplies water to the boroughs of Dewsbury, Ossett, and Barnsley, and the local board districts of Heckmondwike, Soothill Nether, Ravensthorpe, Skelmanthorpe, and Flockton.

ARCHÆOLOGICAL.

ROMAN RELICS AT WALLSEND.—A number of interesting relics, dating from the Roman period, have recently been discovered on the land leased by the Corporation of Newcastle to the inhabitants of Wallsend on the small allotments system. Recently a Roman altar, well preserved, a man's head in profile on a plain slab, a square stone with corniced sides, evidently the pedestal of a column, and other fragments, were discovered near the surface. These have been supplemented during the last few days by the discovery of other remains of equal interest. One represents a Roman warrior in a reclining posture, with the figure of a goat on his left. The head of the warrior is missing, and the right arm is wanting below the elbow, the stone upon which the figure is cut being broken in several places. Mr. Blair, hon. secretary of the Newcastle Antiquarian Society, has examined the relic described above, and made a drawing of the figure; but since his visit to Wallsend another carved stone has been found by Mr. Harbottle in close proximity to the place from which the relics previously referred to were excavated. The latest "find" consists of several moulded stones, fragments evidently of a shattered altar. Several pieces to be missing; but 24 letters can be distinctly traced. Nearly the whole of these relics have been found near the same spot at a point distant about one hundred yards from the line of the Roman Wall. Mr. Harbottle, the tenant of No. 17 plot, declares that some nine inches below the surface his allotment is traversed by the foundations of two broad walls, one running from west to east, and the other from north to south. The stones lie in tiers, and are of uniform size, the larger forming the lower layer. A good deal of interest has been taken in the finding of the relics, and several of the allotment holders have expressed their intention of digging in quest of buried treasure in the autumn.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

KENT ARCHÆOLOGICAL SOCIETY.—The members of the Kent Archæological Society commenced on Tuesday a two days' visit to Dover. At the preliminary general meeting, held in the town hall, Earl Stanhope occupied the chair. The members proceeded to view the old Church of St. Mary, where an explanatory paper by the Rev. Canon Puckle was read. Dover Priory was next visited, and, after luncheon, the Castle, the Roman pharos, and the ancient Church of St. Mary's in the Castle were viewed. In the evening Earl Stanhope presided at a dinner in the town hall, and papers were read. The meeting was brought to a close on Wednesday in most unfortunate weather. The early part of the day was spent in exploring the antiquities, chiefly Roman, which have been discovered around Dover, and are preserved in the local museum. The principal place visited was St. Radigund's Abbey, an interesting ruin near Dover. The Rev. G. Livett, Precentor of Rochester Cathedral, acted as guide. The abbey is supposed to have been founded in the 12th century. With the exception of the part used as a dwelling, the greater part of the abbey, including the chapel, is in ruins.

Dr. Ransome, of Manchester, who has just sailed for the Canary Islands, has taken one of Messrs. Baird, Thompson, and Co.'s well-known patent "Grahtrix" drain test machines for the sanitary survey he is to make whilst there.

At the monthly meeting of the Cardiff rural sanitary authority, held on the 13th inst., the building bylaws for the whole of the district of the authority, as amended by the Local Government Board, were agreed to. The bylaws for the regulation of slaughter-houses in different parts of the district were also approved. The surveyor to the authority, Mr. Wm. Fraser, Assoc.M.Inst.C.E., &c., presented plans for the drainage of Ely at a cost of £1,000, which were handed over to a sub-committee.

During the year 16 Methodist chapels have been built, 78 have been enlarged or altered, 12 schools and 3 ministers' houses have been erected. These have cost altogether £40,195, of which sum £24,922 has been raised, in addition to which £24,656 has been paid off from existing debts, making a total raised for chapel purposes of £50,233. The amount spent by the denomination on chapel property from the commencement to the end of last March was £2,109,744, and the present debts amount to £400,000.

WAYSIDE NOTES.

I SHALL really soon become quite enthusiastic about our Progressive County Council. We have only just heard of the proposal to construct a new street between the Tower Bridge and Bricklayers' Arms when the old-standing scheme for Strand improvements is brought forward by the Council's Improvements Committee. This is the sort of progress that one can appreciate. Music for the masses, and like matters, excellent as they may be, and quite the thing for municipal councils, are all very well, but certainly much more so the care of London as a collection of buildings, streets, &c. It is some little surprise to me to see how early the Council has tackled this matter of the Strand improvements, for one was rather prepared for another municipal lodging-house, some scheme for free refreshment for the masses in the parks, or the better administration of tramway property. Here we have it, however, in black and white, that the Council has turned seriously towards the consideration of the much-needed reformation of existing arrangements in the neighbourhood of Holywell-street, and in the way of making better communication between Holborn and the Strand. Bolder still, the Council proposes, or speaks about, a new county hall, "suitable to the Municipality of London"—a genuine "long-felt want."

Of course, the betterment idea is still in the mind of the Council, who stick to the principle with a pertinacity worthy of the cause. Some encouragement has been given to the sticklers for this betterment clause by the result of the General Election. It is hoped that with a Gladstonian Government in power more sympathy with the principle will be shown in the House of Commons. This, I should say, is but a slender reed to lean upon. Blessed is he who expects nothing from Mr. Gladstone. There is, moreover, considerable difficulty in demonstrating how the parties are "bettered." How, for instance, are the Strand shopkeepers to benefit by either one of the proposed improvements? There is nothing to show that a single additional purchaser of any kind of ware will be caused to pass along the Strand by any widening operation. It is not even certain that a holder of property on the north side of Holywell-street would be greatly benefited by the destruction of the block of houses that cuts off the Strand. I should say that the people really "bettered" will be the omnibus companies and other owners of vehicles, cabbies, and all the miscellaneous drivers of vans, carriages, and carts, together with the general stream of pedestrians, all of whom will find it decidedly better when there is more driving-way and elbow room.

If the scheme goes on, I expect that we shall hear a good deal more about the two churches. As a matter of fact, a councillor at Tuesday's meeting alluded to St. Mary-le-Strand as "a church unworthy of preservation," so that all the talk and writing attending the recent discussion about this building has not converted everyone into an admirer of St. Mary's. There are certain to be several coming forward with proposals to destroy both it and St. Clement Dane's. There will be much talk—probably it will be all talk. We have now so frequently seen this question of improving the Strand brought forward only to be set aside again, that one is inclined to doubt the seriousness of any fresh proposal on the subject. There was much antagonism to the scheme evidenced at the discussion, many speakers taking exception to the position of the point where the proposed new thoroughfare is to join the Strand. Time enough yet for a name for this new street; but I quite agree with Dr. Longstaffe, that "The Council Broadway" is, for more reasons than one, a ridiculous proposal.

If the South-Eastern Railway Company are going to rebuild London Bridge Station in a thorough manner, the old shed now used for fruit traffic and for the despatch of children's excursions will be demolished. Here, then, is the opportunity for students of early railway station architecture! The building is the original terminus of the London and Greenwich Railway, the company for which was incorporated in 1833, and the line, something under four miles in length, and costing a million pounds sterling, opened for traffic on the 28th of December of the

same year. On this line, says a guide book to the railway published about the period of its opening, the public may be conveyed on at the rate of twenty to thirty miles an hour, "a velocity almost incredible." It is not unsuitable that this old station should be still in existence on a line of "flying Watkins." It appears that the present shed represents only a portion of the original station, the remainder having presumably been demolished in the construction of the high-level station. The improvements now being made are on the north side of the station, and we may really hope at last that the wretched old felted sheds will give place to the iron and glass structures of the new platforms that have been provided. It is extremely doubtful, however, whether the original building will disappear so long as it holds together over the baskets and boxes of foreign fruit that daily encumber the platforms, and the occasional bands of holiday-making children that may be seen in the summer months.

Bell-ringing appears to have partially destroyed the tower of the old parish church at Great Chishall, Essex. A large part of the massive wall of the tower fell in with a loud crash at an early hour on Tuesday morning. It is said that signs of lateral expansion of the tower had lately been noticed, and on the day previous to the accident a survey had been made with a view of removing the peal of bells, left hanging in a dangerous position after the fall of the wall. Other causes may have been at work, but it looks like a case of bell-ringing bringing down a tower. As a rule an old tower will stand any amount of bell-ringing, where that of a modern competition church would come all of a heap at the first peal.

Very interesting is your account of "An Architectural Tour in 1634." It appeals strongly to one's imagination. The fact that Norwich so early produced tourists interested in architecture is in accord with what one would expect from a city so full of fine old buildings. It would give even a military captain, lieutenant, and ensign a taste for architecture to live in such a place, so we can understand their enthusiasm. I am sure that your readers will look with much interest for a further account of those early travelling students.

An account of an architectural tour quite in the Middle Ages we scarcely hope ever to come across. We have everything to show that such a thing was practically unknown. Yet it would be of wonderful interest to us. We might have some account of the operation of building edifices now crumbling into dust, and obtain much light upon the manners and customs of the builders of those days. It is true that if an architect were recounting his adventures, he might—if there were anything in common between architects, ancient and modern—speak only of edifices old even in his day, and omit to mention the work of his contemporaries. If we reflect a moment, we see how in writing about our modern architectural tours, it is the exception to mention contemporary work. As a rule, the architect seems to greatly prefer writing about ancient buildings rather than about modern ones. It may have been "ever thus," and a writer of the Middle Ages would perhaps have written of the earliest work only and ignored that which was contemporary; in which case, where we might have expected accounts of building a Salisbury or Lincoln Cathedral, we should only be treated to an archaeological disquisition on, say, Norman or Saxon work.

GOTH.

Sir Frederick Bramwell has been appointed by the Board of Trade to act as arbitrator to assess the amount payable by the Council for the purchase of the whole undertaking of the London Street Tramways Company, authorised by their Act of 1870. The inquiry will be opened on Wednesday, the 27th inst., at the Surveyors' Institution, Westminster, but it is understood that the first meeting will be one of merely a preliminary character.

The foundation-stone of stores and offices for the Pembroke Dock Co-operative Society was laid on Saturday last. The building has frontages of 53ft. and 60ft., and includes three large shops, extensive offices, and store-rooms. It is being constructed with Ruabon bricks and Bath stone dressings. Mr. H. Cartwright Reid, of Pembroke Dock, is the architect; and Messrs. W. Davies and Son, of Tenby, have the contract for its erection for £2,700.

Building Intelligence.

LEAMINGTON.—The new wing of the Warneford Hospital, Leamington, has been opened. The recent alterations and additions to the hospital consist of a new wing or ward pavilion, operating room, new sanitary block to old house, additions to the Home for Nurses, re-drainage of old house, and new hot-water supply; and the whole work has been carried out from the plans and under the active superintendence of Mr. Keith D. Young, of London. The new ward pavilion consists of a building two stories high above the basement. On the ground floor is a porch entrance for accidental cases; to the right of the entrance is the corridor leading to the old house, with a staircase leading up to the first floor and down to the basement. In the well of the staircase is a hydraulic lift. Immediately facing the entrance is a corridor leading to the new operating room. To the left of the entrance, a short corridor gives access to the ward and its offices. The two small rooms to right are stores for patients' clothes and ward linen respectively. To each patient is allotted a floor space of about 124ft., and a cubic space of about 1,605ft. The hydraulic lift was erected by Messrs. Archibald Smith and Stevens, of Janus Works, Battersea. The mosaic paving is by Messrs. Burke and Co., of 17, Newman-street, W.; and the staircase ironwork is by Messrs. Richardson, Ellison, and Co., of Brownlow-street, W.C. Mr. E. Atkins was the clerk of the works.

LEEDS.—A desirable improvement is about to be carried out at the corner of Guildford-street and Park-row, Leeds. The old structure is now being demolished, and in the course of a fortnight building operations will be commenced. Designs have been prepared by Mr. Edward J. Dodgshun, F.R.I.B.A. The building will be of the same height as that which it adjoins in Park-row. The sky-line, however, will be broken by two lofty ornamental gables, the tips of which will be some 74ft. from the ground. The frontage to Park-row will be 45ft., and to Guildford-street 33ft. The style is Renaissance, one of the leading features being a turret at the corner, surmounted by a lead dome. The building will be of four stories, and the whole of the accommodation will be devoted to offices.

NORTHBORO'.—A movement is on foot for the restoration of the ancient church of St. Andrew in this village. Mr. G. C. W. Fitzwilliam, of Wilton House, who is joint lord of the manor with the Dean and Chapter of Peterboro', has undertaken the restoration of the transeptal chantry, which contains monuments of the Claypole and Cromwell families, one tomb being supposed to be that of Oliver Cromwell's widow, who died at the ancient manor-house here in 1665. The church is chiefly of the Decorated and Perpendicular periods of Gothic, with traces of Norman and Early English, and consists of chancel, nave with clerestory, aisles, south chantry or transept, south porch, and a singularly lofty gable bell-cot at the west end, supported by tall flat buttresses of the 12th century, and the very fine transeptal chantry before mentioned. There are but few places in England which contain anything so interesting and unique as the remains of the manor house of Northboro', built by Geoffrey de la Mare in 1340, now the property of Mr. Fitzwilliam. It was long the residence of the Protector's favourite daughter, Mrs. Claypole, who died there, though buried in Henry VII.'s chapel at Westminster Abbey.

WOLVERHAMPTON.—On Monday the foundation stone was laid of the institute which is being erected in St. Peter's-square for the use of the parish of St. Peter. The buildings will be two stories in height, and contain on the ground floor classrooms and retiring-rooms, and, above, a large room 67ft. 6in. by 32ft., for assemblies and meetings. The structure is in the Late Domestic Gothic style, and will be built of red brick, with Codsall stone dressings, and covered with slates. The cost of the portion now being erected will be £2,500, exclusive of the fittings and furnishing. Mr. H. Lovatt is the contractor, and Mr. T. H. Fleeming the architect.

Mr. F. Madox Brown is engaged in superintending the scenery, costumes, and decorations required for the representation of "King Lear," the next in Mr. Irving's series of Shakespearian dramas.

BRICKWORK.

IN some of the ruder kinds of early masonry bricks were often employed as mere lacing or stringcourses, to bind together at varying vertical heights the whole of the underlying constituent parts of the masonry; and when so used in the construction of arches (as at Brixworth) in combination with stone, the object of their use with the builders seems to have been to obtain even and equal bedding planes here and there throughout the arch by the insertion, as it were, of bricks or brick courses, irregularly alternating with the rough, unworked, or rudely "scraped" stones of uneven beds, chiefly composing the body of the arch. Bricks are still sometimes so employed, and as inclosures to flint diaper-work, but more in the capacity of ornamentation, and as units or scales of a known dimension to aid the eye in the realisation of the extent and effect of the composition as a whole, than as parts of constructive necessity.

In modern work some of the greatest achievements of engineering skill have been carried out chiefly in brickwork, and in some instances almost to the entire exclusion of the aid of stone. This being so, it will not be out of place to consider the essential conditions of what is now universally accepted as being worthy the name of good brickwork. In the first place, brickwork has made rapid and well-marked strides in the last quarter of a century, or since the decadence of the stuccoed front, and the revival and use of red bricks and terracotta under the sympathetic and able advocacy of our architects and masters of modern refined thought as applied to architecture. Prior to the time mentioned, the shuff, the grizzle, and the rough stock were mostly in demand, but which are now happily supplanted by bricks of a better class and quality, except in the erection of suburban villas and other jerry-built structures. One of the recommending advantages of the use of bricks over stone is the thorough and perfect bonding which may be obtained throughout the mass of the work; the ease and certainty of obtaining solid and homogeneous bedding of the bricks when laid by skilled bricklayers working under the recognised conditions essential to the production of good work. Also the imperishable nature of the material as compared with most of the building stones in use—even the granites. The ease with which they lend themselves to the construction and production of complex forms and outlines under a skilled treatment as compared with the vastly greater expenditure of labour and material required to bring about similar results in stone. Of the importance and necessity of solidly bedding the bricks and effectually flushing up the interior joints (known as cross-joints and wall-joints, no one is so fully alive as the civil or municipal engineer long experienced in the construction or personal superintendence of sewers, waterworks, and hydraulic works generally. The sewers recently built in a western suburb afford a good instance—a case in which the brickwork is so badly executed that to connect the house-drains to the sewers "would be," said the reporting engineers, "nothing less than converting the whole of the inhabited area into a hot-bed of typhoid fever." The question of flushing-up, as applied to a building, differs in degree of importance as applied to a sewer or similar work. Apart from flushing-up the brickwork, as a means of obtaining the maximum amount of tensile strength, in addition to that obtained by good transverse and longitudinal bonding, to carry the loads to which most walls are subjected, and to provide against the possible lateral movement of any of the constituent parts when the whole is under strain, the question has its sanitary aspect also; and by reference to most of the published engineers' pocket-books will be found formulae to find the amount of air in cubic feet which will, in a given time, under certain conditions stated, pass through walls of varied thickness built of different kinds of material. The walls of dwelling-houses, defectively flushed up, are therefore, admittedly, air-filters on a very large scale. They are also liable to be receptacles of damp driven in by storms, and induced by the hollow, or partially-hollow, state of the brickwork, leading up to disease, and in some cases, probably to fatal consequences. The seemingly paradoxical aphorism that "a wet building makes a dry house," is worthy of all acceptance. Walls built wholly of dry or insufficiently-wetted bricks will be found wanting in the two chief characteristics of

good work—viz., solidity, and a firm and binding adhesion of the bricks and mortar. This is nowhere better exemplified, on the one hand, than in old brick footings and walls in situations subjected to the continuous presence of adjacent moisture—many retaining walls, for instance, supporting an undrained or badly-drained bank of non-porous earth—in which case the chemical action set up between the sand-grains and the lime has gone on so uninterruptedly that the mortar has crystallised and attained that condition known to practical men as *water-bound* brickwork. In this condition the mortar, though set, is not hard, and could easily be reduced to a plastic pulp by heating, yet the adhesion between the bricks and mortar is so firm that to separate them is no easy task, the mortar very frequently tearing away with it portions of the bricks at the line of separation, the separation being generally effected by steel-pointed wedges driven by sledge-hammers. The extreme opposite case is that of building walls with dry bricks in the height of summer. The dust coating the bricks is unremoved, forming a separating medium or layer between the bricks and the mortar, and so preventing adhesion. And where dust is not present the moisture of the mortar is taken up with such avidity by the dry bricks that very little or no adhesion is the result, and the mortar, by examination when dry, is found to be little better than a cake of slightly moistened compressed dust. On the other hand, the bricks should not be wetted to the degree of saturation, or they will be incapable of absorbing the finer particles of the mortar into their body, which they should do, forming so many threads binding the bricks and the mortar together. Unless the bricks be well wetted to induce the mortar into the cross-joints and wall-joints during the *modus operandi* of flushing up every course, the work should be grouted. But under any conditions or circumstances the bricks should be wetted before use, except in winter or frosty weather, when the air is generally so humid as to reduce the absorbent power of the bricks. It is, then, advisable to forego the risk of wetting the bricks, especially if the work is in exposed situations.

RAILWAY CHARGES AND EXPENSES.

MR. M. R. JEFFERDS, of 18, Bishopsgate-street Within, has just published a graphic chart, giving the names of each State of the United States of America, and the names of the principal countries of the world; the area of territory, density of population, miles of railway in 1891, square miles of area to each mile of railway; percentage of railways to area, as compared with Belgium, which has one mile of railway to each four square miles of area, as shown by the graduated lines (one mile of railway to four square miles of area equals 100), the heavy lines showing the miles of railway in operation January 1st, 1881, and the open lines the miles that have been built since that date. The blank space between the ends of each line to a point equalling 100 shows the miles of railway that will be required to come up to the present Belgian standard.

The large diagram in its lower right-hand corner shows the average train loads in tons on eight American and two English lines of railway, the general expenses, maintenance of rolling stock, maintenance of way, transportation expenses, and the number of miles of railway operated by each company, from which it will be seen that heavy train loads are much cheaper to move per ton per mile than light ones. Upon the right of this diagram is a scale showing the track or sidings required to handle freight traffic under the practice of the Norfolk and Western as compared with the Midland Railway practice, from which it will be seen that if the Midland Railway Company use the same type of rolling stock that is used by the Norfolk and Western Railroad Company, they would not require over one-half the sidings they now use, or that with their present facilities they can handle more than double the traffic they are now handling. The centre diagram shows the charge per ton per mile, the working expenses per ton per mile, the increase of traffic, and the average train loads upon the New York Central Railroad for each year from 1870 to 1890 inclusive. From this it will be seen that by increasing their train loads from 103 tons in 1870 to 248 tons in 1890, they have been enabled to reduce their working

expenses 52.64 per cent., their charges 59.58 per cent., increase their traffic 393.21 per cent., and pay average annual dividends of 6½ per cent. Upon the left of this diagram will be found a table, giving the average annual wages paid upon the New York Central and London and North-Western Railways, showing that, although the working expenses of the New York Central Railroad are less than one half of those of the London and North-Western Railway, the New York Central pay their employes more than double the wages that are paid by the London and North-Western Company.

The next diagram above that of the New York Central shows the charge per ton per mile; the working expenses per ton per mile; the increase of traffic and the average wagon loads upon the Norfolk and Western Railway in America for each year from 1883 to 1891 inclusive, from which it will be seen that by increasing their wagon loads from 9½ tons in 1883 to 18.11 tons in 1891, they have been enabled to reduce their working expenses 52.63 per cent., their charges 61.43 per cent., and increase their traffic 727 per cent. Now, the question is very pertinently asked by Mr. M. R. Jeffers, How much have the English railways reduced their charges and working expenses during the past twenty years?

CHIPS.

The new tramp wards at Coventry are complete. The new building occupies the site of the burial ground of the old Carmelite Monastery. The architects are Messrs. G. and I. Steane, the builder Mr. J. Worwood, and the clerk of the works Mr. A. Davies.

The directors of the Grafton Galleries propose to inaugurate these galleries by an exhibition of modern pictures, both English and foreign. The buildings, which are between Grafton-street and Burton-street, are now on the high road to completion, and the first exhibition will take place at the end of November or early in December. The collection will not be a loan collection, but will be one of works contributed by living artists. It is also said that the New Gallery is to be occupied during October and November by a picture exhibition instead of the not very successful "Arts and Crafts" Exhibitions.

Memorial stones of new Primitive Methodist Sunday Schools, in course of erection at Wellgate Mount, Rotherham, have been laid. The premises, which include an assembly hall capable of seating 400 people, are expected to cost about £5,000, of which £1,000 has been raised.

The Duchess of Teck opened on Thursday week the Seamen's Institute and Rest, which has recently been completed, in West Ferry-road, Millwall. The building, which has been erected at a cost of about £2,150, including the site, from the designs of Messrs. J. T. Newman and Jacques, comprises two receiving-rooms and a meeting-room on the ground floor, with bedrooms above.

St. Nicholas Cole-Abbey Church is closed for some weeks, in order to carry out the repairs ordered by the surveyor on behalf of the Charity Commissioners. These include the rearrangement of the pews, so as to secure accommodation for about 75 additional seats; the thorough restoration of the spire, and various other internal and external reparation of a less conspicuous kind. The windows are also to be taken out and replaced after some readjustment. This last work will be carried out by the makers of the windows, Messrs. Campbell, Smith, and Co.; the structural repairs by Messrs. Dove Brothers, the whole being under the direction of Mr. George H. Birch, F.S.A., who decorated the church in 1884, and who was recently requested by the rector and churchwardens to supervise the present works.

The Trustees of the National Portrait Gallery have issued their thirty-fifth annual report, in which they acknowledge the presentation of ten portraits and busts, and mention the purchase of fifteen portraits and a portfolio containing twenty-one drawings by Sir G. Hayer.

On the 14th inst. Mr. Rienzi Walton, M.I.C.E., an inspector under the Local Government Board, held an inquiry at Burslem as to the corporation borrowing £9,000 for public baths, £5,000 for the purchase of about 22 acres of land to be laid out as a park and recreation ground, £3,750 for public improvements, and £1,600 for sewage purposes. The borough surveyor, Mr. F. Bettany, described the various works. There was no opposition, and the inquiry closed with a vote of thanks to the inspector.

A new Wesleyan chapel was opened at Brymbo last week. Mr. W. Lloyd Jones, of Bangor, is the architect; and Mr. Charles Burt, of Liverpool, the contractor. The building seats 600 persons.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 382, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) for any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 90c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 80c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLII., XLVI., XLIX., LI., LII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. F. M.—G. and T. R. Co.—Mid-Sussex.—F. B. Maitland.—P. R. F. Co.—F. W. (Kingston).

Correspondence.

HEALTH EXHIBITION IN NOTTINGHAM.

To the Editor of the BUILDING NEWS.

SIR,—Our scheme for holding an exhibition of sanitary appliances in connection with the annual meeting of the British Medical Association in Nottingham, and under the joint patronage of the Association and the Nottingham corporation, seems likely to prove a success. Thirty-six important firms, including Messrs. Allen, Anidjah, Billington, Foster and Cooper, F. Henry Carter, Calvert and Co., Hughes and Lancaster, Jennings, Longford (Bedding) Co., Merryweather, Parkes and Hassall, Stone and Co., Sanitas Co., Tollory and Son, Tylor and Sons, Watts and Whitfield, have engaged spaces and paid their deposits. The stalls are 420ft. in length, and have a uniform width of 8ft. As already announced, the Nottingham corporation have lent the covered and wood-paved yards (measuring 100sq. ft.) at the rear of the Guildhall, and are laying the necessary water mains. The patent jointed drain-pipes of Messrs. Parker and Hassall will be laid under the stalls, and connected with the nearest street sewer. This complete system of water supply and drainage will enable all working hydraulic apparatus to be shown in operation. The President of the British Medical Association, with the Mayor of Nottingham and Sir Walter Foster, will perform the opening ceremony at 11 a.m. on July 26. Certificates of merit in three classes will be awarded to deserving manufacturers or inventors. Twelve representative gentlemen from London and the provinces have consented to act as judges of exhibits.—I am, &c.,

PHILLIP BOOBYER, Hon. Sec.
Guildhall, Nottingham, July 18.

A HINT TO ADVERTISERS.

SIR,—I should be glad if you would inform the tradesmen advertising in your journal that we should be very glad to receive illustrated catalogues of goods suitable for houses, shops, churches, and so forth, with particulars as to prices. At present we have to use fittings, &c., imported by the wholesale houses, which are inferior and not up to date. I may mention revolving shutters, window and casement fittings, decorations, and wall-papers.

Thanking you in advance for what will be a service to the profession here,—I am, &c.,

GEO. A. H. DICKSON, A.R.I.B.A.,
Pretoria Diocesan Surveyor.

Box 1006, P.O., Johannesburg.

Intercommunication.

QUESTIONS.

[10817].—**Showing White Lines.**—A junior draughtsman would like to know the neatest method of expeditiously showing white lines of sash-bars and leads in leaded lights, where glass is shown black, as in the drawings of Mr. Runtz for Oxford municipal buildings in last issue.—A. J. D.

[10818].—**Iron Drains, &c.**—I am architect for some building works in a neighbourhood where I understand that an architect before me has been prohibited by the vestry from using iron drains properly coated inside and out, and now I also am forbidden to use them. Can any of your readers show the justice of by-laws of vestries boycotting properly coated iron drains? Surely there is a sufficiency of opinion in favour of them to justify their use? May I suggest that it is a hardship on the public, and a pity in these go-ahead days (1) that building and sanitary laws and regulations are so inelastic and full of petty details, that they cannot deal reasonably with variations from ordinary cases; (2) that so little is left to the discretion of authorities (with power of appeal in disputed cases), and (3) that said laws and regulations are wanting in loopholes to admit of progress and improvement in existing methods?—A. HENRY FRANK, Gray's Inn.

REPLIES.

[10810].—**Drainage.**—When "Architect" wants information to enable him to win a recently-advertised competition for an Infectious Diseases Hospital, he should consult the various works dealing with such matters, as "Baldwin-Latham," "Humber," and the like, and not attempt to get information cheap, or without taking the trouble to inquire for himself. Is "Architect" one of the competitors at Keighley?—DRAIN PIPE.

[10811].—**Paris.**—The principal architectural papers published in Paris are: "La Revue Générale de l'Architecture et des Travaux Publics" (monthly), "Croquis d'Architecture" (monthly), "La Semaine des Constructeurs" (weekly), "La Gazette des Architectes et du Batiment" (weekly), "Le Recueil d'Architecture" (monthly).—F. E. GAY, Bath.

[10815].—**Building Estate.**—In reply to "N." in your issue of the 15th, some surveyors (1) would do the work for 3s. or 4s. an acre, others would charge as many guineas and be cheaper in the end. You should calculate how long the work will take you, and consider the difficulties on surface. Then fix a price, allowing for assistant or chainman, expenses and materials. In my opinion, a surveyor who understands his business would consider two guineas a day a minimum charge.—U.

[10816].—**Saloon Floor.**—We should recommend McKenzie's patent removable parquet, which is very extensively used, and can be obtained of any first-class decorator or upholsterer.—J. L. AND L.

CHIPS.

A permanent memorial of the late Lord Lytton in the form of a medallion is to be placed in the crypt of St. Paul's Cathedral, and the commission has been given to Mr. Alfred Gilbert, A.R.A.

A large part of the massive wall of the tower of the parish church, Great Chishall, Essex, fell in with a loud crash at an early hour on Tuesday morning. Signs of lateral expansion of the tower had been noticed of late, and on the previous day a survey had been made with a view to removing the peal of bells, which are now left hanging in a dangerous position.

Mr. Henry Stevens, a well-known Eastbourne builder, has just died at Hailsham, after a few weeks' illness. The deceased was 63 years of age.

On Monday Major-General Phipps Carey, R.E., an inspector of the Local Government Board, attended at the Blackpool Town Hall to hear an application for sanction to borrow £11,650 for the purchase of a site for new municipal buildings, and land for street improvements. Mr. Loftos (town clerk) stated that three members of the council had purchased land and buildings adjoining the present town hall for £6,585, and land in Topping-street, for the purposes of widening that thoroughfare, for £5,065. Dr. Jasper Anderson, medical officer of health, testified to the insanitary condition of the offices, and attributed a serious illness from which one of the clerks had suffered to his working in a vitiated atmosphere.

Legal.

CONTRACTORS' RISKS.

THE contracts signed by builders and contractors are a frequent source of surprise to lawyers and others who are not used to the way in which risks are run in the building trades. But the case of "Botters v. Mayor and Corporation of York" (*Times*, July 18, 1892), just decided by the Court of Appeal, brings out so plainly and pointedly the dangers of entering into contract without due inquiry, that it is likely for some time to be a leading authority as well as a standing warning. It appeared that the corporation desired to build sewers along by the banks of the river Ouse, and they obtained tenders for the works, according to plans and specifications and prices, in the usual way. The plaintiff tendered at £55,000, and although he was warned by the corporation that his price was much below all the others, he stuck to it, was accepted, and signed a contract containing all the most stringent possible clauses. The engineer's decision was to be final, and his arbitration conclusive; while the engineer could give verbal orders which the contractor must obey, but for which, although they compelled him to do extra work, he could not obtain payment because they were not in writing.

It very soon appeared that, from the nature of the subsoil, the works could not possibly be constructed by the contractor at anything under three times the price he had accepted. In fact it was almost impossible to build anything in such a mass of mud, and much of the work he did do had to be done all over again. At length the contractor, seeing that he must be ruined if he went on, threw up the contract. The corporation, under their powers, took possession of the works so far as they were executed, and of all the contractor's plant, &c. In the action Mr. Justice Mathews, though he said it was a very hard case, felt reluctantly obliged to find in favour of the corporation on the broad ground that the contractor was breaking his contract, notwithstanding he had made such a foolish bargain. The Court of Appeal in the same way were obliged to confirm this ruling. There was the contract, and it could not be thrown up because to go on with it would have ruined the contractor. The engineer had given orders to do works over again that were rendered necessary by the nature of the soil, and which orders he had a right to give, nor could the contractor legally demand that they should be in writing, so that he could claim payment as for extras. There was thus no legal ground for the contractor's refusal to go on under the contract he had signed, and so he lost his action. It was not proved in any way that the corporation knew how bad the subsoil was, though they seem to have known more than their unlucky contractor, who appears to have made no inquiries into this matter, and who gave himself over bound hand and foot to the engineer.

FRED WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning to insure answer same week.

CONTRACTOR.—CLERK OF WORKS.—Although there is no special clause in the contract as to appointing clerk of the works, it appears that one has been chosen by the building owner and his architect, and that you have for some time worked under him. There is no way by which you can now refuse to have him upon the works, because you have fallen out with him over some details. But you can appeal to the architect, whose agent he really is, against his directions.

LEGAL INTELLIGENCE.

EMPLOYERS' LIABILITY ACT.—CONTRACTOR AND SUB-CONTRACTOR.—(Brompton County Court, before his Honour Judge Stonor and a Jury.—Springett v. Allen.)—This was an action brought under the Employers' Liability Act for compensation on account of injuries received by the plaintiff owing (1) to a defect in the rope attached to a snatch-block used for raising stones and (or) (2) to the scaffolding being too short, so that the rope was unable to bear the strain of raising stones so that it broke, causing injury, &c. Mr. Le Breton, instructed by Mr. Edmund Pooley, of Sloane-street, appeared for the plaintiff, and Mr. Foulkes Griffiths, instructed by Mr. Llywelyn Griffiths, of Harrow, appeared for Messrs. Allen and Son. The case had been heard on April 26, when a verdict

was given for the plaintiff; but a new trial had been ordered. Mr. Le Breton said he would go on the Common Law claim, but would not abandon the alternate Employers' Liability claim. Plaintiff stated that on Nov. 20 he was at work on a scaffold pertaining to the new Walham-green Wesleyan Chapel. While he was pushing the stone, which hung on a chain, in order to get it into position, the snatch-block at the bottom of the scaffolding broke loose. This was owing to there being no sufficient headway for the stone to swing easily. The longer the swing of chain from the pulley, the easier to move for setting. He had asked the chief contractor's foreman to erect a higher scaffold, but he said he was just then too busy. The rope fixing the snatch-block to the pole was quite strong enough, except for this extra strain of pushing. He was bruised when the stone fell, and taken to St. George's Hospital. Cross-examined by Mr. Foulkes Griffiths: He was in the employ of Mosslin Bros., stonemasons; they paid him his wages, and were sub-contractors for the stonework only. The tackle, including the jib fastened to the scaffolding, belonged to the sub-contractors, and was set up by the two labourers working under him. He considered himself under the orders of the chief contractor's foreman. He had left the stone on the pulley all night. He was sure it was not on the strain of the chain, but rested on the scaffold. Edwin John Thomas, the plaintiff's attendant labourer, said that the tackle had been put up by him. He had found the rope on the job; it belonged to Allen and Son. It was about 18ft. long, and was coiled round the pole several times to fix the snatch-block. Cross-examined: He had not asked anyone for the rope. All the rest of the tackle was chain, and belonged to Mosslin. He had brought nothing to fasten the snatch-block, so went in search of a rope. Chains were sometimes used; not mostly. Rope would be liable to influence from rain and frost. The rope was fairly good. He produced part—that part showed a little rottenness; but any rope would get rotten. He had not sworn on the previous hearing that the rope was rotten, and was found on a heap of lime. Allen's man erected the scaffolding for the masons, not for the bricklayers. The front of the chapel was brick with stone facings. This stone weighed about 90wt. The scaffolding was a necessity. The rope would not have snapped if there had been more length of chain at the top to swing the stone. Mr. Mosslin said he was manager of office work for his father. Allen and Sons would, under the contract, be required to provide all scaffolding for the sub-contractor (Mr. Griffiths called for the contract, which was a short memo. signed by Mosslin Bros. without reference to scaffolding). The memo. was only part of the contract; there would be a printed paper, which was invariably sent with their estimates, and this contained stipulations as to the scaffolding. Springett was under the orders of the foreman of the job, Otterwell. This foreman, Otterwell, was Mr. Allen's head man on the job, and Springett would be dismissed by Mosslin if he declined to do the work as Otterwell directed.—His Honour: That only shows that for this purpose Otterwell, who is Mr. Allen's foreman, was also the agent of Mosslin to give orders. As such, Mosslin is responsible for him, not Allen and Sons, for Mosslin chose to put their man under him. The act of Mosslin does not make Allen the employers.—Cross-examined: A claim was made against us by Springett. We referred it to our Insurance Society, and they advised us not to pay. If we had paid they would have recouped the money to us. Springett was foreman, with two labourers under him. All the tackle was theirs except the borrowed rope. The "jib" was a pole from the job like the scaffold poles. Two more scaffold poles would have been sufficient to raise the jib, but his men had nothing to do with that. It would be their business to put up the jib and tackle, and no more.—Re-examined: The erection of the scaffold by defendants would be considered in the estimated price. The other labourer corroborated Thomas, and the "setter" who went on the job after the accident, said that before he worked, the rope was replaced by a chain, and the jib was raised.—Cross-examined: These changes were effected by Mosslin's men in charge of the tackle. He did not know if Springett could have demanded this. Rope was very frequently used to fasten the snatch-block in such cases. For the defence, Mr. Charles James Allen, one of the partners, stated that no printed paper was associated with the contract; but the firm would naturally permit Mosslin Bros. to use their scaffolding apart from any contract. He remembered the night before the accident noticing the stone was left on the chain, and he drew Springett's attention to it. Springett replied: "It is not on the scaffold—it is resting on the chain." This implied that, as it would not injure their scaffold, he need not trouble. A snatch-block ought to be fastened by a chain if the rest was chain-tackle. Cross-examined: The scaffold would doubtless be expected by Mosslin when he sent in the estimate. Mosslin did not mention it specially. They did not usually subtlet their stonework; but in

this case, Mosslin being in the locality, and recommended by the chapel trustees, they did so. Walter Otterwell, foreman of the job, said that Springett never did ask him to alter the scaffold. Springett had two labourers, and they could easily have hitched on two poles and raised the jib. The rope at the bottom was several times complained of, as it ought to be a chain. If it broke, it would endanger the lives of all of them, quite as much as the mason. Cross-examined: He would not object to Springett's labourers altering his scaffold. He would not have deemed it intermeddling. He was sure Springett had not complained to him. Ropes are not often used to fasten snatch-blocks, as the rain swells them. There were two unused small chains all the while in the store-room. Davis, the scaffold foreman, also said he had received no complaints. He did not expect any, as the masons had no right to interfere with the scaffold. They took it as they found it. Defendant's counsel argued that the particulars of claim mentioned a defect in the rope. The rope was clearly supplied by Mosslin's men (of whom Springett was foreman), who elected to use it instead of a proper chain, and the defective rope would imply contributory negligence, even if defendant was liable for the scaffold, "in pari delicto potior est conditio defendentis." This claim was not admissible under the Employers' Liability Act, as "Johnson v. Lindsay" (decided last autumn in the House of Lords) showed that a chief contractor was no employer of sub-contractor's men. There was no contract to supply scaffolding, but only license to use scaffolding erected for the bricklayers and other general purposes. The defendants, as inviters to use the scaffold, were only responsible for the condition of its essential parts—not for the putting of a "jib" too low when a crane might be used, or two more poles put up, by those who put up the tackle. This was a common-law liability. If plaintiff asked for the poles to be raised, he knew of the danger. He also left the stone on the pulley all night, so that until that stone was removed by himself it was impossible to move the jib higher. If the jury thought the rope and the scaffold were both to be condemned then they would clearly say so. Mr. Le Breton made a forcible appeal to the jury. His Honour put the following questions to the jury:—1. Did the accident occur through a defect in the rope? 2. Did the accident occur through the scaffolding being too low? 3. Did it happen through both these causes combined? 4. Did the defendant agree to provide scaffold for the stone masons either by implication or in writing? 5. Did the defendant merely provide scaffold for the bricklayers and all parties? 6. Did the plaintiff fully know the risk and accept the work? 7. Did the plaintiff apply to Otterwell to raise the scaffold, and was Otterwell foreman over him? Mr. Griffiths asked that a question as to the personal knowledge of Mr. Allen might be put as under the common law; knowledge of the foreman was not enough. The judge thought this not needful. The jury after some deliberation returned to court with affirmative answers to all the questions except the fifth. Verdict was claimed for the defendant, and at once so ordered. Mr. Foulkes-Griffiths said they would not press for costs beyond the return of what was paid into court for the new trial.

CLAIM BY A PLYMOUTH BUILDER.—Before Judge Edge and a jury at the Stonehouse County Court last week, James Prout, carrying on business as a builder at Cecil-street, Plymouth, sued his mother-in-law, Margaret Toblicock, of Grosvenor-street, Plymouth, for £6 8s. 10d., balance of work done and goods supplied. In 1885 the defendant instructed plaintiff to knock off the old plastering of the house in which she lived, and to plaster it with Portland cement. This was done, and a charge of £16 14s. 6d. made. Defendant expressed her satisfaction with the work when completed, and it was only twelve months ago the defendant complained that the work had not been properly carried out. There was a counter-claim for £8 7s. 3d., which defendant alleged was due to her as damages for negligence in the work done by the plaintiff. Plaintiff stated that he did the work according to the agreement. The work was properly carried out, and the charges were fair. Mr. J. L. Hodge, surveyor of the Stonehouse Local Board, and Mr. A. R. Lethbridge, builder, Plymouth, stated that they had examined the plastering, and were of opinion that it was good. The charges were fair. The defendant stated that the plaintiff told her the work would remain good for twenty years, and had promised to complete it for £12. Messrs. S. Harvey and W. H. Taylor, builders, of Plymouth, were of opinion that the stucco was not good, and that the work had not been properly carried out. The jury found for the plaintiff on the full amount claimed.

CHURCHWARDEN'S RESPONSIBILITY FOR REPAIRS.—**BUTLER V. PEMBER.**—This was a motion for a new trial before Lord Justice Lindley, Lord Justice Lopes, and Lord Justice A. L. Smith. The plaintiff was a builder, and the defendant, who was a house and estate agent, acted as a churchwarden at a proprietary chapel known as Christ's Church,

Carlton-hill, St. John's Wood. The plaintiff sued for a sum of £164, the cost of repairs and alterations to the church, which, he said, had been ordered by the defendant. It was agreed at the trial that only the question of liability should be then tried, and that, if necessary, the builder's account should be referred. The defence set up was that the orders were given by the defendant as agent for the incumbent, and that therefore the defendant was not liable. When the repairs were started the incumbent was Bishop Richardson (a Bishop of the Protestant Episcopal Church in America). He, through the defendant, subsequently sold the chapel to a Mr. Tully, a clergyman of the Reformed Episcopal Church in America, and, partly owing to the purchase-money not having been paid, the Bishop had had to file his petition in bankruptcy. The contract of purchase provided that the new incumbent should take over the liabilities of the church improvements, and the defendant said that the orders he gave subsequent to the sale were given on behalf of Mr. Tully. The plaintiff produced his books showing that he had a private account with the defendant, and that the church account had been opened in the name of "Pember, Esq." There was considerable conflict of testimony as to who had given what orders and as to the precise language used. The action was tried on June 23 and 24, before Baron Pollock and a special jury. The jury found for the plaintiff. On June 27 Baron Pollock entered judgment for the plaintiff in accordance with the verdict, and referred the amount to an official referee, and he refused to grant a stay of execution. The defendant now moved for a new trial, on the ground that the verdict was against the weight of evidence. The Court dismissed the application. Lord Justice Lindley said that this was eminently a case for the jury. The action was for labour done upon a church which, when the work was commenced, belonged to Bishop Richardson. He sold it during the progress of the repairs to one Tully. The evidence was unquestionably conflicting, but it was clear that the plaintiff did the work at the request of somebody. The plaintiff swore that the only person from whom he received orders was Pember, and the jury believed him. Pember acted as churchwarden, and it was obvious that he took a great deal of interest in the matter. This case was not even near the line. There was ample evidence to justify the jury in finding that the only person to whom the plaintiff looked for payment was Pember. His Lordship was inclined to think that the verdict was right. The application failed. Lords Justices Lopes and A. L. Smith concurred.

A BRIDGE BUILDING CASE.—**SMITHSON V. THE WIGTON HIGHWAY BOARD.**—Plaintiff in this case was Richard Smithson, builder, of Workington, but late of Ireby, and defendants were the Wighton Highway Board. The plaintiff claimed £13 balance of the agreed price of building a bridge at or near Snow Hill, Caldbeck, over the Ellerbeck, on or about the month of August, 1890. In the alternative plaintiff claimed the like amount *quantum meruit*. Mr. T. Hodgson appeared for plaintiff, and Mr. Gibson for the defendants. A counter-claim of £50 was filed by defendants for improper construction. The Judge of the Wighton County Court gave judgment for plaintiff for the full amount claimed, with costs.

ALLEGED ADVERTISEMENT FRAUDS.—A tall Yorkshireman, described as a builder and engineer, was charged at Westminster Police-court last week with obtaining money by false pretences by way of advertisements in London and provincial newspapers. In the charge-sheet prisoner's name stood as John West. He is said to have adopted aliases of "Wilson" and "Vernon." Prosecuting for the Treasury, Mr. Sims said the prisoner was charged with conspiracy with a man named Humphreys to defraud a number of persons by pretending to engage them as timekeepers and clerks on building estates, which he alleged he possessed at Surbiton, Putney, and elsewhere. Six cases would be gone into, in which the prisoner obtained nearly £700 from poor fellows who were led to intrust him with money through his specious advertisements. Some of the victims had parted with the whole of their savings, and had been left penniless. The man Humphreys, his brother-in-law, was convicted at the last Old Bailey Sessions for complicity in the frauds, and was sentenced to twelve months' hard labour.—Martin Sherman Kerry said in November, 1891, he was living at Eye, Suffolk. He had a sum of £300 left him by his mother. In response to an advertisement for a timekeeper he got into communication with the prisoner, who represented that he was building extensively at Surbiton and other places. Prisoner also represented that the situation vacant was one of trust, and in the end witness parted with £250 as "security." After giving his money he went, at the prisoner's suggestions, to his City offices in Featherstone-buildings, High Holborn. The name on the door was "The Lost and Found Key Society." Witness's chief occupation was answering letters and applicants in response to periodical advertisements which were inserted for people wanting situations. A cash security was re-

quired, and the prisoner told him to engage anybody who could deposit £75. Witness only knew of one *bona fide* business transaction at the offices—the purchase of a large load of bricks. Some of the advertisements offered large interest to people who would invest their money—15 per cent. monthly. There was some excavation commenced at Surbiton, but it was stopped almost immediately. There was nothing there but a few pails and a wooden hut. Prisoner cross-examined witness with a view of showing that he (prisoner) was carrying on a genuine business, and that it was owing to circumstances over which he had no control that he was unable to fulfil his engagements. The hearing of the case was not concluded; but witnesses already examined were bound over to appear at the Old Bailey.

A LEEDS ARCHITECT INSOLVENT.—A meeting of the creditors of Samuel Smith, architect, surveyor, and valuer, Leeds, was held at the office of the Official Receiver, Park-row, Leeds, last week. The debtor's liabilities amount to £95 5s. 3d., and there are no assets. None of the creditors were present, and no resolutions were passed.

RIGHT OF ACCESS.—**RAMUZ V. SOUTHEAST LOCAL BOARD.**—The plaintiff is the owner of land at Southend conveyed to his predecessors in title in 1866 by Mr. William Wagstaffe, the deed of conveyance describing the land as being bounded on the south by the public Promenade-road bounding the shore of the river Thames. He further contended that the effect of this conveyance was to vest the property in the soil of the public Promenade-road—now known as the Esplanade—in his predecessors in title, that such property was now vested in him, that any title of the local board to the Esplanade existed under conveyance from persons claiming under Mr. Wagstaffe, and that the board were therefore estopped from saying anything except that the soil of the Esplanade was vested in the plaintiff, subject only to the rights of access of the general public to such Esplanade as a public highway, which, he alleged, existed as such from prior to the year 1866. Under these alleged circumstances the plaintiff alleged that in December, 1890, a fence was erected by the board, partly on the plaintiff's land, and partly between such land and the Esplanade, whereby he was deprived of direct access to the Esplanade. To prevent the continuance of such fence he claimed an injunction, he also claimed damages. The local board said that the Esplanade was not a public highway, but a pleasure ground vested in them for the purpose of being so used under their control for the benefit of the inhabitants of Southend; that the fence was erected wholly on their land for the preservation of the pleasure ground, and that the plaintiff had no right of direct access from his land to the Esplanade, his only right of access being that which he possessed in common with the other inhabitants of Southend. Mr. Justice Romer delivered judgment last week as follows:—The plaintiff is entitled to succeed in this action. It is clear that his land comes down to the very edge of the public promenade. If the fence erected by the defendants is not on the public promenade it is on the plaintiff's land, and the defendants were wrong in placing it there. On the other hand, if the fence is on the public promenade, then also the defendants were wrong, for that promenade is a public highway for foot-passengers, and it is settled law that a man owning land which runs right up to a highway is entitled to access by that highway from his land. I need not refer to authorities for this proposition of law, nor, indeed, was the general proposition actually challenged by the defendants' counsel, but reference was made to the case of "Lyons v. Fishmongers' Company" (L.R., 1 App. Cas., 662), and it was suggested that this case threw some doubt on the proposition where the owner of the land was not also presumptively owner of the highway immediately adjoining. But "Lyons v. Fishmongers' Company" threw no such doubt. On the contrary, if the judgment of Lord Justice Mellish is carefully looked at, it will be seen that he fully recognised the law to be settled as I have stated. All that was decided in that case was this:—The access of the plaintiff in that case to the river highway had been stopped by statutory authority which took away the public rights without compensation, and only provided for compensation being paid where private rights were interfered with. The Court of Appeal held that the plaintiffs in that case had no private rights interfered with, but this was overruled by the House of Lords. But, though admitting the general proposition of law, and that the public promenade had been dedicated to the public and was a highway, the defendants' counsel contended that the dedication was limited in such a way as to justify the defendants' action in putting up the fence. But I can find no evidence of any limitation. The promenade has been for years and is used over every part of it by the public as of right without regard to their object in using it. It has been for years and is always open for foot passengers at both ends, night and day, and constantly used not only for strolling up and down, but for going

from Southend to Leigh, and from Leigh to Southend, and even if it had only been used as a promenade, yet, as the public right would extend all over it, I cannot see how the defendants could now take away a strip of it by putting a fence on it, or why it was not still a highway to which the plaintiff had right of access from his land. Some suggestion was made at the end of the argument of the defendants' counsel that there might be some part of the promenade at the side not used by the public, and the fence may have been placed by the defendants on this part. But I can find on the evidence no ground whatever for this contention. The promenade is used by the public over every part of it without limitation, and, as I before remarked, if this fence be not on the public promenade, then it is clearly on the plaintiff's land. This renders it unnecessary for me to decide whether the plaintiff is not also entitled to succeed on the ground that the promenade is admittedly erected on the foreshore, and that under the conveyance to him of his land he is entitled to access to the sea over the promenade. It follows that the plaintiff is entitled to a mandatory injunction to compel the defendants to remove the fence, and, as he has suffered special damage by the defendants' acts, he is also entitled to an inquiry as to the amount of that damage. Costs to the hearing. Subsequent costs will be reserved, and there will be liberty to apply as to payment of damages and subsequent costs, and generally.

ERECTING WOODEN STRUCTURES WITHOUT LICENSES.—The proprietor of Parke's drug store, Rye-lane, Peckham, was summoned, at the instance of the London County Council, on Tuesday, for having erected a movable or temporary wooden structure without having obtained the license of the Council. Mr. Burton appeared for the Council, and Mr. C. F. Gill defended. Mr. Burton said the structure in question consisted of a wooden frame, with glass centre, and fixed upon the parapet of the shop, and supported by iron rods. Mr. Parcial, one of the surveyors under the County Council, produced a plan, showing the nature of the erection. In cross-examination, the witness said he could not say whether this was the first case of the kind brought before a court. No inhabitant had, so far as he knew, complained of the erection. He believed it was first mentioned by the district surveyor.—Mr. Gill said what was complained of was nothing more than an ordinary signboard, and contended that it did not come within the section of the Building Act under which these proceedings had been taken.—Mr. Burton, on the other hand, urged that it did. Mr. Hopkins said it appeared the complainants had found they could not get at the matter under the Signs Act and had fallen back upon the Building Act. He agreed with the view put forward by Mr. Gill, and, therefore, dismissed the summons. Mr. Burton asked the magistrate to grant a case.—Mr. Hopkins said he could not do that. Mr. Burton could apply for a mandamus.—Mr. Burton said he should decline to do that.

CONTRACTORS' REFUSE.—**ALLHUSEN V. VIGERS.**—The plaintiff, who had recently purchased a residence, known as Twyford Abbey, near Ealing, applied on Saturday in the Chancery Division for an interim injunction restraining the defendant, a dust contractor, from causing a nuisance by an accumulation of refuse in the vicinity of the plaintiff's residence. The defendant denied the nuisance, and it was suggested that it might be attributed to other smells existing in the neighbourhood, which was a convenient one for nuisances. His Lordship said that there was no such thing at law as a convenient place for nuisances. The plaintiff had a strong body of direct evidence to support his case, and had made out a case which entitled him to an interim injunction. The defendant, however, was merely carrying on his business, and it was not, therefore, right that the interim injunction should be made to operate at once. That being so, he granted an interim injunction restraining the defendant from causing the nuisance by smell, but the operation of the injunction would be suspended for three weeks. The action would be set down for trial as once on the issue of nuisance or no nuisance.

STYLES AND SONS V. CROFT.—The plaintiffs, a firm of builders, last Friday, in the Queen's Bench Division, before Mr. Justice Wright, sued the defendant, a wine merchant, carrying on business in Water-street, City, to recover £65 18s., balance of an account for work done at the Pelican Club, Gerard-street, Soho. The plaintiffs' case was that a contract was entered into by them with the defendant, as the proprietor of the club, to do certain repairs and make alterations at a cost of £263. They carried out the work, and there was an amount of something over £30 of extras. The contract was entered into through Mr. Waters, an auctioneer and surveyor, at the time in the employ of Messrs. Giddy and Giddy, house agents, and it set out that it was entered into with the defendant as the proprietor of the club. Mr. Waters, moreover, gave a certificate for £230, which had been paid in the name of Mr. Croft, and this was paid by

a firm of solicitors to whom it was said defendant referred the plaintiffs. The defendant's case, however, was that he was merely acting in the matter for his brother-in-law, Mr. H. E. Wells, who was said to be the real proprietor of the club. The defendant said he never had any interest whatever in the club, and was unaware of the fact that his name appeared in the contract or certificate. The solicitors who paid the amount specified in the first certificate were Mr. Wells's solicitors as well as his own. He denied that he had ever stated that the club belonged to him. The Judge said defendant did not allege that he gave Waters to understand that he was acting on behalf of Mr. Wells. Under these circumstances, although very likely Mr. Croft did not know his name was in the contract as a principal, he was liable, whether he was the real principal or not. Judgment would, therefore, be given for the plaintiff for the amount claimed, with costs.

BUILDINGS IN BACK GARDENS AND THE BUILDING ACT.—At Hampstead, on the 13th inst., Mr. John Bishop Hutchins, a builder, of Wanstead, Essex, was summoned by Mr. William Smallpiece, the London County Council's district surveyor for East Hampstead, for having erected a greenhouse at 12, Downshire-hill, Hampstead, without first giving notice to the district surveyor in accordance with the Metropolitan Building Act. There was also a summons against the defendant for contravening the Building Act by the manner in which the greenhouse was erected; but that was not proceeded with. Mr. Smallpiece, the district surveyor, said he "discovered" this building (the greenhouse) in the garden of 12, Downshire-hill, no notice having been given to him of its erection; but the defendant had since explained to him that he was not accustomed to building in London. The defendant said it was a portable greenhouse, 10ft. square. Replying to the Bench, Mr. Smallpiece said that no one really had a right to put up a wooden dog kennel, or a fowl-house, or a bicycle shed, without first giving notice to the district surveyor and obtaining his consent. Defendant said he was quite ignorant about having to give notice. The Bench inflicted a nominal penalty of 1s., with the cost of the Court, and 5s. costs for the district surveyor. Mr. Smallpiece withdrew the other summons against the defendant, as he had promised to amend the erection in accordance with the Building Act.

CONTRACTORS' RISKS.—**BOTTEMS V. MAYOR AND CORPORATION OF YORK.**—(Court of Appeal, before Lord Esher, Master of the Rolls, Lord Justice Bowen, and Lord Justice Kay.)—The hearing of this case was concluded last week by a judgment for the corporation. It was a case raising in substance the question whether the contractor or employer must bear the burden of an enormous increase of expense caused by the muddy and unstable nature of the soil, which neither party had tested or inquired into, and it will be seen that the Court determined in effect that the contractor took the risk of it. The plaintiff had entered into a contract with the Corporation of York to construct sewers along the banks of the Ouse according to certain specifications and plans, and at certain prices for the measured work, measured as completed. By the contract, as usual, the sewers were to be constructed to the satisfaction of the engineer, and the power was reserved to him to vary or extend the quantities of the work, to alter the line level or portion of any work, to increase or change the size, character, or kind of the work, and the contractor was not to have any claim upon the corporation for any such variation or extension, other than for the work actually done, according to the prices of the contract. And if the engineer used the power thus reserved to him, or ordered the contractor to execute the work by day work, an order in writing was to be given to the contractor to that effect, and any works executed under such order shall be paid for at the rates set forth, and orders given verbally are to be regarded as instructions for the execution of the works included in the contract, and no timber used and left in the work was to be paid for unless ordered to be left in by the engineer. And if the contractor did not execute the works in a sound and workmanlike manner, or neglected to amend inaccurate work to the satisfaction of the engineer, the corporation might give the contractor notice to proceed with the due and proper execution of the works, and if he failed to do so, then the corporation might terminate the contract and take possession of the plant of the contractor, who was to have no certificate for payment until he had finished work to the satisfaction of the engineer to the amount of £2,000, the total amount at the prices fixed being £55,000, and in case any dispute arose the engineer's decision was to be final. The contractor, on the contract being entered into in March, 1891, commenced the work, but it was found the soil was of so muddy a nature as to require a great deal of propping by timber to prevent it from falling, and so the work was executed under great difficulties and at a far greater expense than contemplated; indeed, the contractor stated (and, as the learned Judge said, correctly) it would cost

three times the amount of the estimated expense. Under these difficulties, however, in June he had completed 136ft. of the sewers, and, as was admitted, this part was well executed by him. But, as he alleged, the pressure of the muddy soil on each side altering the size of the sewer, the engineer, or one of the inspectors under him, again and again required the work to be cut out and done in another way, which was done, the contractor said, more than once without orders in writing. On June 9 the engineer again required him to cut out and reconstruct a part of the sewer completed, which he refused to do unless ordered in writing and paid for extras. This was not agreed to, and on that day he stopped the work and withdrew his men, on which the corporation, having given him notice under the contract, put an end to the contract and took possession of the contractor's plant. He then brought this action, which was tried before Mr. Justice Mathew without a jury, and he came to the conclusion, though very reluctantly, that the corporation were entitled to judgment. It was, he said, a hard case; the contractor had made a very foolish bargain, but he was bound by it. According to the law lately laid down in the case of "De Morgan, Snell, and Co. v. Rio de Janeiro Flour Company" (8 the *Times* Law Reports, 292), the engineer in such cases was the arbitrator, and his decision was final. It was quite clear the effect of the contract was to deprive the contractor of any right to claim in respect of extra work upon the footing that the work had been varied unless he had the written order of the engineer, and it was entirely in the discretion of the engineer whether he would or would not give written orders. The learned Judge, therefore, gave judgment for the corporation, and the plaintiff, the contractor, appealed. The Attorney-General (with Mr. Raikes) appeared on his behalf, and argued in support of his appeal. He was heard at some length on Friday, and on Saturday continued his argument. Mr. Lockwood, Q.C., who appeared for the corporation, was not called upon. Their Lordships, without hearing him, came to the conclusion that judgment must stand for the corporation. Lord Esher in giving judgment said, however they might regret it, they were bound to give judgment against the contractor. He had entered into a contract which he found he could not carry out—that is, without being ruined—and he threw it up without being entitled to throw it up. The real reason why he had come to grief was that he had not ascertained the nature of the soil before he entered into the contract. In consequence of the nature of the soil the engineer gave orders which he was entitled to do, without any extra payment to the contractor. The contractor demanded written orders on which he would be entitled to be paid. That was refused, and then he threw up the contract. He was not entitled to do so, as he was not entitled to demand written orders. He had failed to show any legal ground for throwing up the contract, and he threw it up wrongfully, on which the corporation exercised their right to put an end to it and to take the contractor's plant. The contractor must take the consequences of the imprudent contract he had entered into. The judgment of the learned Judge, therefore, in favour of the corporation was right and must be upheld. Lord Justice Bowen concurred. The real reason, he said, why the contractor threw up the contract was that he found that if he carried it out he would be ruined. He saw that ruin stared him in the face if he carried it out, and so he threw it up, but that he had no right to do. There was no ground tenable in law on which he could throw it up, and he had thrown it up for a reason on which the law did not allow him to do so—that is, on a demand that it should be modified. Lord Justice Kay also was of the same opinion. Though, he said, he had the greatest possible sympathy with the contractor, he saw no ground on which it was possible to relieve him, as it was clear that he had made up his mind to throw it up unless it was modified. Judgment for the corporation affirmed and appeal dismissed.

STATUES, MEMORIALS, &c.

DUBLIN.—Two works by Mr. Albert Bruce Joy were unveiled at Dublin last week. The first was a bust of the late Provost Lloyd in Trinity College, and the second a bust of the late Dr. Robert McDonnell in the board room of the Royal College of Surgeons.

The National Provident Bank of England, Newport, Mon., is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, the same being supplied by Mr. E. H. Shorland, of Manchester.

At the Poplar Cottage "Hydro," Matlock Bank, a new wing has been added to the premises, comprising thirty bedrooms, a large drawing-room, and a billiard room. About fifty workmen and invited guests sat down to a splendid spread at the finish, the chair being occupied by Mr. Jesse Davis, and the vice-chair by Mr. C. Newbold, of Belper, the architect of the works.

Our Office Table.

THE retubing of the streets for the electric lighting by the City of London Electric Lighting Co. is a slow and most inconvenient process, which the patient London citizen has to endure as well as he is able. The tubes or channels are of different kinds—one is of triangular-shaped section, made of a bituminous composition, bored by three apertures; the others are iron tubes of different diameters, and these are packed close together and laid in a trench below the foot pavement. But the points to notice are the twists and bends that are required to clear the gas and water-pipes and other connections to the houses, and the necessity of having to bend the channels and tubes out of a straight course—a labour that absorbs time and greatly inconveniences pedestrians. Why not lay down brick or concrete channels, and cover them in a manner that they can be opened and closed expeditiously?

Those who knew Arundel-street, Strand, but a few years ago will be surprised to see the transformation that has taken place. It is now lined by a row of stately blocks of offices and chambers of red brick and terracotta, and architects who come up from the country and wish to see the progress made in terracotta-architecture, will find a variety of design in Arundel-street; bays recessed and projecting, mullioned and traceried; arcaded treatments of façades, pilasters, corbels, and gables, and chimneys and every kind of relief ornament. The workmanship and jointing of the arches and mullions are in some instances very superior. Surrey and Norfolk-streets will no doubt soon follow the example, when the new thoroughfare contemplated from the Strand to Holborn has been decided upon.

SIR E. W. WATKIN writes to the *Times* in support of his scheme for a tunnel to connect Ireland and Scotland. He says:—One great thing they (the Government) could settle—a question more important to Ireland, as it seems to me, than a dozen Home Rule Bills—a question which can be discussed quite apart from Home Rule controversies—I mean the restoration of prosperity and progress by great, but simple, public works—the leading works being (1) a ship canal of capacious dimensions between the west and east of Ireland, and (2) a tunnel from the north of Ireland to the south of Scotland. The former would place Ireland on the shortest sea-road to all the great West, and to the East via the Canadian Pacific Railway, and the latter would make Ireland and Scotland one country. Surveys and discussions to which I and others have for years been parties have demonstrated the feasibility of both projects, and the most liberal estimate for both does not exceed £20,000,000, which at 3 per cent. 99 years' terminable security would amount to a burden of £600,000 a year for 99 years, or about a fifth of the cost of keeping a hostile force in Ireland. I shall be happy to show to any one the plans and sections of a canal across Ireland prepared for me under the charge of the late Mr. T. A. Walker, who constructed the Severn Tunnel, and most of the Manchester Ship Canal.

In a paper read before the Washburn Engineering Society of Worcester, Mass., Mr. E. F. Miner gives results of some important experiments on the holding power of anchor bolts in stones. For the purpose of the experiments tap bolts were prepared 1½ in. in diameter and 9 in. long, with a thread 6½ in. long, and were set into the stone 6 in. The holes in the stone were as nearly as possible 2 in. in diameter and 6½ in. deep, but in three of the experiments they were tapered to a diameter of 2½ in. at the bottom. Using an inferior grade of Babbitt metal, the bolt came out 1½ in. under a load of 10,000 lb., due to the stone and metal coming to a fair bearing. At 15,000 lb., however, it drew ¾ in. out of its setting, and at 16,000 lb. the stone split. With lead setting, the lead being melted and poured round the bolt resting in a tapered hole, an extension of ¾ in. was noted under a load of 2,500 lb., which did not increase till the load was raised to 5,000 lb. Above 6,000 lb., and up to 13,000 lb. an extension of 1½ in. for each 1,000 lb. was observed. Putting on power, the load was then rapidly raised to 33,000 lb., when the lead gave way. With lead pipe setting in a straight hole, an extension of ¾ in. was noted at 4,000 lb., which did not increase till a load of 5,000 lb. was reached,

but beyond this each successive increment of load produced an extension. On applying power the load was raised to 5,000 lb., when failure occurred. The best results were, however, obtained with sulphur setting. Thus in a straight hole with this material no yielding whatever was noted up to a load of 10,000 lb., above which, however, it was perceptible, though up to 29,000 lb. it was only ¾ in.; beyond this no measurements were taken, but at 31,125 lb. the stone split. The fragments of sulphur from the broken stone showed no signs of crushing. With the same material in a tapered hole no movement of either bolt or setting was observed up to a load of 20,000 lb., but on leaving this load on for five minutes, an extension of 1½ in. was noted, which, however, did not increase during the rest of the experiment. At 29,000 lb. one of the iron clamps cracked off a corner of the stone, and at 31,515 lb. one of the iron straps holding the stone broke and ended the experiment. With the metal settings there was a very perceptible movement of the setting under a low load, which was probably due to the contraction of the metal on cooling.

In his annual report to the town council of West Hartlepool, Mr. J. W. Brown, the borough surveyor, says the officials have been in considerable tension in endeavouring to keep abreast of the works rendered necessary by the extraordinary road development. Since Mr. Brown's appointment in 1884, nearly one hundred streets, or portions of streets, have been constructed, the population has increased from 30,000 to about 44,000, and the rateable value by over £30,000. Much activity has been displayed, he says, during the year in the building trade; 211 dwelling houses have been certified for occupation, as against 129 in the previous year. The total number of new houses, alterations, and additions, erected and made during the year, is 396, as against 179 the previous year. He has asked the town council to appoint a building inspector, remarking that he knows of no other town where the increase of the population is so rapid where they have not such an official.

The Mayor of Plymouth (Mr. F. W. Harris), in his presidential address to the second annual meeting of the Devon and Cornwall District Council for the National Registration of Plumbers, held last week at the Plymouth Technical Schools, said he was glad to know that they were determined to discourage all tinkering in the plumbing trade. Let them endeavour to do their work in an expeditious and thorough manner, and their employers and those who employed them, through their masters, would desire that they should be sent where important work was needed. They were now recognised as one of the most important trades, and the public generally were beginning to see and to feel that good plumbing was necessary, and he did hope that each one of them would take pride in his work. He was going to say, and he thought he did say, when he was there a few months ago, that it was being looked upon as a profession, and if they would just feel that each one of them was engaged in a trade that was fast becoming a profession, it would lift their thoughts and actions, and they would feel that they were very important persons. In the Council's annual report read at the meeting it was stated: The Council believe their present register is, on the whole, very fair to the qualified members of the trade, and a guarantee to the public that those plumbers in Devon and Cornwall who are entitled to assume the letters R.P.C. are trustworthy and competent tradesmen. There is every reason to believe that as the public becomes better acquainted with the movement the benefits of the registration system will be so apparent that those persons holding certificates will be selected in preference to others not so qualified.

In response to an appeal from the North of England District Council for the National Registration of Plumbers, the County Councils of Northumberland and Durham have decided to afford facilities for a few operative plumbers, selected from different centres in the two counties to attend the special course of instruction in the "Principles and Practice of Plumbing," which will be held at the Durham College of Science, from Monday, August 22nd, to Saturday, September 10th. The object of the course is to train duly qualified plumbers in the methods of teaching, in order that they may eventually conduct classes in their own localities for the benefit of apprentices who are working

for the examinations for registration under the Worshipful Company of Plumbers. From the two counties twelve men will be selected, and will probably receive an exhibition not exceeding £5, to cover their expenses during the three weeks and free admission to the course of instruction.

THE total amount realised by the sales at the London Mart during the half-year ending the 30th ult., according to the *Estates Gazette*, was £2,384,172—a sum greatly in excess of the amount realised during the same period of the previous year, when the figures were £2,022,951. In the year 1890 the amount reached was £2,047,518. While the number of freehold houses in London have decreased, the sale of leaseholds has increased by over 600. Building plots in the suburbs, and especially those near railway stations, have been more in demand, and amongst the miscellaneous sales some very high figures have been paid for public-houses, although the purchasers will have to wait several years before they obtain possession of them.

A CORRESPONDENT of the *Iron Industry Gazette* says:—Tools, like men, grow "tired." I have seen a first-class chisel get "tired," and act as though it was possessed of the King of Sheol. It would not keep its edge, and the more I sharpened it the sooner it would lose its edge. I called the attention of a shopmate, a grizzled old veteran, to the peculiar behaviour of the chisel. He looked it over and handed it back to me, saying, "The tool is all right, only a little tired. Lay it away, and let it rest. It will come out all right again, just like a man who is tired. I did not believe the old fellow, and I really thought he was crazy to talk of a tool getting tired, but as there was no help for it the tool was laid away. I do not remember how long it was left to "rest," but when it was again sharpened and used it appeared to hold its keenest edge as well as it did before it got tired. Barbers tell me their razors in constant use get tired in the same way, and wood-choppers say their axes sometimes seem to get "soft" all at once. Possibly constant and hard usage may cause changes in crystallisation that would account satisfactorily for the peculiarity alluded to. Locomotive engineers often observe peculiar misbehaviour in their machines, which may possibly be the result of continued heating, friction, and pounding. When a tool gets "tired," or a machine "bulky," give each a rest.

THE Chairman of the Committee of Improvement of Highways of New York is offering three prizes for the best three essays by European engineers on "The Practical Construction and Maintenance of Country Roads." The prizes are respectively £21, £14 14s., and £6 6s. The articles may be written in English, German, and French, and may contain not more than 20,000 nor less than 8,000 words. Good illustrations, either drawings, engravings, or photographs, will be especially important. The essays should be sent to the chairman before the 31st December next, and the prizes will be awarded on or before March 1st, 1893.

THE new harbour works at Dover are to be commenced next week, the conditions under which the contract for £400,000 was accepted last week being that the work should commence within 14 days. The construction of the eastern arm is expected to take six years, during which it is estimated that £20,000 a year will be spent on labour alone, as all the concrete blocks will be made at Dover. After the construction of the eastern arm, a breakwater will be built, and the harbour will then accommodate the largest liners afloat.

MR. H. DAWSON BARKAS, Head Master of the Reading School of Art, has issued a pocket manual for students, giving suggestions of an elementary kind, and furnishing hints for the use of those learning shading from the cast. The letterpress is arranged in the form of questions and answers, and marginal illustrations accompany the text as practical demonstrations of the rules laid down. The author claims for his method that it is calculated to lead the student to think and exercise those powers of observation in matters of detail which will conduce to a truthful representation of the objects he studies, both in *realism* and *appearance*. Materials and apparatus, ever dear to the beginner, are illustrated and described, as well as the methods of applying them. Light and shade, contrast, technique, cast shadows, and local tones are decanted upon, and then follow a

series of sketches and more finished studies compared. This technical pocketbook seems well adapted for school of art pupils and all students learning to draw on South Kensington methods.

WATER SUPPLY AND SANITARY MATTERS.

BURSLER.—Last week Mr. R. Walton, C.E., held an inquiry at Burslem into the application to borrow £9,000 for the erection of public baths, £5,000 for the purchase of land for the purposes of public walks and pleasure grounds, £3,750 for purposes of street improvement, and £1,600 for purposes of sewerage works. Mr. F. Bettany, the borough surveyor, stated that the site of the baths was in Moorland-road. The plans included two swimming-baths, one having a water area of 60ft. by 30ft., and a capacity of 50,000 gallons, and the other 73ft. by 33ft., holding 69,600 gallons. Sixteen private baths would be provided, 12 for males and 4 for females. Extra care had been taken to insure superior Turkish baths, which it was generally admitted had become a necessity to the working potters. The various fittings and appliances of the baths would be of the most improved patterns. The council had been long desirous of providing a recreation ground for the town, and in consequence of inquiries after a suitable site, Messrs. Wood, who gave the site for the baths, offered them a decided bargain. It was a piece of land in Moorland-road, 52 acres in extent. They put a value of £6,000 upon the land, but offered it at £5,500, and intimated that £500 of this sum might be considered as a contribution towards the cost of laying out the ground. With respect to the street improvement loan, the town clerk explained that the council had purchased certain property which had come into the market, and it would enable them to effect a most desirable improvement. A portion of the land had been since re-sold by the council to Mr. Dobson for £2,600, leaving £1,050 to be paid on the original purchase, and £100 further was required for laying out the road and footpaths. The £2,600 would not be paid until Dec. 26. The last question inquired into by the inspector was a proposal to lay an intercepting sewer, at a cost of £1,600, to divert the sewage of the Pinnox Estate, Brownhills, from the Foulhay Brook. The town clerk said the County Council had pressed this work upon them in order to keep the Foulhay Brook—which was a tributary of the Trent—free from pollution. There was no opposition to any of the proposed loans.

Trade News.

WAGES MOVEMENTS.

BOLTON.—The lock-out in the Bolton building trade is at an end, and the men resumed work on Tuesday. The plumbers struck ten weeks ago on the question of winter hours of work and allowances for country work. The Masters' Federation have conceded that in winter the men should commence at eight in the morning, as against seven in other months. The other matters in dispute are referred to arbitration.

THE CARPENTERS' STRIKE AT BELFAST.—The London carpenters and joiners have unanimously decided to make a levy that will realise at least £350 per week, in support of the carpenters and joiners on strike in Belfast, such levy to be continued until the termination of the strike.

STATE OF THE SKILLED LABOUR MARKET.—The memorandum prepared for the *Board of Trade Journal* by the labour correspondent to the Board of Trade states that during June industrial conditions have been less disturbed than in the month preceding. Neither in point of number nor of importance have disputes been so serious, and there has been a falling off in the number recorded from 93 in May to but 59 in June, while the number of persons involved is only about one-third of the previous total. The trades at present furnishing the larger proportion of these stoppages of work are the textile and building trades. In the textile industries 15 strikes have taken place during the month, but these are not of much importance. The building trades of all branches have been unusually active, and are responsible for 12 strikes, while many movements for increased wages or lessened hours of labour have been arranged without cessation of work. Dock labour and ship-building trades are, on the other hand, accountable for six and five strikes respectively, most of which are defensive rather than aggressive in character. There have also been nine among coalminers, and the balance are spread over miscellaneous industries.

TAUNTON.—The carpenters and joiners of Taunton have resumed work after having been on strike for ten weeks. They demanded 6d. an hour, being a rise of 1d. The masters offered 5½d., with 6d. next year; but this the men declined. The men have now accepted 5½d., with a promise of the additional farthing next month.

Holloway's Pills.—A course of this admirable medicine clears the blood from all impurities, and improves its quality. The whole system is thus benefited through the usual channels without reduction of strength, shock to the nerves, or any other inconvenience; in fact, health is renewed by natural means.

ESTIMATES GIVEN ON APPLICATION.

DOULTING FREESTONE.
THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—
THE HAM HILL STONE COMPANY
NORTON, STOKES-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 25, Fritch-street, Soho, London, W. Established 50 years.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*. Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BIRMINGHAM.—For erecting eleven cottages at Strichley-street, near Birmingham, for Mr. A. R. Gibbs. Mr. Francis B. Andrews, A.R.I.B.A., architect:—
Grant, H., Selly Oak £2,269 0 0

BIRMINGHAM.—For erecting twenty-seven cottages in the Elm Tree-road, Strichley, near Birmingham, for Mr. Grant. Mr. P. A. Blenkam, architect:—
Grant, H., Selly Oak £3,750 0 0

BROMLEY, KENT.—For works of kerbing, channelling, paving, &c., in Oaklands-road, for the Bromley Local Board. Mr. Hugh S. Cregeen, surveyor:—
Hudson £1,316 13 11
Lansbury, T. 1,294 19 6
Mowlem and Co., J. 1,175 0 0
Peill Bros. (accepted) 1,141 5 0
Surveyor's estimate, £1,289 13s. 4d.

BUSHBY, LEICESTERSHIRE.—For the erection of a residence, for Mr. J. E. Kirby. Messrs. Miles and Beasley, Leicester, architects. Quantities by architects:—

Blair, T., and Son	£3,470 0 0
Bentley, S. and H.	3,419 3 11
Tyers and Yates	3,254 10 0
Hutchinson and Son	3,244 13 0
Clark and Garrett	3,234 0 0
Mason and Sons	3,179 0 0
Sharp and Neal	3,172 8 0
Herbert, T. and H.	3,165 0 0

THE CLIENT AND THE ARCHITECT.

THE business transactions between owners, builders, and tradesmen which the ordinary practitioner has to conduct are so varied and numerous that it would be beyond the scope of an article like this to discuss them. We say the "ordinary practitioner," because architects who stand at the top of the profession have of necessity very little to do with business details, these in the main being left to their chief assistants, to the clerk of works, or solicitor of the client. In the natural order of things the professional man is first consulted; to him the client confides his proposals, the limits of expenditure, and it is for him to suggest the ways and means and method of proceeding. He has, therefore, the "key" to the position, and the question may be raised here whether he uses it with discretion. Too often the position is compromised or quite lost beyond recovery. All that is thought about is the instruction and the commission; the mode of carrying out the design does not trouble, it is a matter of routine; the whole transaction is arranged in a perfunctory sort of manner. The client fancies his architect knows what he wants; the latter thinks whatever he does will be acceptable. Here the first mistake is committed. Very different ideas possess the minds of each probably; the building owner has no very clear conception of what he wants, and probably the most crude and elementary ideal of a building is in his mind's eye. Of course the misunderstanding is unfortunate, and must in the course of the work render negotiations difficult. A little more tact may be exercised by the architect at this stage. He may draw out his client's views on paper, or if this is impossible, owing to his client's incapacity to express his want, an actual example may be pointed out. Example may be better than precept, for opinion may change and can be denied, but an actual building is in evidence. Even with a working example before one's eyes, it may be desirable to make particular note of any deviation that the employer desires. The size of rooms and their finish ought to be pointed out, and the differences defined, or the impetuous client, especially if a lady, may declare that the model has not been carefully followed, or that the new building is inferior. Definite instructions upon questionable points put into writing would save an immense deal of trouble. Upon these data the architect might proceed to make his plans with confidence. How often do we hear the remark about a suggestion that has come from the employer, but is disappointing in execution: "Oh, yes; but I left you to advise me—I did not know the effect," and after the architect had strongly advised another plan. If any definite instruction is given after the evil has been pointed out, it ought at once to be reduced to writing.

From the question of estimates the architect naturally shrinks. However rough or approximate an estimate may be, it pledges him to an outlay which may not be borne out, and yet it is a question which cannot be hoodwinked. It is a custom nowadays to know the cost: it means so much capital extracted from the business or the revenue of the employer. No doubt, from a purely professional point of view, it appears unnecessary to require the cost of building, when the absolute requirements are fixed and a properly-prepared bill of quantities

is made out. No responsible agent would allow his employer to pay one shilling more than is necessary for the due execution of the work. No lawyer or medical practitioner is asked beforehand how much his fees will be or the costs of an action. Why should an architect alone, of all professional men, give any guarantee of cost? On the other hand, the expenditure in building is generally much heavier, and there are often quite as many leakages and contingencies as there are in law proceedings and taxation, and these are expenses which the employer expects to be prepared to meet. How to prepare approximate estimates of cost that may be relied upon is not a duty that forms any part of the young architect's curriculum. All he can do is to "cube," or lump together, the trades. Possibly someone who has made estimates and quantities a special study may some day propose a more exact scheme of estimating on calculated results of existing buildings than that of taking the floor area, or the foot cube, or some other unit. Only the practical man is able to form an estimate by taking the quantity of brickwork in the lump, and the flooring with approximate accuracy, and roofing by the square, for such a wholesale mode of taking the materials and labour is rather risky. The price per unit can only be obtained by a careful analysis and experience of local labour. Whatever may be the trouble in acquiring the art of estimating, we cannot underrate its importance, both in giving confidence to the employer, and in being a useful guide to the architect. The practice of under-estimating is one to be reprehended in a professional man who has no gain to make out of the building, except it be in the shape of his commission, and as this has to be added to the cost, it is safer and more honest to state a sum that will cover it. The tender comes in afterwards, and if the lowest exceeds the architect's estimate by a large amount, the owner at once thinks that his architect has been misleading him. Far better that the estimate should be in excess of the lowest tender, or even of the highest, as then it enables the architect to recommend the acceptance of a builder who will do justice to the work. Nothing is gained by appearing to accommodate oneself to the situation, of satisfying the owner's parsimony at the real expense of effectiveness, of, in short, "holding with the hare while running with the hounds." The shilly-shally policy is dangerous, and has never been found to answer in transactions of this kind.

It is at an early stage of the architect's engagement that he should endeavour to make some agreement between himself and his client. The general idea is that the building contract is enough, that it binds all three parties, that the clauses framed by the architect or legal representative can be made sufficient to bind the employer to the acts of his architect, and although this is true up to a certain point, we have constant evidence of disputes between architects and their clients as to deviations, extra work, and especially as to the granting of certificates, questions which the Courts sometimes construe very differently to the intention of the framers of those documents. The law sometimes regards a clause as unreasonable, and the client may decline to be bound by any decision given by the architect in favour of the contractor as provided for by the arbitration clause. For these reasons an agreement between the architect and his client is necessary. The document should state distinctly what the architect agrees to do, in short, what his duties are, the amount of his commission, how additional expenditure or extras are to be paid for, the mode of payment, whether the plans are to be retained by the architect or not, his power as arbitrator in case of disputes with builder, and any other special matter. Or if

an agreement is not made, the architect should write a letter to his employer in which these questions are set forth. In the absence of any objections on the part of the client, the letter would possess the binding effect of an agreement. We do not think this mode of settling conditions is often adopted, perhaps through an idea of offending the owner; but any letters written at this initial stage might be made useful in the way we have indicated. Simple statements of what the architect intends, if left unanswered, remain as terms of an implied contract. Thus an architect can incidentally mention how the clerk of works is to be paid, the terms of payment to the quantity surveyor, the fees payable in respect of professional services if the work is not commenced within a specified date. These terms may merely recite what the client and architect have verbally agreed to at interviews with one another without taking any formal shape liable to give offence. Too much is left in ordinary transactions to the mutual good faith of the parties, and to verbal understandings. Alterations to plans and specifications are made without the signature or assent of the client in writing, and upon this very fluctuating and worthless sort of evidence the work proceeds, till some unhappy difference makes it only too obvious that client and architect have not understood one another upon questions of vital importance to the carrying out of the contract.

NATIONAL COMPETITION OF SCHOOLS OF ART.

THE designs and drawings which have received medals and book prizes are now on view in the galleries at South Kensington. Eight gold medals, 49 silver medals, 140 bronze medals, besides 340 book prizes, are awarded in addition to the honorary awards to students of the training class, while the number of works sent for examination comprises 50,311 from 251 schools of art and branch schools, 41,306 from 309 science schools, and 16,785 from 333 art classes. Of these, 3,217 works have been selected for competition. The recipients of the gold medals represent Birmingham, Canterbury, Clapham, Glasgow, Leicester, and South Kensington, and only one student, Charles R. McIntosh, of Glasgow, gains it for an architectural design, namely, for a chapter-house. This design was submitted, under the motto "Griffin," among others, for the late Soane Medallion prize, a notice of which competition we gave in our issue of Jan. 22 last, page 122, Vol. LXII. Mr. McIntosh's design is octagonal in plan, and is of the Italian Renaissance character. The drawings treated exhibit considerable skill and taste, and the details are commendable.

Amongst the special architectural designs we must mention those for a church. James H. Tonge, of York, whose work we have before referred to, is awarded a silver medal for a design of considerable artistic ability in a Late French style, and showing some quaintness of treatment in the two porches at the south transept and western end. The windows have circular heads filled with Late tracery; the plan of five bays, with tower, transepts, chancel and ambulatory, morning chapel, &c., is carefully disposed and proportioned, and there is a porch and tower vestibule at west end, and cloisters along the south side. The tower is shown finished with a low parapet, and the east end and transepts are treated with artistic feeling. The ink drawings and study of a side of chancel show a master's hand, and the cross-section exhibits a double wall with clerestory arcing instead of the usual lean-to arrangement.

W. Carter and Ernest H. Bird, also of York, receive bronze medals for a town

church design: the former has an octagonal-ended apse, and with details of Late Gothic. The drawings are well executed, and a low unfinished tower at west end is shown. The second is also of similar character. With the exception of faults of detail and construction and a want of proportion in the lights, these drawings indicate a more rational instruction in church design than formerly, and a marked advance upon the elaborate and grandiose cathedral craze which we have been accustomed to see in these annual competitions, and have from time to time reprobated as a subject for students.

Henry Mitchell (Glasgow) receives a bronze medal for a Classic steeple, which we did not see. The examiners say that the 5ft. walls of the upper part are needlessly heavy—they bear on arches which would be unsafe. The large circular-headed windows of the lower part are also said to be too large, the reversed console termination of buttresses is inartistic, and a too high point of view (80ft. above ground) is chosen. A design for a public day-school, by John H. James, Cardiff, wins a silver medal. A Late Gothic brick and stone treatment, with tower and entrance, and a plan disposed round three sides of a playground, characterise this design, which would be certainly better with a less conspicuous tower, if one were wanted. The same prize is awarded to W. Jones, Leeds, for a design for a pair of cottages for a mountainous district, stone and timber being the materials used. They are semi-detached, and the plan good. The porch at the corner with single column is very effective. A design for an artist's house, by Heber Rimmer, Chester, whose work is always pleasing, receives a bronze medal for a clever Late Gothic treatment, well grouped with wide window-bays, and having some good points in the plan; but the hall is large, and the office block rambling. The gallery is badly lighted. A museum and art gallery, by Eric A. Sutherland, Glasgow, takes a bronze. It is rather heavy Classic; but the plan is suitable; the same medal also goes to a Sydney Technical School student, R. E. Nancarrow, for an Australian residence in a Palladian style, with verandahs or arcades and a low roof. These attempts show an appreciation of Italian architecture, and it is evident that the New South Wales architects are partial to Classic. Other designs not exhibited receive book prizes. In a country subject to great heat the verandah has been found a valuable addition. It is a pity a more picturesque and pliable style has not been introduced; but the materials available have not been as yet passed through the crucible of an inventive artist's mind, and are still in the hands of those restricted to the schools.

The measured drawings are rather poor; the subjects chosen in many cases are not of sufficient merit to copy, and there is a want of practical knowledge in the details, such as jointing of masonry and mouldings. A silver medal is won by Ernest W. Light, Winchester, for measured and coloured drawings of the Norman font in Winchester Cathedral—a very fine example of Norman *circa* 1129, with elevations of the four sides and the sculptures in relief; also by Archibald Knox, Douglas, for set of drawings illustrating chapels and other historic remains, of Celtic crosses and their ornament, commended by the examiners. Another is awarded to John L. Smith, Birmingham, for drawings of Aston Hall, the side entrance and details of staircase; and a third medal to Benj. J. Fletcher, Leicester, for drawings in India ink and pencil of church door of St. Maclou, Rouen, showing the carved panels and bronzes executed by Jean Gougon. Bronze medals are given to Ernest R. Davis, Leicester, for some rather poor measured drawings in pencil of buildings; to W. F. Edwards, Birmingham, for wall arcing and crocketed pinnacle to Lady-chapel,

Lichfield Cathedral; to Harry P. Clifford, Rochester, for carved oak fireplace from Eastgate House; to C. J. Hair, Peterborough, for window in Claypole Chapel, Northborough Church, N. Hants; to Chas. Holloway, Nottingham, for drawings of Brant Broughton Church, Lincolnshire. Book prizes are awarded to Herbert Barkas, Reading, for a carved old oak screen in Hurst Church of the 16th century; to W. H. J. Allen, of same town, for screen in Warfield Church, Berks.

In the designs (stage 23c), Gertrude Roots, Canterbury, a well-known lady designer, takes the only gold medal for a mosaic pavement, a design marked by an artistic arrangement of Byzantine motive and harmonious blending of colour of a low key. Amongst other bronze-medal designs we must name that of Ella B. Ginn (Hertford), for wall-tiles and a Persian arrangement by Charlotte Trower, of same school; another tile panel by Edith Aird, Canterbury, nice in colour (blue and yellow); a clever pattern (349) by a Hertford student. The wall papers are not satisfactory. The silver medal is given to Robert Dow, Glasgow, for a printed hanging of a much too naturalistic kind. There is no attempt made to conventionalise the animals, birds, and foliage on the green ground, and a want of ornamental arrangement is evident. Mary M. Hastings, Chelsea, has a design for surface decoration, fir-trees, cones, and bats, cleverly treated for colour; a bronze is awarded. G. Anderson, Coventry, takes the same prize for a wall-paper design, boldly treated, with birds introduced. The designs for these purposes show that their authors have not yet mastered the essential principles of ornament when applied to flat surfaces, and the natural forms introduced in many of the wall papers show a loss of sight of their ornamental characteristics, or those peculiarities which ought to have been turned to account by the artist. Birds and other animal forms should be more cautiously introduced. We must notice a clever wall fountain and glass mosaic panel in marble by C. Oppenheimer, of Manchester, which only takes a book prize. Designs for decoration of rooms are very inferior. A. Norris, Sheffield, sends an over-panelled treatment, and the billiard-room decoration by a Manchester student is commonplace.

Carpets and cretonnes is another group which shows a falling off in quality. A bold peony pattern with leafage is shown by W. E. Sands, Nottingham, for a cretonne, and wins a bronze medal. Agnes Farman, Leicester, has a design for a stair carpet in which the running centre pattern of foliage is clever, which takes a bronze medal; and a Macclesfield student, F. H. Smith, shows a harmony of colour and a clever centre pattern or filling. In cotton and silk hangings, a silver medal is taken for a silk damask by E. Preston, and there are a few conventionalised and clever designs, such as that of Mary Mohun, Canterbury, which displays an artistic discernment in the entwined lines. A bronze medal is given. Canterbury is to be congratulated on the number of students that have taken gold and bronze medals for designs—all lady students. A Blackheath student also sends a clever treatment (76).

The designs for pottery include a design for a plate, by Flor. Morris, of Hertford School, especially the border, the centre squirrel is too naturalistic. It receives a silver medal. The border is skilfully designed. Edith Thorp also wins this prize for a painted plaque Classically treated. The designs by J. B. F. Hiles, of the Training Class, South Kensington, are well worthy of the silver medal. His ewer and dish are graceful and Classical in taste, and it may be worth mention that this student has lost his arms and legs, and has to design and draw every-

thing by a pencil placed between his teeth. Another ewer and dish, by C. Ripper, may be noticed for its gracefulness in outline.

The designs for ironwork are not numerous. A silver medal goes to a set of cleverly-drawn designs for signs in wrought iron and copper, and a series of gates and grilles of different styles by H. Pepper, and a bronze to B. Fletcher, Leicester, for a newel and baluster in wrought iron.

The design for a panel of cabinet by W. M. B. Kean, Leek, illustrative of the "Lady of Shalott," in water-colours, is an artistic work, and displays a poetical feeling in the drawing and colour worthy of the great poem of Tennyson. The designs for book illustrations, Christmas and invitation cards are worth attention. Gertrude Bradley and Winifred Smith, Birmingham, take the gold medals for illustrative designs for children's nursery books and verses, and silver medals are awarded to Agnes Manley and Mary Jane Newill, of the same school, for some clever book and card illustrations. Other students of the school take bronze medals, amongst them F. Mason and Florence Rudland; and we must also mention the clever designs for stained-glass windows, figure subjects, and skilful border by Mary J. Newill. Other designs and drawings we must reserve. The examiners of the architectural designs are Professor G. Aitchison, A.R.A., T. G. Jackson, A.R.A., Mr. J. Stevenson; and W. Morris, Lewis Day, Alan S. Cole, and F. Shields are the examiners in the other designs.

JAPANESEQUE.*

I HAVE been very severely and very properly called to order by the learned Secretary of this Institution for coining a new word, "Japanesque," to meet the exigencies of the occasion of my appearing before you. But the word "Japanese" has already three uses. It is both singular and plural, applying to one and to all the inhabitants of Japan; and as an adjective it is applied to the products of the islands, connoting probably some slight idea of artistic excellence. I could not very well append to these a fourth use, applying it to things in the Japanese style, to things "Japanesque" in fact, because, as I shall endeavour to show you this evening, it could not in such use connote any idea of art at all; it would, on the contrary, connote a great deal that is terribly inartistic. Therefore, again craving your pardon for having coined it, I will use the word Japanesque to signify, not the European facsimiles of Japanese work, which are indeed fairly well executed, but a certain bastard form of ornament which has seized on our art wares, and which has derived some sort of inspiration from Japan. The history of the rise and progress of Japanesque is well-known in the potters' trade: I believe that the precise date of its first appearance has been chronicled on the sherds which form the archives of that trade. For this reason my examples of Japanesque will be drawn from plates, the decoration of which indeed, holding as they do no unimportant place among our household gods, is a matter of considerable interest. But it will probably not be necessary for me to point out that the potters having once set the example, as indeed they have done in decorative art through many centuries, Japanesque has been adopted by the carvers, the weavers, the broderers, and the candlestick-makers. I shall endeavour to point out to you the chief points in which Japanesque misses the mark, commits unpardonable sins against the art of Japan. If I should conclude with a panegyric on that art itself, I trust you will find me sufficient excuse. Here are some Japanesque plates, the designs upon them are as far removed from Japanese as this Island of Fogs which has produced them is from the Islands of the Sun. And yet, no one who is familiar, as who amongst us is not, with the crude formalities of true Victorian decoration, with the parodies of the Renaissance grotesques with which so much of our street architecture is plastered, no one but can fail to discern in these extraordinary designs

* A paper read before the Royal Institution of Great Britain by Mr. F. T. Pigott.

a striving after something new, an effort to be original, a desire to shake off the fetters of formalism and pseudo-classicism. You will not need, I think, to be reminded that these plates are fair samples of a species of art-work with which we are now familiar; nor will you fail to recognise the cause which called these artistic strivings and desires into being. A light had dawned suddenly on British artists in design, at a time when they were beginning to weary of the stencil plates and tracing-papers which are the handmaids of formalism. That light dawned from the far Eastern islands of Japan, which, though their existence had been long known, were for us practically discovered not more than forty years ago. And in the pathway of this light there came these revelations, which to the designers of those days must have been simply startling: that it was not then essential to good ornament to divide a circle into eight, sixteen, or thirty-two parts, in each of which the same amount of pattern was to be stencilly repeated; that it was not then essential to find the true centre of an object, and fixing a flower there to let all the stems radiate from it in ordered arrangement; that it was not then essential to make everything balance truly from that centre, of equal size, and at equal distances. In the work which came from Japan these and many other traditional rules which we deemed to be of the essence of art were cast to the winds, ignored in most insolent fashion: and yet the work was strangely delightful: had a grace of infinitely more charm than anything our traditions had ever produced for us: revealed a feeling of proportion and balance whose laws, it indeed there were any, were wrapped in deepest mystery. The effect of this on the Western workman was strange. Broad and pleasant paths of artistic wickedness seemed to open straight before him: to walk in them, he forsook the narrow path which his education bade him follow; he, too, would cast his traditions and his stencil-plates to the winds. And when he had so done his work became sprawly, his designs began to lack unity, he cultivated irregularity, and in proportion as he developed these peculiarities his execution deteriorated: a dabby, spotty eccentricity pervaded everything he did. The great art-spirit of the Japanese had been true to the first of artistic principles: she had concealed herself. Without any very great attempt to track her to her hiding-place we contented ourselves with a poor parody of her, and formulated a style which has no laws to guide it, and which for want of a better name I have christened *Japanesque*. I think I am not exaggerating when I describe the result as execrable; nor in saying that the revelation which came with the dawning light was startling am I using a mere rhetorical figure of speech. *The Times* of 1854 contains an account of one of if not the earliest exhibitions of Japanese things in London. A certain Dutch merchant, "wishing to ascertain whether the taste of the English nation was in accordance with the works of Japan," held an exhibition in Pall Mall in January of that year. *The Times* wondered "whether the same thing would happen to the Japanese as had already happened to the Hindoos, whose art work had been depreciated by the stupid conceit of the European, who must needs tie down their exuberant fancy to his own meagre or vulgar designs. . . . Such delicate and beautiful ornamentation had never been seen in the same perfection in this country. . . . Our papier maché manufacturers ought to feel themselves under special obligations to this Dutch merchant for enabling them to see how immeasurably the artisans of that barbarous island [as we thought it then] excel them." Thus *The Times*; and I have heard too how in this theatre, very nearly thirty years ago, the audience was so enraptured with a lecture delivered by Mr. Leighton on Japanese art, and with the objects he exhibited, that it was past midnight before this staid Institution could close its doors. I may at once attack one of the chief vices of *Japanesque*, which is an abortive attempt to grasp one of the leading characteristics of Japanese work; it is the fragmentary spray work with which our pots, and pans, and plates are nowadays ornamented, the angulate sprig of flower or fruit which comes from nowhere in particular and sprawls everywhere in general. Without putting you in darkness again let me picture to your mind's eye a very familiar dessert-service, the shape of dishes and plates unexceptional, the price a sum

unmentionable, the colour a greenish-grey, which is itself but a weak vibration of the pure celadon of the East. Thereon struggle various boughs and sprays of flowers coming, "*à la Japonaise*," from beyond the edge, with birds hovering about them. But the drawing of these birds is horridly impossible, and as to the proportion between them and the flowers, why, either they must have been snared in Lilliput, or the flowers culled in Brobdingnagian gardens. But even this is a small matter compared with the execution of them. The whole subject is first drawn in black outline, and the petals, stalks, and leaves simply dabbed or splashed with colour. This is not an unfair description of average *Japanesque* work. Now the points which the draughtsman fights for, on the supposed authority of Japanese art, are: visible irregularity of design coupled with haphazard composition; a suggestion of an invisible shrub growing somewhere, which has allowed one of its branches to trail across the plate; and a sort of conventional naturalism which serves as an excuse for hasty and poor workmanship. In this respect, indeed, his work does not approach even that of those palmy old days of British art when the potters painted just in the centre of a plate a posy of flowers as like to nature as they could make them. The Japanese work which this feeble stuff attempts to copy belongs essentially to the domain of pictorial art, and is governed by the same laws as the pictorial art of Japan. The greatest purist among decorators would never deny that pictorial art may very properly be applied to the purposes of decoration; but he would insist, and rightly, that when it is so applied it should conform to the principles of pictorial art, and must be judged by its standards. A base form of pictorial work, work without artistic vitality, is not to be tolerated merely because technical difficulties stand in the way of getting good execution on clay. If I paint a landscape on a potter's vessel I shall not be forgiven its crudity, its lack of depth and light; nor if it be a human face, its vacuity, simply because of the difficulties which my materials set in my way. Admittedly the work is much more difficult than if I painted my subject on paper or canvas; but art is power, and if it succeed, I may look for greater praise for my picture, because of the great technical difficulties which I have overcome; but the attempt to overcome them was of my own seeking, and if I fail, I cannot insist that, by reason of these technical difficulties, my art finds legitimate expression in a lower range of feeling. Nor, again, for art is long, can the length of time which work would occupy were it well done be an excuse for doing it badly. Is it essential to my happiness to cover my walls with red roses and ribbons, and my ceilings with chubby cupids and all the winged hierarchy of artistic space? I may do so, and infringe no real or imaginary law. But the cost, if it be the work of men's hands, or the difficulty of getting good results, if it be processed, will not be an answer to kind friends who tell me that my variegated patches of colour are hideous and mere nothingness, or that my cherubs are up aloft in positions of anatomic impossibility. Decorative art in its lowest form supplies the means of obviating those terrible productions in which our fathers of an age not so long past seem to have delighted. Let me turn your attention now for a moment to the pictorial art of Japan. Much of it depends for its charm on the simplicity of the means by which it produces its effects. It reveals in suggestion. The works of one of the greatest of its schools is in great part in monochrome. The treatment of leaves and flowers often approaches very closely to the conventional treatment necessary to ornament. In these simply black and white pictures much of the detail, even of the foreground, is left to the imagination; the middle distance is veiled in a misty cloud; the distance is suggested by a few delicate, almost disappearing, touches. Now the technical difficulties in the way of executing pictures such as these in materials less easy to manipulate than ordinary pigments are obviously much diminished. The canons of the art can be observed as faithfully by an artist working with lacquer and gold dust as by one who uses water and Chinese ink. The wood-carver and the metal worker, the embroiderer and the dyer, know that the masses of colour which their materials produce may be made to correspond entirely with the masses of full tone in a picture. Again, that wonderful dexterity of workmanship, which surpasses all we have even

dreamed of in the West, looks upon the hammer, the chisel, the needle, the knife, as no less facile instruments for producing sweeping swelling lines than the brush. And, yet again, whether they work with liquid pigment or stiff enamel, with threads of silk or with metal inlay, all craftsmen alike possess a complete mastery over the gradation of their tones, even to the vanishing point. And thus the art of all these craftsmen is identical both in spirit and in execution with the art of the painter; the result, monochrome pictures in shades of gold or steel, in platina of varied lustres, in dyes or in silk embroidery, which are as effective, and which are endowed with the same charms as the painted picture in black and white. Thus it comes about that the lacquer boxes, the porcelain, the silk or cotton raiment, and all the thousand things which add to the charm of life to the Japanese, are embellished with pictures, executed in precisely the same way, with the same firm lines and evenly-covered surfaces, with the same gradations of tone, the same dark shadows and fleecy clouds, as those which came from the studios of the Kano masters. I will ask you to look at my *Japanesque* plates once more. Mr. Lennox has very kindly turned them upside down; he evidently thought it made the boughs of the trees a little truer to nature, though the birds now fare rather badly. They are full of extraordinary angles, which, considered as a mere arrangement of lines, are bad enough, but looked at as an interpretation of nature are impossible. There is little of either Eastern or Western pictorial art about any of them; the one in which the spray comes on at three places might perhaps be taken as giving the idea of a plate hidden in a bush. The *Japanesque* designer delights to dwell on the fragmentariness of his design, insists on the existence of the remainder of the boughs; his designs are clumsily composed, and still more clumsily set upon the surface. These are among the chief characteristics of *Japanesque* which I will ask you to bear in mind. Now let me endeavour to explain to you how essentially this *Japanesque* work differs from the Japanese work upon which it is based. In point of mere execution it lacks two of its essential qualities, the smooth swelling surfaces which are produced by gradual pressure on the long pliant brush, and the strength and sweep of the lines. I will not dwell upon this point; but I think you will follow me at once when I say that the free lines which are drawn by a man kneeling, as the Japanese do, over his paper laid upon the floor, must be essentially different from the free lines drawn by a man facing his canvas, and working with a mahlstick, or sitting on a chair with his material on a table in front of him. The part of the body which forms the axis of the free lines is in each case different. The line drawn, for example, with the axis at the wrist must have a different character from that drawn with the axis at the shoulder. The methods of drawing in the East and the West have each produced characteristic results. I do not wish to compare them, only the quality of Japanese work is so intimately connected with the method of its execution, that it is impossible quite to catch the spirit of it unless we adopt the method, *pro hac vice* of course. But the drawing of most *Japanesque* work is execrable from a Western point of view. Western art does not sanction smudges as substitutes for rose-leaves; Western art requires some observance of proportion between the different objects of a picture; therefore in the most elementary essentials, *Japanesque* sins against both the East and West. That it cannot catch the trick of the Eastern line is, as I have said, not exactly the fault of the draughtsmen. They do not profess to copy Japanese models, but rather to adapt Japanese principles to their own work. And the first point, on which I would not have dwelt so long did it not pervade the whole subject, is that they have missed the pictorial quality of this form of Japanese decoration, and have parodied it with crude outlines and haphazard smudging. It is the failure to recognise the pictorial quality of this Japanese work that has led to the *Japanesque* arrangement of branches which makes them appear as if they came from somewhere else, and the insistence on the existence of the rest of the branch, both of which are entirely foreign to the Japanese idea. Now, in the first place, it must be clearly understood that the Japanese do both profess and practise a rigid adherence to the structural principle of ornament. Their art never allows

them so to ornament a surface as to make it appear part of something which is non-existent. Perhaps the corresponding principle in pictorial art may be stated concisely, thus: a picture should not look as if it were a slice cut out of a panorama, with more to follow at either end. Japanese pictorial art, in its very nature, delighting to paint one incident, not many, enables the principles of focus to be more carefully observed than they are in the West. Now the bough of plum or cherry tree, with its buds and blossoms, is one of the most familiar subjects in Japanese paintings, for a very sufficient reason; it is one of the most familiar objects in a Japanese house. In the floral pictures with which, week by week, they beautify their homes, the Japanese use everything that nature gives them, not the bud and flower alone, nor the twig and leaf alone, but the whole bough. Whole branches of flowering shrubs are set in their vases, and these branches reappear in their pictures. And I think the simple secret of their being set close to the edge of the paper or the plate, is that that is precisely how the branch is seen in the house, cut in a sharp line by the edge of the vase or hanging basket in which it is placed. Then, too, a sort of artificial focus is obtained by the pruning of twigs and flowers at the base of the branch. But of suggestion of the rest of the tree, the suggestion of which Japanese is so full, there is not the slightest trace. Such an idea as that a spray should come on to the plate in three different places would be quite impossible for a Japanese artist even to imagine. Far more important even than the points I have already touched upon is the composition of the design for picture or ornament. And it is in this, as I think you will have seen, that Japanese, with its astonishing angles, true neither to nature nor to art, so terribly misses the mark. It is in this that the Japanese so entirely excel. I cannot but digress to dwell for a short space upon the Japanese art of beautiful arrangement, out of which composition in design springs. You are all probably familiar with one of the commonest forms of Japanese ornament—that in which the surface is sprinkled with heraldic devices, or with fragments or patches of ornament; often, in the case of a continuous design, it is broken in upon here and there by imaginary, or slightly indicated, cloud-masses. The principle is the same in both cases. The devices or patches may be few, or many, but they are set upon the surface irregularly, with apparent haphazard, or, as the Japanese say, "jiggi-jiggi." The effect is invariably charming; in spite of the very small material used to produce it, there is a sense of completeness which is the more surprising as it seems to conflict with every principle known to our own symmetrical art. And yet there is nothing haphazard about it: it is the result of a most finished study, guided by a most refined taste—the taste which enters into the minutiae of everyday life in Japan; whether it be the coolie setting out minute maple trees on the slopes of a miniature Fujiyama, the maiden settling gewgaws in her raven tresses, your "boy" arranging flowers for your table, the journeyman painter daubing colour on the commonest fan, all alike know the mysterious secret, and act upon it. You cannot live a week in Japan without noticing that it is deeply rooted in the people's instincts. I verily believe that, with some inclinations of the head, and not a few soft interjunctory reflections, a Japanese could put a postage-stamp on an envelope artistically. I pray you to forgive the banality of this word "artistically," but I use it deliberately. When the Japanese are said to be "so artistic," the speaker usually refers to this skill of theirs in beautiful arrangement. And those æsthetic souls who pose as the high priests of something they call "high art," they, too, have their little fantasies of arrangement; they love to set things all askew, thinking thereby to redeem themselves from the curse of commonplace, which indeed they do; they are certainly dimly conscious of one fact—that it is possible not to be commonplace. Beyond this they do not go, deeming "all anyhow" to be the perfect rule of art. "Culture," with its inept *niaiseries*, its tawdry and *fade* conceits, struggles still in the primers of a science of which the Japanese have long ago formulated every rule, and daily practise the examples. If they put one little flower-vase on a table, or paste on a screen a dozen differently-shaped poetry papers, the result is always effective, always charming; in their subtle arrangements there is a most admired disorder,

they seem indeed "to snatch a grace beyond the reach of art." Though I travel somewhat "beyond the reach of art," let me indicate, in the lightest and most Japanese method of suggestion, how wrapped up are the subtleties of this charm with intellectual pleasure. The delight which we derive from following a graceful curve, or from contemplating a perfectly balanced arrangement, seems to grow as the proportion between the "x" and "y" of the curve's equation, or between the "x" and "1-x" of the rectilinear arrangement increases in subtlety. There appear to be three distinct degrees of this pleasure. The pleasure of knowledge first, as of the proportions of a circle, or of a vase in the centre of a table; but this is of a very low order, often, indeed, approaching contempt. The mind knows at once how that is done. Then there is the repose and satisfaction of not knowing and not wanting to know. But when this satisfaction gives place to curiosity and the desire to know, the trouble of finding out produces cerebral fidgets; there is the excitement of discovery, probably the annoyance that the discovery was not worth the trouble after all, and the general subversion of that repose which beauty engenders. Some such intellectual processes seem to be the origin of the effects we call commonplace, beautiful, eccentric. And so, coming back to my vase and my table, the Japanese know not the one, but the hundred and one, places where to set the vase, so that the conditions are satisfied of subtle proportion and avoidance of curious or eccentric effect. And here, let me add, is an example of the abundant latitude which is left to individual expression in spite of the cloud of rules in which tradition and convention have wrapped this and every other Japanese subject. Precisely the same principle pervades the composition of all Japanese pictures, though one form of it very often leads to large spaces of blank, or, as it is often called, wasted paper. If the paper were cut down it would be so much nicer, so much more suited to form one of the crowd of pictures which jostle one another on our walls. Well, but the Japanese consider, in setting out the scheme of the picture, its relation to the area it has to cover; the balance of lines or of masses may, for instance, possibly require one shaft of bamboo to be carried up isolated into an otherwise blank space. The blank or slightly tinted paper seems to me as sufficient for all the requirements of art, as the wilderness of black, red, or blue paint with which we cover similar spaces on our canvases, calling them "backgrounds" of wall, curtain, or sky. The ugly necessities of primed canvas compel us to cover it all over with pigment; the necessities of the rapidly absorbent paper, or prepared silk, which the Japanese use, precludes their doing so; thus each necessity has produced its own law. But it is not in the somewhat lavish use of blank spaces alone, but in every line of the drawing, that this art of balanced arrangement is discernible, making for wholeness and completeness and repose. It is the absence of this that makes Japanese work so sprawly, distorted, and abortive. And verily it is not to be wondered at; it is not on our bizarre porcelain alone that this same quality of composition is lacking, but (I speak this with very bated breath) all our art seems to lack it altogether. Time permits me to dwell only on one other feature of Japanese work which greatly grieves the souls of the elect. Of recent years panels of doors have been decorated with boughs of trees which begin in space, sprawl across one panel, are continued in imagination behind the joint, to reappear and wander on across the second panel. It violates our own canons of art, but it is supposed to derive authority from the Japanese; yet, like every other Japanese notion, it is entirely contrary to their idea. If a Japanese artist has to ornament two panels of a screen with a continuous picture, he lays them close together on the floor, and, treating them as one, proceeds to paint his picture. Afterwards the panels are separated and put into the frame of the screen. There is thus no notion of the design being continued behind the frame. You will find the same principle in any Japanese picture-book. The double-page illustrations are deliberately cut down the middle and printed on opposite pages. Double-page illustrations are a vexation of the spirit. We have four ways of dealing with them, stitching-in, folding-down, printing sideways, and mounting on a guard. I do not say that in this case the Japanese

way is the best, but at least it is not more ruthless than stitching-in or folding-down, and is certainly more convenient than printing sideways. I have, with your kind indulgence, abused Japanesque sufficiently for one evening. I will endeavour to sum up its misdeeds in a single sentence. It conceived the Japanese art of ornament to be merely the embodiment of eccentricity, and therefore to be judged by other standards than those with which we had long been familiar: it cultivated eccentricity in its turn, and substituted for simplicity of style and vigour of execution crude designs and coarseness of workmanship. I have talked more of Japanesque than of Japanese; but I must now carry out my threat of saying a few words of Japanese art, and of showing you a few more specimens of it chiefly drawn from the Shiba and Nikko temples. With the form of Japanese decorative art which I have chiefly discussed this evening, the floral spray-work, most people are, I think, familiar. But I do not think it is so generally known that the art of the country, eclectic as is everything in Japan, embraces as many different forms of expression as there are styles in current use in the West. It is an eclectic art, but nothing ever passed into the service of the Japanese but it received the impress of the national spirit. A graceful symbolism and an ultimate reference to nature pervade it in all its forms, whether in the more fanciful side which makes it the most delightful of home arts, or in the severely classical side which puts it in the front rank of arts suited to devotion. For the panels and doorways for the shrine to a departed hero the Buddhist emblems furnish a hundred different diapers, so that the walls and doors glitter and scatter the light in a thousand fanciful ways. For the friezes and the ceilings not a flower that blows, nor the leaf that withers, but is pressed into the service; the peony and the chrysanthemum bend their stalks into a classic scroll, or the plum blossoms floating down the stream suggest new lines of exquisite tracery. Here a few lines of conventional work, notwithstanding their recurrence at regular intervals, and their almost geometrical treatment, compose a design as restless in its beauty as the sea-waves which have suggested it; and there the oft-repeated scrollwork tells of the summer cloud from which it has borrowed its shape. Dull monotony is packed away along with moulds and stencil-plates, and in its place, imaginativeness, suggestion, devotional reminders, worship of nature, infinite variety everywhere. That the art-instinct in the East, and among Eastern nations in Japan the highest, is higher than in the West, none will deny. It is not indeed to be wondered at. In that beautiful country life passes under easier and more graceful conditions than with us; there the days are not marred by the ever-presence and worship of the machine which civilisation the king has set up; there the sway of fashion is unknown, only that changeless law, the joy perpetual in the things of beauty; there one learns how great a part in life art may play, rendering every incident of the day more interesting by beautifying its surroundings, making them, when they minister to the wants of the body, minister also to the lust of the eye. It is in great part the lack of this, when one comes back to be ground by the great machine, that causes that Japanostalgia, which all suffer who have once set foot in that land of flowers.

STABILITY OF WALLS ON SOILS.—II.

Massive Buildings alongside of Light Buildings.

WHEN a massive building is erected close up to an existing light building, if a straight slip joint is not made in the case of using a party-wall, the heavy building is sure to drag down and wreck the contiguous parts of the light building. Very ruinous cases of this kind have occurred. It is very needful that the unit loading of the contiguous foundation should be as little as possible, consistent with the nature of the foundation soil, to insure the least settlement of the new heavy building.

But the case is greatly aggravated when there is no party wall used by both buildings together. Each building has its own independent footings on one side only of the adjoining walls, as in Fig. 5. This is one of the most difficult structural problems that the architect has to deal with when he cannot get abutting support on the adjoining property, because he has the weight of

the heavy division boundary wall to support upon the leg of an L, constituting a static couple, as shown by the relative position of the opposite arrows to the left side of Fig. 5, whereby tilting of the footings, and, to more or less extent, of the wall, is difficult to prevent. The difference of the subsidences of the light and heavy buildings is indicated by the scaled arrows, and evidence of the wreckage of the light building on the left, from the dragging down by the heavy building, is apparent from the nature of the case.

When additions are made on top of an old party-wall to serve for new higher buildings, the foundations, if not originally designed for the addition, should be widened by underpinning at suitable intervals, or otherwise, so as to produce a uniform rate of loading of the foundations for all parts of the new building, which rate should not exceed that of the old foundations.

Towers, Tall Chimneys, &c.—When towers, tall chimneys, &c., are built close to light walls or buildings, or when light interior walls are connected with heavy exterior walls, if the footing bases of each are not nicely adjusted to produce the same unit-area pressure upon the soil, unequal settlements must take place in compressible soils. It is therefore always safer to build them independently in the first instance, and to connect them afterwards when all settlement has ceased.

Extreme Cases of Undue and Unequal Overloading of Soil.—Only two such cases will be mentioned:—1. St. Martin's church, Trafalgar-square, the tower and spire of which overloaded the foundations, and subsided so disastrously as to drag down the facade, the centre of which it surmounts. The facade is all fissured and wrecked, and the tower also in a less degree. The lintels of the doors are more than 1 in. per foot out of level. Whether hoop-iron bond was inserted in the walls is not known to the writer, but such a provision would hardly have prevented the disaster that has happened. It is now contemplated to repair the wreckage, according to the specification and under the supervision of Sir Arthur W. Blomfield, A.R.A. 2. The next prominent case is that of the Great Yarmouth Town-hall (illustrated in the BUILDING NEWS, Sep. 27, 1878), the designs for which were chosen in public competition. The foundations were designed on the continuous principle of having footings underneath voids and solids alike. Very strong hoop-iron bond was lavishly employed throughout the external and internal walls; several tiers of hoop iron passing continuously through the masonry transoms between the horizontal tiers of voids. But notwithstanding such extra precautions, the entire building was wrecked externally and internally. The walls were fissured and out of plumb, and out of level from 8 in. to over 1 ft. at different points; the roof and gutters were also much wrecked and distorted. The wreckage was so wholesale that at first it was thought it would be necessary to pull it down and rebuild it. But in the meantime a plan of underpinning and restoration was submitted, and was successfully carried out, which was described in the BUILDING NEWS of Feb. 3, 1888, p. 174.

Lessons of Method of Restoration.—The study of the nature of the causes of such failures, and of the nature of the details of the method of restoration which have proved successful, afford the best form of practical lesson to the student of building construction. These details in regard to Great Yarmouth Town-hall, have been described at p. 174, BUILDING NEWS, Feb. 3, 1888. Too much importance cannot be attached to the fact in this, as in many other cases of failure of foundations, of the absence of due consideration of the practical bearing capacity of the underlying soil, and of the "law of subsidence," defined further on, and especially of the want of appreciation of the stratigraphical conditions of the site. In the present case there was no solid ground above the original sand and gravel beach of the pre-glacial estuary which lay submerged at a considerable depth (nearly 30 ft. at some points). The overlying soil being mainly accumulations of silt or ooze which had no solidity, being merely fine, soft, calcareous mud, derived from chalk formations, &c.

Rubble Footing Courses—Precautions.—In ordinary rubble-footing courses there is not sufficient attention given to the effectual bonding and overlapping of the preceding courses by those which follow as they are laid, nor to the disproportionate resistance of the truncations and the apex portions of triangular pieces, as they may be divided by the face of the footing course,

or of the wall, laid immediately upon it. Many defects arising under this heading may be attributable to the unshapeliness of the stones used for the purpose, many of which are left by the mason more or less triangular as quarried, for, besides being somewhat triangular, more or less elongated, or truncated, and irregular in form, they have their "beds" more or less "tailed off" as in Fig. 6, at *bcd* in the section of a footing. This "tailing off" may be either in the upper or lower "bed," or more or less on both these "beds." The vacuities in the walling thus occasioned are filled up with spawls, and chips, and with mortar. Now, referring to the plan of these footing courses, Fig. 7, *aa* are triangular blocks, such as the writer has seen laid, for masons are more particular to have the faces close-jointed than the backs of the course; *a'* is a back-filling or packing. The vacuities between are more or less solidly filled up with spawls, mortar, and debris of the work. The second or covering course is represented in dotted or fretted outline, *bbb*. The dotted line *cc* indicates the edge of the face of the next covering course *C*, Fig. 6, and similarly the dotted line *ww*, Fig. 7, indicates the position of the face of the wall, *W*, Fig. 6.

It will be observed that the area of the surface

of the bed-joint which projects outside of the edge of the covering course *bb* is much greater than the portion which is covered. The result is, that as the centre of gravity of a triangle which is its centre of reaction, is at one-third of its length as indicated at *r* in Fig. 8, and the centre of pressure of the covering course is at *P*, that a static couple is created, as indicated by the dotted opposite arrows, which tends to tilt the stone into the dotted position, whereby settlement and disturbance of the building is occasioned, from this source alone, independently of the disturbance which may result from yielding of the filling of mortar and spawls, underneath the tailings of the course stones of the footing. In all masonry the overlap of the covering course should exceed the half of the area of the lower course, to avoid any tendency to tilting up of its free end. When such tilting of the lower course of footings takes place its transverse section becomes curved, and upturned at the free edges so built.

Dangers of Inverted Arches in Foundations.—When building pilastered fenestrated buildings, or pier-panelled walls, upon compressible soils, it is often sought to give them more extended and equalised support by means of inverted arches laid immediately upon the footing, so as to prevent the piers from imposing undue unit pressure upon the underlying soil, by thus extending their bearing surface underneath the voids, which would otherwise have little direct pressure, in consequence of the yielding of the transom of masonry under the void. The

danger to be apprehended in such cases arises from the abutting outward thrust produced by the outside arch tending to become flattened, and (as in Fig. 9) to push outward and tilt the abutment or corner of wall at the springing of the arch, and thereby disturb the outer end or corner, as the case may be, of the foundation as shown dotted, which, however, indicates only the tilting tendencies, but not that of the pushing-out thrust, which is omitted to avoid confusion. But when the case is examined statically, according to the disposition of the points of the resultants of maximum pressure and reaction, there is an absence in the usual arrangement of such inverted-arch systems of a needful counterbalance of abutting stability between the points of maximum pressure and that arising at the central resultant of the reaction of the soil underneath the outer arch and the abutment foundation, tending to create a static couple at that point, and hence the tilting tendency. The flattening or spreading tendency of the outer arch could be avoided by introducing a tie-rod or band anchored to the inner piers, along the spring-line. The tilting out of the abutment, and also the canting of the footings could be made amenable to compensative static balance by a proper extension of the footings. It is usually recommended that inverted arches should not be flatter than the one-eighth part of a circle—i.e., equal to a rise of about one at the centre of the arch to five measured along its span-line or chord.

Soils are more or less Compressible.—All usual soils in building sites (except hard, solid rock), and including even compacted gravel and coarse, sharp, dry sand in natural deposits, and which are prevented from lateral flow by sheet piling revetments, &c., are in some degree compressible, and accordingly admit of corresponding subsidences with equivalent displacements of the imposed masonry. When structures are partly founded upon rock and partly upon gravel or other soils of dissimilar bearing power, more or less unequal subsidence occurs. Therefore, in the process of designing the foundation plan on the level of the footing base, an essential aim must be to keep the subsidence uniform throughout the extent of the building, and avoid unequal displacement of contiguous parts. When a soil is unequally loaded per unit area of its bearing surface on the foundation soil, there is an inequality of subsidence corresponding to the difference in the rate of unequal loading per unit area, according to the law of subsidence enunciated further on. The manner of unequal loading may be perpetrated in various forms and ways which are frequently lost sight of. These will appear as we proceed. The more compressible the soil the greater is the inequality of settlement. It is, therefore, advisable in dealing with the more compressible soils, such as clays, shales, loams, marls, silts, &c., to keep the rate of loading as low as possible consistent with economy and the objects and character of the building to insure the least permissible settlement taking place. It is an error to characterise, as is frequently done, gravel and sand as being equally incompressible with solid rock. Buildings and masonry structures which have been partly founded upon rock and partly on gravel have become fissured from the subsidence of the gravel.

The characteristics and conditions of stability or of mobility of foundation soils are so diversified and uncertain in the majority of their local forms that it is advisable the student of building construction should be aware that absolutely reliable practical application of much of the data which is available on the subject is only to be attained by intelligent appreciation of the subtle differences of composition to be met with even in different parts of the same building site. For instance, in the case of "clay," or the varieties of soil which ordinarily go by that name, their safe bearing power varies from $\frac{1}{2}$ ton up to 4 tons, and sometimes even to 6 tons, per square foot on a level plane, with a factor of safety ranging from 2 to 4. But when the tiro attempts to apply this data to any particular soil in question he finds himself at a loss if he cannot recognise the subtle qualities that it possesses, and which influence its bearing power as well as its permanent stability. True, he may drive, or have driven for him, a pick or crowbar, &c., into the "clay," which may perhaps resist such effort apparently as much as hard rock, and even give signs of not only hardness but likewise of toughness.

Dangers of Soil Transitions.—This same rock,

however, may upon a short exposure to the air or to damp be so much affected by absorption of their active principles as to be greatly softened and its stability so weakened that less pressure than one ton per square foot would cause sufficient displacement of a building to do a large amount of damage to the property. Some conditions of chalk make it also precarious as a foundation soil. Many such beds of shales and shaley clays are to be met with in the lias formation. The solvent properties of water and moisture on many soils, including the London clay, is very remarkable, no less than that of air, and the possible avenues of access of these to soils under foundations requires large experience to detect and to deal with effectually. The "pot-grown" of miners, which is the feldspar and potash of decomposed granite, and also pyrites affect the permanence of stability of soils in which they may be mixed when exposed to the air, so that they expand greatly in bulk, even when apparently quite dry, and therefore lose density. Moisture and water and air not only soften clays, shales, and clayey soils, but put them in a condition to be readily acted on by frost which follows the moisture deep into the mass, and causes expansion and softening, and consequent disturbance of foundations. Warm weather dries out soils so that they become fissured, which in turn form avenues for the permeation of moisture with its softening influence. The interior heat of a house, or of a workshop, factory, &c., may cause drying of a foundation soil if not protected by a layer of concrete, asphalt, &c.

The expansion of clays and shales, whether effected by air or moisture, appears to be of about equal extent, and is all powerful, as it will cause the displacement of the most ponderous buildings, and crushes the heaviest timbers put in excavations for shoring and strutting the banks.

(To be continued.)

BUILDERS' BENEVOLENT INSTITUTION. ANNUAL MEETING.

THE forty-fifth annual meeting of this Institution took place on Thursday, July 21, at the offices, No. 35, Southampton-row, Bloomsbury-square, W.C. Mr. B. E. Nightingale (president) occupied the chair, and amongst those present were Messrs. Thomas Stirling, E. Ryder, C. Ansell, and other friends of the charity.

Major Britton (secretary) read the report, which stated that an advance in some degree in the income of the Institution would be likely to justify the committee in advising that no eligible candidate need of necessity be excluded even for a time from participating in the anxiously sought for comforts which the charity bestows upon its recipients. It was satisfactory to observe that, amongst 55 pensioners, only two deaths had occurred during the past year, while three others had been elected. In accordance with the will of the late Mr. R. A. Newbon, of Islington, the Institution was entitled to a legacy of £1,000, less duty. This had to be invested in the stock belonging to the Institution in the Bank of England, agreeably to Rule 12, which applied to legacies. The sincere thanks of the committee were rendered to the president, Mr. B. E. Nightingale, for his energetic and effective appeal for the necessary means to meet the expenditure of the year, for his own liberality, and for the earnest and attentive interest taken by him in the prosperity of the Institution. The committee had pleasure in announcing that Mr. Joseph Randall (of the firm of Kirk and Randall) had accepted the presidency for the year, and would preside at the annual dinner in the hall of the Worshipful Company of Carpenters, when it was hoped to be a large and successful gathering.

Mr. Thomas Stirling moved the adoption of the report, which was seconded by Mr. E. Ryder, and unanimously agreed to.

Cordial votes of thanks were passed to the president, vice-presidents, trustees, treasurer, committee, and auditors.

The chairman then proposed that Mr. Joseph Randall be the president for the ensuing year. Mr. Stirling seconded the motion, which was cordially received.

A vote of thanks was passed to the chairman for presiding, and a similar compliment was paid to Major Britton in recognition of his exertions on behalf of the charity. The proceedings then terminated.

PRICES.*—XLI.

AN ARCHITECTURAL TOUR IN 1634.

(Concluded from page 68.)

WE left our three travellers at Chester. It was near the end of August when they arrived there, having passed in little more than a fortnight through Lincoln, York, Durham, Newcastle, and Carlisle, on their way from Norwich. Though two centuries and a half have rolled on since their diary was written, the notable buildings they saw are those which the tourist still chiefly wishes to see. They saw them to more advantage than we can. The Late Gothic work of the cathedrals was comparatively new. The last of it had been built within two or three generations, and was no more of an antiquity to them than Somerset House, for instance, is to us. Time could have marked it but little. Religious destructiveness had only done part of its work, for the Puritan surveys of Cromwell's time were yet to come. Churchwardenism, with its whitewashings and beautifyings, was in the distant future, and radical restoration was still undreamt of. It is interesting, therefore, to note the impression which our great national monuments made on men who saw them under such favourable conditions. But it is somewhat humiliating to think how few fine buildings of the first rank England has gained since the time of Charles I. And it is remarkable that those which have been added are rarely in the old towns and cities. Most frequently they are in modern places like Manchester and Birmingham—towns whose first small beginnings may have been ancient, but whose development was slow, and whose importance is a thing of recent times.

Chester Cathedral, even in 1634, proved to be disappointing. It is dismissed as being an old building of white stone, with no ancient tombs of any interest or value. The interest of Chester, then as now, lay elsewhere. The "rows," where "you may walk dry in any wet weather on a gallery by all the shops," were, as they still are, the most characteristic feature of the place. The houses struck our tourists as indifferent. Half-timbered work, no doubt, was familiar to them, and familiarity had produced contempt. Moreover, the half-timbered buildings at Chester are not, taking them altogether, of the very best type. They are far less satisfactory than those at Shrewsbury, and, if the truth may be told, one does grow rather weary of their multiplicity. A wooden house here and there is very well; but whole streets of wooden houses are too much for most of us. St. Mary's, Chester, proved more satisfactory than the cathedral. There, in "Tropie's Chappell," was a curious monument of alabaster, to Lord Tropie and his lady, a princess; and another to his son, whose wife was daughter to the Earl of Shrewsbury. On Christmas Eve, the mayor, sheriffs, aldermen, and common councillors had a custom of going about the city in triumph, with torches and fireworks. The recorder then made a speech on the antiquity of the place, and told how it was founded by giants. On Midsummer Eve the giants and some wild beasts kept for the purpose were taken round in another procession. The days of Queen Elizabeth and her two next successors must have been the golden age of giants. We read of them everywhere, and no pageant seems to have been thought complete without them.

At Stafford, mention is made of a fair Shire Hall, all built with freestone, very high and stately. On each side of it were six open arches, with great pillars. It was all paved with stone, and was the chief fabric and pride of the town—"if it were but handsomely and cleanly kept." The large church was not at all adorned. After crossing the Trent at Onseley, the travellers came in view of a most stately, gorgeous house, built castle-like (Lord Paget's). Its gardens and walks, made to grace that sumptuous building, cost a great sum of money. Next appeared "those stately high spires of Lichfield Cathedral, standing as the city doth in a sweet and pleasant site, where the rich meads and fertile fields environ her on every side." The Medieval love of plains, and horror at mountains and rocks, had not quite died out yet. Many fair and ancient monuments remained in the cathedral, including Bishop Langton's, Bishop Hayes', and Bishop Butler's; also Lord Basset's, of Drayton Basset, in his coat of mail and armour of proof, with the wild boar at his head and feet; Lord Paget's, with his son and his lady, "with the tiger at the top, and eight fair marble pillars." In the Lady

chapel there were eight stately painted windows; and on the west front, above 100 fair statues of Kings, Patriarchs, Prophets, Fathers, and Apostles. In time past, it was reported, these had all been gilt. The interior of the choir had still six gilt statues, three on each side. These probably, like Marmion's supposed tomb there,

"Were levelled when fanatic Brook
The fair cathedral stormed and took":

and though much has since been done in the way of repair and re-adornment, we can never look upon many of the works which our captain, lieutenant, and ensign viewed with such enthusiastic admiration. They lived near the end of the art-producing ages, and we, it is to be hoped, near the end of the art-destroying ones.

In the Close at Lichfield there was a spacious hall, raised some dozen steps above the ground. Its roof was of "Irish timber," richly and curiously carved. A great part of the carving was gilded, and the roof was covered with lead. At Burton, the travellers found a great cathedral-like church, but naked, bare, and plain. Their tastes were evidently not for that baldness which in later times people used to call simplicity. All Hallowes, Derby, pleased them better. Its beautiful tower, 70 yards high, was built, they tell us, in King Henry the VIII.'s days at the cost and charges of some young men and maidens. An inscription to that effect was engraved on the outside of the steeple. Inside the church were the tombs of Parson Johnson, Mr. Crashaw (a London merchant), and Lady Shrewsbury. This last tomb was of marble, alabaster, and touchstone from her ladyship's own grounds in that district. At Nottingham was found a town which was nothing but rock whichever way they walked. Most of the cellars, as many of them still are, had been hewn out of the sandstone, and many dwellings also. Of these last few now remain, for the material wastes away rapidly when exposed to weather and hard usage. At Leicester the ruins of the Temple of Janus were exhibited near St. Nicholas Church. Coventry interested our tourists much. Here they rested very quietly and contentedly, and in the morning addressed themselves to a stately, fair church, which for largeness, lightness, and neatness might compare with many cathedrals. This, of course, was St. Michael's. Its tower was built, they state, by two maids at a small charge. Bray, who saw it in 1777, says that St. Michael's steeple was begun in 1373, and finished in 1395, by William and Adam Botoner, who expended £100 a year on it. At this rate the tower and its lantern cost £2,200. The spire was added by two sisters, Anne and Mary Botoner, in 1434. The total height is given as 300ft., which agrees very closely with that shown on Mr. J. O. Scott's beautiful drawing, which we published some years ago. The two sisters' "fair gravestone in brass" was still to be seen in 1634, though somewhat defaced. Coventry then had a strong wall, three miles in circuit, twelve gates, and many towers on the wall; but its three spires, as now, made up, as far as steeples were concerned, the whole city. Kenilworth Castle was not yet in ruins. Its great hall had a handsome roof of "Irish wood." There were rich chimney-pieces of alabaster, black marble, and curiously-carved joiner's work; luxurious rooms in the spacious tower repaired at great cost by that "favourite of late days, Robert Dudley, Earl of Leicester," and, above all, there was the plain, private chamber which "our renowned Queen of ever-famous memory" always selected for her own.

Warwick was the next attraction. Near it, and by the high road, was a leaning cross. The castle is described as "most sweetly, and very pleasantly, seated on a rock, very high, upon that river, the Avon, which divides the shire in twain." The grounds were adorned with all kinds of delightful shady walks and arbours, groves, and wildernesses; with fruitful trees, delicious bowers, odoriferous herbs, and fragrant flowers. There were many curious fishponds, hewn out of the solid rock, like cisterns, and well-stocked with fish. The Beauchamp Chapel was found to transcend report. Its glass windows were richly and curiously painted, and its monuments to Richard Beauchamp, Earl of Warwick; Robert Dudley, Earl of Leicester; Ambrose Dudley, and Thomas Dudley, Earl of Warwick, are commemorated in a long description. In Stratford-on-Avon church was a monument to the Earl of Totnes, one to Sir Hugh Clopton, "a neat monument of that famous English poet,

Mr. Wm. Shakespeare, who was born here"; and "one of an old gentleman, a bachelor, Mr. Coombe, upon whose name the said poet did merrily farm up some witty and facetious verses." These verses, it appears, could not be copied for want of time. What golden opportunities of acquiring information about Shakespeare, so soon after his death, the writers of this diary must have missed! How grateful the literary world would have been for the least addition to its knowledge about him; and how near these three officers of the Military Company at Norwich came to securing a sort of adventitious immortality!

From Stratford they went on to Worcester, and thence to Hereford. There they stayed at an alderman's house—"a host of both quality and reckoning. For the former his breeding showed it, and for the latter our purses have cause to remember it." The city had a strong wall, nearly two miles round, with six gates and many watch-towers. There were six churches, "with their old mother church," which, in her outward habit, appeared very like her sister of Carlisle. Still, the cathedral had some brave monuments, including those of eight Norman bishops and many later ones. The chapter-house was little inferior to any, and contained some good antique windows in fair colours. On its walls there were 46 old pictures, curiously drawn and set out. These included Christ and the Twelve Apostles, Edward the Confessor, St. Chad, St. Winefride, and other holy women, as also certain benefactors to the church. In the midst of the chapter-house was a pulpit, from which every canon, at his first entrance, had to preach four Latin sermons. The Hall of the Vicars-choral, where they dined together, was adorned with richly-painted windows. They had a library of their own, and a good supply of cordial liquor. Our travellers were loth to leave them; but after breakfast they took horse and posted to Gloucester. They entered it over a very fine arched bridge, and found in the middle of the city a handsome cross, at which the four principal streets met. There were twelve churches, of which the cathedral, then called the College Church, was one. In this they were greatly entertained with a "strange and unparalleled whispering-place of 24 yards circular passage, about the high altar, next to the Lady chapel." On the north side of the high altar was the tomb of a Saxon king, bearing the old church upon his breast. Elsewhere there remained the monument of Robert, Duke of Normandy and eldest son of William the Conqueror. His portraiture was "of Irish wood, painted, which neither rots nor worm-eats." What kind of wood was this? Not Irish bog-oak, because roofs are described in this diary as having been made of it. Was there the same sort of popular belief in the 17th century about Irish wood which there still is about chestnut? To this very day the constable in charge at Westminster Hall informs strangers that its roof is made of horse-chestnut wood, so that no spiders or other insects can live there!

Saturday, Sept. 12, found the travellers at the great city of Bristol, then second only to London. Here, again, there was a fair cross between the two bridges. It had been lately and richly beautified, and was hardly inferior to the celebrated one at Coventry. At this cross four streets met, namely, High-street, Broad-street, Wine-street, and Corn-street. Bristol had 18 churches, and it is particularly noted that their pulpits, on which the citizens have spared no cost, are most curious. Nor was the outlay wasted, if we may believe the assertion in the diary, that "they daily strive, in every parish, who shall exceed the other in their generous and religious bounty." The buildings of Bristol, and especially the churches, were most strong and sumptuous, except the cathedral, of which there was little in existence besides the choir. "Ratcliffe Chapel," as it is here called, with its "artificial imboved arched roof, all built of freestone," far surpassed it in beauty. The rich citizen who built it, and who had been five times mayor, finally took holy orders "to avoid marrying one of the King's concubines." He died Dean of Westbury, and built there a college for canons. The next place visited after St. Mary Redcliffe was St. Vincent's hot well. Then these officers "laid aside their commanding postures, and turned pioneers, to dig and delve for glittering bastard diamond stones, which that hill plentifully afforded." Passing the neighbouring lead mines, they came to Wells, "another cockpit city." Much admiration was bestowed on the

towers, and on the sculptures of the west front. The fine windows of the chapter-house, "neatly painted with the history of the Bible," the bishop's palace, the vicar's college, and the cathedral cloister are all described in glowing terms. They saw Glastonbury Abbey—then in ruins except its tower—at a little distance, and would have gone nearer if they had felt sure of seeing the grave either of King Arthur or of Joseph of Arimathea. They were even sceptical about the winter flowering of the Glastonbury thorn, though this is no miracle, but a botanical fact. Two old trees of this variety were still growing near the abbey early in the present century. They flowered in May, and again, less freely, in December, and were considered to be of the same species as the common hawthorn.

The tourists had reached their western limit. They turned and made for home, one passing through Bath, Malmesbury, Cirencester, Sherborne (Gloucestershire), and Burford to Oxford, and the others reaching the same town by way of Salisbury. There is a long and interesting description of the figure-subjects of the south porch at Malmesbury. There were about 25 of these on each of three arches, beginning with Light from Chaos, going on with the Creation, the Fall, the Death of Abel, the Building of the Ark, the Offering of Isaac, and the greater part of the Old and New Testament history. There is also a good account of Woodstock. From Oxford a pretty direct road was taken to Cambridge, and thence to Norwich. Our three companions got safely home on the 26th of September, "having marched 800 and odd miles, passed through 26 famous shires and counties, billeted handsomely in 15 fair and strong cities, doubled, and offered up devotions in 13 ancient, rich, and magnificent cathedrals, and closed in the rear with the two universities." They pass out of sight, and we meet them no more. In a few years the Civil War began. Did they fight for King or Parliament? Did they survive or fall? There is no knowing. "Their swords are rust, their bones are dust, their souls are with the saints, we trust."

THEATRES.—II.

By ERNEST A. E. WOODROW, A.R.I.B.A.

THE necessity of good sound construction in building theatres was commented upon by Saunders in his "Treatise upon Theatres," published over a century ago. In this work he says:—"The whole of the theatre should be surrounded by a thick wall, as well next the stage as on every other part. Over the opening of the stage an arch may be turned, on which the wall may be continued up through the roof, so as to prevent all communication of the timbers." Here a hundred years ago the proscenium wall, which has only been universally adopted in recent years, was advocated. To continue quoting Saunders:—"The passages communicating with the boxes should all be arched, and have an easy access to spacious stone staircases that would, in case of fire, enable the audience to depart without the least hazard; and though it be necessary to confine the entrances to a few in number, yet there ought to be many large doors, hung on the outside, ready to be thrown open at the conclusion of the performance, and upon any sudden alarm." In a footnote the writer says: "The dreadful consequence of doors hung on the inside cannot be too much attended to, thousands have fallen a prey to the flames, through that single circumstance, when an alarm takes place all are eager to gain the outside, and the crowd carry the door with them till it shuts; others pressing forward prevent it being opened, and thus they are confined to destruction."

I may be accused of referring to what is known by every architect when I draw attention to the above words of Saunders; but I ask why, if every architect knows the necessity of this simple means of increasing the safety of the public, do we find thousands of churches, chapels, lecture halls, and other places where the public assemble in large numbers with the doors opening inwards? Architects cannot plead ignorance.

To return to Saunders's description of structural detail. "Partition walls," he says, "should be carried quite through the roof in as many places of the building as opportunities afford; and no one would neglect to render it insulated where it is possible."

This last sentence brings me to the all-im-

portant and much-discussed question of what is a suitable site for a theatre? What is a safe site? Saunders practically says an isolated site when you can get it, and that, in fact, puts the whole question in a nutshell. It has been argued again and again that on the Continent, isolated sites are obtained, because state aid is available, and that managers can thereby afford to procure better sites. There are, however, other difficulties in addition to that of the prohibitive cost which have prevented English managers obtaining perfectly isolated sites; theatres to be made to pay must be situated in the densely populated or fashionable quarters of the town, and within a very limited centre. Here land is not only dear, but very difficult to obtain at any price, and it is only when such rare opportunities arise as local street improvements, that the enterprising manager has the remotest chance of finding a suitable and isolated site for his theatre; when he has that, fortunate is the architect who has the theatre to design, for his work should then be all plain sailing. One point must not be lost sight of: that it is on the Continent that the worst disastrous panics and losses of life have occurred. The cause of this, however, is not so much from structural defects, as from the fact that our Continental neighbours are of a more excitable temperament, and rush into a stampede sooner than the cooler-headed Britisher. Much, too, is due to the foresight of the British manager.

To meet the demands of the circumstances under which we are thus placed, we do not find the rules as to site enforced in England so stringent as those of the continent. The rule of the London County Council reads as follows, and I have endeavoured, by the aid of a diagram, to illustrate this regulation:

"One half, at least, of the total length of the boundaries of the site of any such premises which consist of an entire building, and in case of a room or other such premises not consisting of an entire building, one half, at least, of the total length of the boundaries of the site of the building of which such room or other such premises form part, shall abut upon public thoroughfares, of which one thoroughfare at least shall be not less than 40ft. wide, and of the remainder, none shall be less than 30ft. wide if a carriageway, or 20ft. wide if a footway.

"If, in compliance with Regulation No. 10, an additional passage or way should be necessary, it may be provided by means of a private passage or way.

"Such passage or way shall not be less than 10ft. in width, and under the complete control of the owner of such premises, and no doors, windows, or other openings of the adjoining premises shall communicate therewith, or overlook any portion of such passage or way."

Regulation No. 10 reads as follows:—

"Two separate exits, not leading into the same thoroughfare or way, shall be provided to every tier or floor of such premises.

"If any tier or floor shall be divided into two parts, two separate exits, not leading into the same thoroughfare or way, shall be provided to each of such parts.

"Such exits shall be arranged so as to afford a ready means of egress from both sides of each tier or floor, and shall lead directly into a thoroughfare or way."

As the circumstances and difficulties are somewhat similar in the City of New York as in London, it is interesting to compare the regulations there enforced with that already quoted.

"Every theatre, opera-house, or building hereafter erected for theatrical, operatic, or for any public amusement, or the remodelling of any building for the aforesaid purpose, shall have at least one front in the public highway or street, and in front there shall be suitable means of entrance and exit for the audience. In addition to the aforesaid entrances and exits on the public highway, there shall be reserved for service in case of emergency, in every such building, an open space equal to one-sixth of the width of the building, outside to outside measurement, and in no case less than 8ft. in width in the clear in its narrowest part, on the one side not bordering the street, where the building is located on a corner plot, and on both sides of said building, where there is but one frontage on the street."

Since the preparation of this diagram, the Laws relating to the Construction of Buildings in the City of New York have been this year

amended, and some interesting variation is made in the required width of the open space at the side of the theatre, the dimension being rightly governed by the seating capacity of the house.

The amendment allows that the width of the

Site plan in accordance with the rules of the L.C.C.

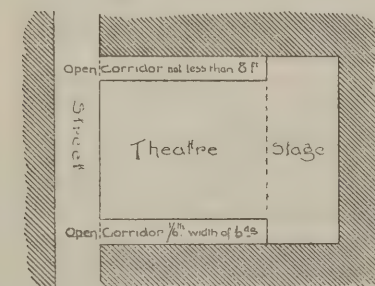

Site plan in accordance with the rule No. 10 of the L.C.C.

open court or courts shall be not less than 7ft., when the seating capacity is not over 1,000 people; above 1,000, and not more than 1,800 people, 8ft. in width; and above 1,800 people, 10ft. in width.

The open court or courts shall begin on a line with or near the proscenium wall, and shall extend the length of the auditorium proper, to

Site plan on a corner block in accordance with New York rules

Site plan in a thoroughfare in accordance with New York rules

or near the wall separating the same from the entrance lobby or vestibule.

"A separate and distinct corridor must be provided in a New York theatre to continue from the open spaces to the street through such superstructure as may be built on the street side of the auditorium. These corridors must in no

case be reduced in width more than required for the thickness of the outer wall forming one side of the corridor, nor are they to be more than 3ft. narrower than the open spaces. The openings to these corridors must have doors or gates opening outwards towards the street; the outer or street gates may not project beyond the street line when open. Recesses not exceeding 4in. in depth are to be left in the walls at the sides to receive the gates when open, so as not to diminish the width of exit. During the performance the doors or gates must be kept open by strong locks."

With regard to the compulsory open spaces at the sides of a New York theatre, they must at no time be used for storage purposes, or for any other purpose but the legitimate use of exits. This is purely a question of management. "The level of the corridors from the open spaces must not be more than one step above the side walk."

With regard to Continental regulations, we find in St. Petersburg, Brussels, and Italy perfect isolation is insisted upon, and in Brussels, where the surrounding open space is less than 10ft. 6in. wide, there must be no windows overlooking the theatre belonging to adjoining premises. This, of course, is to prevent fire or smoke from neighbouring houses entering the theatre and causing false alarm. The London County Council insist that no theatre shall be erected upon a site within 20ft. of any windows or other openings belonging to any other premises overlooking the site.

In Austria only the large theatre need be perfectly isolated; the smaller play-houses, holding less than six hundred spectators, may have the back wall of the stage abutting on other premises. In Paris, theatres may be built either attached or detached. In case of their being detached, there must be left on all sides, with the exception of those adjoining the public way, a clear space or passage way not less than 9ft. 10in. wide, providing the neighbouring houses have no openings upon the said passage. If such is not the case, the width must be increased in proportion to the size and general arrangement of the building. No doorway may be formed between the passageway and any portion of the adjoining premises in the case of a Paris theatre which is detached, nor any communication formed between any portion whatever of the theatre and the adjoining premises, in case the theatre is attached.

The vast importance of the judicious choice of site can be more clearly seen from the references I have made from various codes of regulations, than from any arguments of mine. Not only must the site be considered with regard to obtaining ready and ample means of exit, but also as to the nature and character of the surrounding premises, the risk that will be incurred, if any, from the contents of such premises, and from the nature of the trade carried on therein. One would not choose a site next to a timber yard, or abutting on a fire-work factory; it must always be remembered that it only requires the smell of a puff of smoke to cause one of the audience to cry fire, and the whole house to get up in a mad rush. The site question is, therefore, an all-important one, and I do not hesitate to say that one cannot build a good or safe theatre on a bad site. It is obvious, that many exits leading directly into the streets, must assist towards securing the safety of the public. The number of exits and their fitness depend entirely upon the appropriateness of the site: a site must be found to suit the plan, not a plan to suit the site.

The rules and regulations that are enforced in various towns and cities at home and abroad, have forbidden the building of a place of public entertainment upon a plot of land behind a row of houses facing the street. These backyard theatres, which, fortunately for public safety are things of the past, were entered by long narrow passages passing through other premises in other occupation in no way separated from them by fire-resisting walls and floors. In some cases these entrances were part of the ground floor of dwelling-houses, and if at any time fire had occurred in the living-rooms over, the entrance to the theatre would have been completely cut off as a means of escape.

When such condition of affairs as these existed, people satisfied themselves that "extra exits," "alarm exits," or "emergency exits" (falsely so-called) would be available when wanted. Now, from years of observation and study of this class of building, I may assert without hesitation that people always will go out the way they come in.

and the only exception to this rule is among the *habitués* of a theatre, who know their way about the theatre as well as they do about their own houses. I know of one theatre where from the stalls seats the street can be seen through the exit door, and yet the public prefer going upstairs to the dress-circle level and down again to the street, because they came in that way. I illustrate this instance to show how the public are most difficult to deal with, and will not take advantage even in calm moments of the extra exits provided.

Entrances and exits should be so planned as to correspond and balance the one with the other, and this calls for a symmetrical plan, a simple plan—a plan that can be taken in at a glance, the one side corresponding with the other—a pit exit on the north, and a pit exit on the south; a gallery staircase on the right, a gallery staircase on the left. To obtain this all depends on the site: either the site must be isolated or passageways must be given up by the owner, to leave open spaces on both sides of the auditorium, as required by the New York regulations. I shall have to dwell more fully upon the symmetrical arrangement of entrances and exits when dealing with the chapter upon this detail of theatre planning.

Before leaving the all-important question of site, I may, perhaps, be permitted to quote Sir Eyre M. Shaw upon this point. He says: "If a theatre be surrounded on several sides by other buildings, it should have no windows or other openings in the direction of those buildings, and care should be taken that it should be so constructed that it would be impossible for it to be affected by anything happening in them. The practice, for instance, of allowing the roof of a building to lean against a theatre wall with openings in it above the point of contact is one wholly inconsistent with the safety of the visitors of the theatre. No rule can be laid down as to the distance to be allowed in towns, as so much depends on the nature and contents of the adjoining buildings, and the purposes for which they are used; but in any special case it requires but a very small exercise of intelligence to ascertain instantly by personal observation whether fire could be communicated or not."

HEIGHT OF BUILDINGS IN CHICAGO.

The Common Council of Chicago have issued a rule affecting the height of buildings, which is, briefly, that no building shall be hereafter erected in the city of a height exceeding 150ft.; that if the street is not more than 80ft. wide, no building upon any street or plot abutting thereon is to exceed 125ft.; and that no building exceeding 100ft. in height shall be erected upon any street, or lot abutting any street, the width of which is not more than 40ft. Where, however, any building is erected with frontage upon two or more streets of different widths, the height of such building shall not exceed the average of the maximum heights which are permitted. For example, where a building is erected fronting two streets of 40ft. and 80ft. respectively, the height shall not exceed 112½ft. But if any building is set back in whole or in part from the street line in such manner as to increase the width of the street in front of the same, or in front of any part, not less than one-third of such building, then an increase in the height will be permitted directly in proportion to the aggregate increase in the width of the street so made; but no building exceeding 150ft. shall be so increased in height, nor shall the height of any building be so increased as to exceed 150ft. It is provided, moreover, that parts of buildings may be carried to greater heights back of and within a line drawn from a point in the opposite side of street at the established grade, through the highest point of wall of said building next to street; but no building exceeding 150ft. in height shall be so increased in height. Spires, towers, domes, or cupolas limited to an area of 15 per cent. of the ground area of building may exceed the above heights. These limitations certainly exceed those which sanitary and æsthetic conditions would suggest. For example, a structure 100ft. in height in a street of only 40ft. wide is excessive, as that height exceeds twice the width of street, and would seriously interfere with the light of lower rooms, at least in this country, but the difference of latitude has to be taken into consideration.

SAND, EARTH, AND GRASS ROOFING.

IT is very interesting to learn that there are roofs which need no gutters, and which are so flat that upon them gardens, terraces, bleaching and drying grounds, &c., can be placed. We herewith draw the attention of our readers to these roofs, which have already gained for themselves the highest approval of magistrates and other competent persons in Germany and adjacent countries for buildings of all kinds, but are not known yet, or very little, in England, where, however, they were patented a short time ago. There certainly seems room for them in this country, if only that they render possible a small garden, or at least a piece of lawn, on the tops of our houses, where now and then we can enjoy an undisturbed hour in something like fresh air. These roofs have been in use in Germany about fifty years, and have proved to be not only absolutely watertight, but also thoroughly fireproof, and give the highest protection against storms, heat, cold, dust, snow, hail, &c. They can be adapted to every building and to every climate. They are very cheap, and in manufactories about 40 per cent. of surface is gained, and very considerable expenses in wood and wages are saved, as the windows are very easy to be placed and light is gained. These roofs can be constructed with slopes towards the middle, so that the rainwater will be conducted through hollow pillars or tubes into basins placed in the middle of the building, where it can be employed for several purposes. These roofings are being introduced into our country by Mr. C. F. Beer, architect, of Cologne (Rhine), and Mr. Alan B. Crombie, of Dumfries (now his representative), was the first architect who made a trial of them in England, which has been proved most satisfactory. The above illustration shows the various roofing methods and their superficial contents in comparison with the wood-cement roof, and show that the latter possesses the least roof surface.

DIFFICULTIES ENCOUNTERED IN THE SEVERN TUNNEL CONSTRUCTION.

In constructing the Severn Tunnel the chief precautions had to be taken to resist the water pressure, which, of course, is equal all round, and according to the head of water at each point, and these converging pressures have to be resisted by the brickwork. Thus the vertical load is converted into a thrust, or bed pressure, all round, and these bed pressures are much greater than the water pressures outside, and vary in proportion to the radius of curvature of the arch. In a paper read by Mr. Charles Richardson, M.Inst.C.E., of Bristol, on "The Severn Tunnel," the author alludes to this question of pressure in a river tunnel, and observes: "The result, therefore, is that, while the water pressure on the crown of the arch is 52lb., the bed pressure in the arch is 3.15cwt. on the square inch; but the invert being of a flatter radius, while the water pressure is 64½lb., the bed pressure is 6.09cwt., or just about double what it is on the arch; so to make them of equal strength against water pressure the bed should be twice as thick as the arch."

Our readers will readily follow this reasoning, and will understand the necessity of making invert arches of segmented form much thicker than the crown arches of structures of this kind, subject, as they are, to converging pressures from without, and which are intensified in the beds between the *voussoirs*, especially those beds in which the "line of pressure" does not

coincide with, as in those of the invert, the flat curve of which may be regarded as a flat arch under a great load. Unless it is made thick, the line of pressure would be close to the intrados at springing, and would pass close to the extrados at crown. In the Severn Tunnel the 27in. invert would have been strong enough to bear the thrust if the load had been distributed, but it actually "gave way in some places in the wet part of tunnel, where it passed through a bed of hard conglomerate rock; for nearly twenty chains in the neighbourhood of the big spring was so full of water under great pressure, which made it spurt out in all directions, that the miners had considerable difficulty in keeping any light burning by which they could see to work." The bricklayers also experienced difficulty from the same cause, and considerable labour was entailed in putting in the invert in the wet places, for after the bottom had been made for the brickwork, the clear water welled up in large springs from the joints, and from every fissure in the rock all over the excavated floor. If the brick invert had been laid on such a bottom, the pressure of water upwards (60lb. to the inch) would have raised the brickwork up in a body, or forced its way through the joints, washing out the cement. To avoid this evil the water pressure was taken off by 3in. iron pipes against all the springs in the side and upper walls, and by a 12in. stoneware pipe cut through the rock under centre of invert, so as to drain off the leakage during the construction, and to allow the cement to set. The brickwork consisted of six 4½in. rings in the arch and invert, bonded work in the side walls. After corking up the pipes and stopping the invert drain six months after the brickwork had been finished, to give time for the cement to set, the pressure gradually came against the brickwork till the pressure of 60lb. per inch was reached. As soon as this pressure was felt, streams of water spurted through many joints of the work with much force, and sometimes a flake 2in. thick would fly off with a pistol sound. On the invert the water pressure was most remarkable. A patch of 20 or 30 square yards of the top ring of brickwork could be seen to rise slowly till it fell to pieces a heap of loose bricks. These were cleared away, and soon the second ring began to rise slowly and fall to pieces, and the third ring followed in the same manner. To prevent further destruction to the invert, the contractor uncorked the pipes and took the pressure off.

At a meeting of the Royal Hibernian Academy of Arts, held on the 18th inst., Mr. J. L. Robinson and Mr. Johnston Inglis, Associates, were elected constituent members of the Royal Hibernian Academy, which elections have since received the approval of his Excellency the Lord Lieutenant. We congratulate Mr. Robinson, who is well known to members of the London Architectural Association as the honorary photographer of the excursions and as a racy lecturer, on his well-deserved honour.

The Halifax borough engineer, Mr. Escott, has issued a report to that body on a proposed scheme for dealing with the borough sewage at Salterhebble. The scheme suggested is one by gravitation, although eventually it may be found necessary to pump the sludge upon higher ground—the water in the Hebble brook to be utilised to drive a turbine for working the pump. After two years of experiments, the conclusion arrived at is to construct settling tanks, precipitation tanks, and sludge filter beds, and to treat the sewage with chemicals. The estimated cost, exclusive of land, is £14,000, and the annual expenditure, again exclusive of land, £2,000. The cost of the land is £5,683.

SKETCHES IN SPAIN.

THESE water-colour sketches of Andalusian architecture were made by Mr. W. H. Seth-Smith during his tour in Spain last winter. It is no use to attempt out-of-door sketching elsewhere at that time of the year; but in Spain, unless the season is exceptional, lovely weather may be counted upon up to the end of December. The Court of Oranges, in front of the Mosque of Cordova, seen in the brilliant sunlight at that season, when the trees are laden with ripe oranges—with its grand bell tower, fountains, its great orange and olive trees and palms all inclosed in arcades and walls of crumbling grey and yellow stone, and rich brown tile roofs to the cloisters, and green sward—is a dream of beauty never to be forgotten. Cordova is certainly one of the most picturesque, as well as one of the most interesting, of southern Spanish cities both to the artist and to the architect. The Giralda Tower, in Seville, is drawn by everybody, and well repays the draughtsman for his trouble. There is no more successful example of adaptation of Renaissance architecture to an existing pagan building, and the details of the Moorish work in this tower are most refined, and worthy of close study. A Courtyard in Seville forms an entirely self-composed subject, and is to be found immediately to the north of the church of St. Salvador.

SELSDON PARK.

SELSDON in Sanderstede, in the 10th century was the property of Duke Elfred, a Saxon nobleman, and formed part of the manor of Sanderstead long before the Domesday Survey. After the dissolution of the monasteries by Henry VIII., Sanderstead, with Selsdon, passed into the hands of John Ownsted, Serjeant of Carriages to Queen Elizabeth. At a subsequent period the property belonged to the Bowyers, and afterwards became the property of Wm. Coles, who in 1809 sold it to Geo. Smith, M.P. The house was more lately tenanted by the Bishop of Rochester (Dr. Thorold), and is now the property of William Stevens. By this time the building had degenerated into a stucco baronial hall, but has now been entirely refaced with red brick and stone dressings, and the interior elaborately decorated and refitted, from the designs of Mr. W. F. Unsworth. The builders were Messrs. W. H. Lascelles and Co., London. The plumbing and drainage was done by Messrs. Norris and Sons, Sunningdale. The stone-built conservatory, from the designs of Wyatt and Brandon, remains untouched. The upper view herewith illustrated is now being exhibited at the Royal Academy.

TURRET STAIRCASE, STANMORE HALL.

STANMORE HALL is a fine mansion situate in the north of Middlesex, and commanding splendid views in the neighbourhood. It has recently been largely added to for Mr. W. R. D'Arcy, the present owner. The turret staircase leading to the rooms occupied by the family we illustrate to-day. On plan it is octagonal, with a square well-hole, the four newel-posts running right up from the ground to the second floor. Steps only occur upon four sides of the octagon, the other four forming triangular buildings. All the soffits of the stairs are panelled, and the whole is executed in wainscot, the walls being built of Beer stone. The windows are filled with quarry glazing of Venetian rippled glass and opalescent glass, which, when seen against the sky, shows a soft golden tint, but against the buildings a milky white. The glass was supplied by Messrs. Simpson and Son, of St. Martin's-lane. The whole of the rest of the work was executed by Messrs. George Grimwood and Sons, of Sudbury, except the carving, which was executed by Messrs. S. W. Elmes and Son, of South Kensington. The drawing is by the architect, Mr. Brightwen Binyon, A.R.I.B.A., of Ipswich.

OXFORD MUNICIPAL BUILDINGS.

We have now so fully illustrated all the five designs submitted in the final competition, that very little indeed remains to be said in respect to this sheet, which further represents the design sent in by Messrs. Perkin and Cheston. Their plans, elevation, and details figured among our plates on the 8th and 15th inst. The present drawings show the two leading sections giving particulars of the Town-hall and its approaches under the tower, which formed the main feature in the chief front of their buildings.

TWO HOUSES AT SUTTON.

THESE houses have been lately erected from the designs of Mr. H. D. Searles-Wood, F.R.I.B.A. "The Nook," shown by the upper sketch, was built for the architect's own occupation. Inside there is an interesting old oak staircase, which was taken out of a house in Burlington-street, W., and the mantelpieces came from some old houses which were pulled down in Liverpool-street when the Great Eastern Railway Company enlarged the terminus. Both houses are erected in local red bricks, and tiles for the hanging tiling. Broseley tiles are used for the roofs. The house shown by the lower view is situated on the Brighton-road, and belongs to Mr. Herbert Carty. Mr. G. Burrage, of Sutton, was the builder of "The Nook," and Mr. J. B. Potter, of the same place, erected the other house.

OLD OAK FURNITURE.

THE buffet, a beautiful piece of 16th-century furniture, is of Italian workmanship entirely, carved out of dark oak; and it is surmised from the character of the figures, angels, cherubim, &c., some of which have chaplets round their necks, that it was executed in a monastery by an order of monks who distinguished themselves in the art of wood-carving. The buffet was purchased at a sale of the furniture of the late Mr. F. C. Scott, in Swansea, and was bought by him some thirty years ago at the sale of the furniture of the late Mr. Powell at Craig-y-Nos Castle, now the residence of Madame Patti. It can be traced to have been in Mr. Powell's family over 100 years. It is in a most excellent state of preservation. The dimensions are 5ft. 3in. high, 3ft. 10in. wide, and 1ft. 3in. deep. The doors are 2½in. thick, solid, elaborately carved inside, below these doors are two drawers, together with a sliding shelf, shown partly open in the sketch. The buffet proper is supported at the two front angles by caryatides. The back of the lower portion is richly panelled, and the whole stands on a substantial pot-board. This piece of furniture is the property of Mr. Charles T. Ruthen, of Swansea, and we are indebted to him for sending us the photograph (taken by Mr. H. A. Chapman, of Swansea), from which our sketch was made. The two Italian chairs are fine specimens of design in scrollwork, showing great fertility of invention and ingenuity in producing a dignified result, the scale of the parts being maintained with considerable skill. They are located in the Bargello at Florence.

CHRIST CHURCH, HAM HILL, KENT.

THIS church was begun on the 1st March, and is to take nine months to complete. The estimated

cost is £2,000, without taking into account the tower and other work, the cost of the former being put at £600. The building is to seat about 270 persons. The church was started by the late Vicar of Birling, in consequence of the houses of Lower Birling being built almost adjoining those of Snodland. The ground has been given by the Rev. Canon Coulson, of Bramley Vicarage, Guildford. Mr. H. P. Monckton, F.R.I.B.A., of 32, Walbrook, London, E.C., is the architect. Mr. Robert Langridge, of Birling, is the builder. The church is designed in the Early English style.

NEW FREE PUBLIC LIBRARY AT STOKE NEWINGTON.

ON Saturday last Mr. J. Passmore Edwards, whose help has materially assisted its establishment, at the invitation of the Commissioners, and the leading inhabitants of the parish, opened the new Free Public Library in Church-street, Stoke Newington. We hope to illustrate the building shortly, which is certainly one of the most complete and suitable we have ever seen erected for the money.

The Commissioners procured ten designs for the new building, and selected one submitted under the motto "Spes," which was found to be that of Messrs. Bridgman and Goss.

This design was in due course sanctioned by the Local Government Board, and tenders were invited for the erection of a building in accordance therewith. Twelve tenders were obtained, the highest being for the sum of £3,262, and the lowest (that of Mr. W. M. Dabbs, of Stamford Hill) for the sum of £2,648, which was accepted, and the building is now completed.

ADMISSIONS TO ARCHITECTURAL SCHOOL, ROYAL ACADEMY, JULY, 1892.

UPPER SCHOOL.—H. P. Adams, C. W. Baker, J. Borrowman, jun., A. W. Cleaver, P. G. Newbon, R. A. Reid, A. Dunbar Smith, A. B. Yeates.

LOWER SCHOOL.—H. B. Cresswell, W. H. Hazell, T. G. Lucas, A. A. Reeve, H. A. Saul.

CHIPS.

The Queen and the Prince and Princess of Wales have decided on the design of the sarcophagus in which the remains of the late Duke of Clarence are to be placed in the Memorial Chapel at Windsor Castle. The marble for the tomb has been sent to England by the Empress of Austria. The work has been intrusted to Mr. Alfred Gilbert, R.A.

The new baths and washhouses in Roman-road, Bow, were formally opened on Wednesday evening. They have been erected from designs by Messrs. Hamor and Pinches, of John-street, Adelphi, W.C. The whole of the skylights are glazed upon the patent system of W. E. Rendle and Co. of Westminster.

Messrs. Ross, the contractors for the new Black Isle Railway from Muir of Ord to Fortrose, a distance of 13½ miles, were able to convey stock on Monday from the station at Munloch to the Highland Society's show at Inverness. The distance from Muir of Ord to Munloch is about eight miles, and although not yet passed by the Board of Trade inspector, the line is all but ready for opening for traffic. On to Fortrose the construction is, notwithstanding the difficult nature of the works between Munloch and Arroch, in a very advanced state.

At a meeting of the City Commission of Sewers on Tuesday, it was reported that the buildings on the south side of Ludgate-hill had been pulled down, and that the widening of this thoroughfare, which has been 20 years in progress, is now virtually completed.

The General Works Committee of the Coventry city council brought to a conclusion on Tuesday a protracted consideration of the question of the disposal and treatment of the sewage. Mr. Mansergh was recently consulted as an expert, and he submitted three alternative schemes, the largest of which was recommended as the most advisable. The scheme is one of broad irrigation in the Avon Valley between Brandon and Rytton-on-Dunsmore. The report will be presented to the council at its meeting three weeks hence.

The North Bierley Joint Hospital, Low Moor, is nearing completion. It is being warmed and ventilated throughout by means of Shorland's patent double fronted Manchester stoves with descending smoke flues, and patent exhaust roof ventilators and inlet tubes, the same being supplied by Mr. E. H. Shorland, of Manchester. Mr. W. Longley, of Bradford, is the architect.

WAYSIDE NOTES.

IT may surprise many persons to hear that the Channel Bridge and Railway Company (Limited) continues in existence, and on Tuesday last held its eighth ordinary general meeting. Such business-like procedure and persistence is worthy of a better cause. No one can say that the construction of a bridge across the Straits of Dover is an impossibility; but we can all point out the improbability of the thing. The success of the Forth Bridge has apparently given a certain number of people the idea that one has only to draw out a plan of a deep-sea bridge, and the lapse of a few years will see the work an accomplished fact, wind and weather not entering into the calculation. It does not require great intelligence to see the difference between proposals dealing with firm foundations, ready made, and those relating to none, or, at the least, mere shifting sands beneath a treacherous sea. In works like the Forth Bridge and the Eddystone Lighthouse there have been firm foundations to commence operations upon. The Eddystone Rock in the Channel and the Island of Inchgarvie in the Firth of Forth are substantial facts. So may be the chalk bed of the Straits of Dover, but it is not ready to hand like the other foundations.

However, the company are sanguine enough, and since the names of the big Continental engineers and Sir Benjamin Baker were mentioned by the chairman as being associated with the proposed undertaking, it is not for a mere critic to take a disparaging view of things. According to the chairman's statements, a new route—the result of careful inquiry by eminent engineers—has been chosen, with the advantage of a shorter communication and superior soil, and as a result the number of piers has been reduced from 121 to only 72, the spans being increased in size, and now measuring 400 and 500 metres alternately from end to end. Only seven years, it is said, will be required for the construction of the bridge, four years being for work in the sea itself. The cost is estimated at 800 millions of francs, or 32 millions sterling. The company, like the County Council, have great hopes of a Liberal Government; but if any Government sanctions a bridge across the Channel—presuming that its construction was possible—then Parliament will be a something that has gone from bad to worse. The Straits of Dover are quite full enough of shipping without an assembly of bridge-piers blocking the way.

With the memory of the building at Claybury still green, it is a little startling to hear that the County Council have advertised for a site for a new lunatic asylum to accommodate not less than 1,000 patients. On Jan. 1 last there were no less than 10,508 lunatics for whom the London County Council is primarily responsible to provide accommodation. These figures are as impressive as any in Mr. John Hutton's statement of the annual work of the council.

Statistics of this kind are always surprising in the totals. Thus, one would not imagine that in a single year there would be proceedings taken in 2,658 cases of dangerous structures. All these returns only go to show how vast London is becoming—an overgrown "wen," as Cobbett styled it even in his day. An appalling number of persons of unsound mind, a ridiculously large total of dangerous structures dealt with, &c., &c., are only indications of a constant and rapid growth, the borders of the Metropolis ever extending further and further from Charing Cross as representing the centre of London. On occasions when I chance to go to any district on the immediate outskirts of London that I have not visited for a number of years, I am astonished at the miscellaneous developments, and the greatly increased area covered by bricks and mortar. Not only does London grow from within—in the matter of population—but steadily swells from without, the surplus inhabitants of villages and towns in counties surrounding the Metropolis being added to the native population. Hence we may appreciate the value of the work of the parks and open spaces committee, and all who endeavour to provide more "lungs" to a body that grows so vast in size. Also we can appreciate the value of the river Thames, forming as it does a regular ventilating conduit right through the city.

The statement of amounts expended by the Council during the year is also a matter of big figures. A gross disbursement of £612,000 is made up as follows: Main drainage precipitation works and sludge ships, £170,000; asylums, £153,000; street improvements, £116,000; bridges, tunnel, and ferry, £75,000; parks, £46,000; housing of the working classes, £24,000; fire brigade, £22,000; electric testing, and weights and measures, £6,000. Receipts from Charity Commissioners, local authorities and others towards parks and open spaces, to the extent of £155,000, left a net capital disbursement for the year of £457,000. Here we find drainage, as usual, heading the list of items, and forming a fine handle for those who argue that the London system of sewage disposal is on the wrong system; while the amount laid out on street improvements is comparatively modest.

Dr. C. A. Burghardt's paper on "Sewage and its Purification," duly read on Friday last at the annual meeting of the Incorporated Association of Municipal and County Engineers, at Bury, can scarcely be regarded as satisfactory. Sewage farming and the precipitation processes were condemned alike, but the lecturer ventured no suggestions. To make some practical proposal as to the method of overcoming the difficulties named would have been the least that one would have expected.

Londoners should look to the state of their cisterns and be wary of milk. Dr. Sedgwick Saunders, the Medical Officer of Health to the City Commissioners of Sewers, reports that, though the mortality in the present outbreak of scarlet fever is low, the epidemic—if epidemic it may be called—increases. At the beginning of the month, 2,460 cases were under treatment or isolation. Diphtheria and diarrhoeal ailments are said to be on the increase. Dr. Saunders thinks the figures more significant in that this is only the commencement of the season at which zymotic diseases become more active, and states that the origin of the visitation in France has been drinking of impure water from the Seine. The warning as to water should not go unheeded. If there is to be any cholera this year, householders will do well to commence at once a system of regular and periodically cleansing and examination of cisterns and tanks, and keep it up. If they never give up the practice they will find, or may have faith to believe, that they and their families will be untold gainers in point of health.

One dreads to think of the cistern in the average small London house. If it does not contain the decaying corpses of rats or mice, it will be found to possess a deposit of a most doubtful nature, and probably also a scum on the surface of the water scarcely less inviting. The worst of it is that, even if these householders hear of the necessity for cleansing cisterns and all receptacles for drinking-water, they will generally ignore the warning. The milk question, too, is apt to be misconceived. It is imagined that the milk itself is at fault, whereas it is the passing of milk through infected atmospheres that causes the danger. Milk, it has been satisfactorily ascertained, absorbs fever and other germs as a sponge absorbs water. Thus a glass of milk standing in a room where fever rages will absorb germs or microbes, and becomes a dangerous potion to any person liable to take fevers, &c. While water should be clean, then, milk should be boiled. These facts with regard to milk ought to be made more widely known by local sanitary authorities, especially at a time when so much scarlet fever is about. The danger of dirty water and foul cisterns is more generally appreciated, although unfortunately too often disregarded.

GOTH.

Under the will of the late Mr. Edwin Smallwood, needle-maker, of Redditch, £15,000 is left for the erection of a cottage hospital in that town, and £3,000 for the building of almshouses.

The electric light is being introduced into the colleges as well as in the city of Oxford, under the direction of Mr. J. H. M. Leany, engineer to the Oxford Electric Company. On Tuesday week the inauguration of the new light took place in the dining-hall of Magdalen College. The hall is fitted up with 76 incandescent lamps of 16 candle-power, arranged in groups of four and six lights. The installations at Brasenose and Hertford Colleges will be completed within the next month.

THE RECENT ELECTION OF THE A.A. COMMITTEE.

A STORM IN A TEACUP.

IT will be fresh in the recollection of all readers interested in the welfare and progress of the Architectural Association that at the closing meeting of that body, held on the 27th May, a long and animated discussion took place as to the propriety or otherwise of the action of the committee in striking the name of Mr. Gerald Horsley off the list of candidates on the voting-papers after they had been issued to members, on the ground that Mr. Horsley had resigned his membership in November last, and was, therefore, ineligible. Mr. Leonard Stokes contended at that meeting that the resignation was immediately withdrawn, but as no record of the withdrawal and reinstatement of Mr. Horsley's name appeared in the minutes, the meeting supported the action of the committee. A fresh surprise was revealed on the presentation of the scrutineers' report, for it proved that if the votes for Mr. Horsley had been counted, he would not have been among the successful candidates. Those who were dissatisfied with the turn taken by the proceedings, decided to take steps to test the opinion of the members as to whether the whole election should not be declared null and void, and a fresh vote taken. They held that had the name been omitted from the original voting list, the votes given to that member, and now declared to have been lost, would have been distributed among the other candidates, thereby affecting the composition of the committee. A requisition signed by fifteen members was therefore forwarded to the secretaries, and in accordance therewith a special meeting was convened in the long gallery at 9, Conduit-street, W., on Friday evening last. Most of the "front-bench" members—those who take the leading part in all discussions—were present, and the proceedings were very lively. The new President, Mr. H. O. Cresswell, was unanimously voted to the chair. Mr. Gale, secretary, read the requisition convening the meeting, and also By-laws 43 and 44. He added that counsel's opinion had been taken as to whether the committee were within their rights in striking out the name of a candidate who had withdrawn from membership, and as to whether the election was thereby invalidated. He read the statement of the case, drawn up and submitted, and counsel's reply, which supported the action of the committee. Mr. C. H. Brodie, who was frequently interrupted, moved a series of resolutions, stating that "the declared result of the voting was most unsatisfactory and misleading, if not actually invalid," and directing the secretaries to issue fresh voting papers and conduct the election anew. A long discussion followed, in which Messrs. Cole A. Adams, E. Woodthorpe, Sydney R. Beale, Greenaway, and others took part. The full report of the scrutineers at the recent election was called for and read. Mr. Greenaway asked that the papers should be analysed, so as to show how many gave less than the full number of votes; but it was pointed out that it would be impossible to tell from this how the votes would have been cast had Mr. Horsley not been a candidate, and the request was eventually withdrawn. The following amendment was proposed: "That the committee having declared that one of the names placed on the voting lists recently issued was improperly so placed, this meeting is of opinion that it was properly so placed, he being a member at the time." This amendment was freely discussed, Messrs. H. D. Searles-Wood, E. Woodthorpe, W. J. Borrowghes, Leonard Stokes, Cole A. Adams, F. T. W. Goldsmith, E. S. Gale, S. B. Beale, Greenaway, and C. H. Brodie being among those who assisted in the proceedings. On a vote being taken, the amendment was carried by a large majority, and Mr. Beale's resolution lost. A hearty vote of thanks to the President closed the animated proceedings, the result of which, it will be seen, was to reinstate Mr. Horsley's name in the list of members, and to declare that the election of May 27th was a perfectly valid one, the officers and committee having been duly and properly elected.

At the Dublin police-court on Friday, John Ryan, Broombridge House, Cabra, was fined £5 for having permitted his new house, 105, Phibsborough-road, to be occupied without obtaining the written certificate of its fitness to be occupied from the city surveyor. Mr. Walter Butler, assistant-surveyor, proved the case.

CARPENTRY AND JOINERY.—XLV.

WAINSCOTING.

WAINSCOTING is the framing or boarding which occurs above the line of skirting, reaching to the height of from 3ft. 6in. to 4ft. 6in. usually, sometimes extending even higher than this. Wainscoting is to be found in the halls and kitchens of ordinary dwellings, in the form of sheeting, and in this form it may also be met with in schools and other public buildings. In better class dwellings, instead of being simply sheeting (tongued and grooved), it takes the form of framing, more or less elaborate.

In the shape of framing, it is also found in banking rooms, and the public rooms of insurance offices. As has been stated, its simplest form is sheeting. Take the case of an ordinary dwelling: it would be well if the stairs were in their place prior to strapping for the wainscoting.

With a height of 3ft. 9in. or 4ft., which would be the ordinary height, three straps would be required in the height; one say about 6in. to its top edge, the upper one having its top edge just at the height of the wainscoting, so as to serve for nailing the capping to, and of course the third one would be in the middle of these two. These straps would be fastened in some of the ordinary ways, such as by plugging the walls; or sometimes, in the case of brick-work, double hoop-iron is put in the joints where it is required, between the two folds of which the nails are driven, and these being driven through the straps previously hold them firmly. However, in many districts of the country the plugging is the universal custom. The straps should be put up to a line or straight-edge, and should be plumb to each other, unless special

to the length before putting them in their place. It may also be necessary to refrain from nailing several pieces at the end, so as to spring them in. Internal angles are readily got over, as the piece which begins to form the angle (right, acute, or

Fig. 298.

obtuse) is simply planed to fit the angle and butted against it. External angles must be either mitred, or arranged with a return head, according to the need of the case.

Fig. 298 gives two examples of finishing at the angles, one being, as is seen, that of a V or channel-jointed sheeting, and the other being that of a beaded sheeting; both drawings should

Fig. 299.

be self-explanatory, as they are simple, and such as to suit the case under consideration.

Sometimes two beads instead of one may be wrought upon the sheeting, as nowadays we have a profusion of beads introduced into many classes of work. To finish this wainscoting the only

Fig. 300.

additional feature required is a capping, which may be of a very simple kind.

Fig. 299 gives three of the more usual kinds of capping. The middle one is to be found in churches, or its place may be supplied by some other Gothic moulding or other moulding to suit

Fig. 301.

the peculiar style of architecture adopted. The capping is nailed through from the outside, being nailed into the sheeting and strap either simultaneously or alternately.

When a skirting occurs, then no scribing to the floor is done; the wainscoting may even be several inches short of the floor, reaching down so far as that the skirting will well cover it. What has been stated up to now may be spoken of as the basis of all further kinds of wainscoting. It will be readily understood when mentioned that in order to use sheeting for wainscoting in any other way than simply placing it perpendicularly or diagonally, it will be necessary to prepare by a great amount of grounding, or extra strapping—or, simpler still, by rough boarding in a similar way to counter flooring, which is, of course, used as a groundwork for a more elaborate flooring, so this rough sheeting of walls may serve as a groundwork for fancy sheeting of a vast variety of patterns, such as herring-bone and many kinds of diaper patterns.

This hint of counter sheeting opens up a way for an almost infinite variety of designs in a wainscoting composed of sheeting of the tongued and grooved class. We may pass on to other kinds of wainscoting, and these will be made up of framing. The first thing to settle will be its height, which will usually be determined by its situation. Halls have a moderately high wainscoting. State apartments of recent years have rather a low wainscoting. In one notable case coming under the writer's notice, the wainscoting in these rooms was only the height that a surbase would have been if such had been used. The decorator's treatment of the walls in regard to colour may sometimes fix the height of the wainscoting. However, the height is usually a matter strictly within the province of the architect, and the workman is only allowed a voice in some of the minor details. If the wainscoting is a low one, then there will probably be only one panel in the height; and as skirtings have

Fig. 302.

been pretty fully detailed, it only needs to be said that a suitable skirting will be adopted, and that the bottom rail of framing is usually a little wider than the top one. The panels are seldom, if ever, more than 10in. wide. The next point is the capping, which, in cases of this kind, is usually a little elaborate.

Fig. 300 gives two examples of capping suitable for wainscoting of the class being dealt with. They are given half-size. The drawings, it is hoped, are self-explanatory, and the thickness of wainscoting will be seen, and also how the joint between the capping and the wainscoting is covered by the bead extending over the front of the wainscoting. The capping is spiked against the strap, which is carried along at the proper height to receive the capping and top-rail of the wainscoting. It will be obvious from this that the strapping must be put up before the plastering is finished, or, for that matter, begun. Another strap may be carried along to fasten the bottom rail to, and also to serve for fixing any grounding to which is required for the skirting. The wainscoting may be either moulded on the solid, or the moulding may be planted in. When of oak the moulding is usually solid, but with any soft wood the *planting* is resorted to. The outline of a room is usually taken after the room is plastered, and all dimensions figured on the sketch-plan prepared for the purpose, and very often each piece of framing is set out separately on a lath or rod.

The method of joining at the angles requires a little attention. Internal angles are put together as shown in Fig. 301.

This is a very simple arrangement. As will be seen, one stile requires to be sufficiently broad to allow for the thickness of a return piece of framing going against it, and the stile on the other piece of framing requires to be the *tongue* wider.

Fig. 302 gives a sketch of how the external angles may be treated; the bead may be of any size, according to taste or design; or an *ovolo*

Fig. 297.

circumstances render it necessary to be otherwise.

The three straps being plumb to each other, will thus fill a straight-edge if it is placed against them. It would be just as well to have the architraves in their position before the straps are put up, as it will be necessary to preserve the margins down along the architraves. In the event of wainscoting extending to the stairs, the straps will require to reach forward also, and it will be necessary to have one running parallel to the string or notchboard, so as to receive the bottom ends of sheeting, and in order to nail it to. It will be understood that the sheeting will thus run up along the string-board and form a triangle.

Fig. 297 gives a skeleton outline to show this triangular joint of sheeting, where it runs up and terminates on the string.

The bottom horizontal line is that of the floor, and the top line is that of the height of the sheeting. The difficulty which would be most likely to occur in this case would be that of the wainscoting being too full for the string-board, but if it could be understood before then this should be provided for. If there is to be no skirting, then the sheeting should be scribed to the floor, each piece as it is put up. The usual way is to cut the first or starting-piece to the height after it has been scribed to the floor, and then scribe the others and nail them; the first piece should also be put up plumb edge-wise. The cutting along the top is done after it is all up, or if the distance is too great after a considerable quantity has been put up a line is drawn along, and the cutting is done by means of a panel saw, or sometimes even with a tenon saw. This cutting is a little awkward, seeing that the blade of the saw has to be held horizontal, but one soon gets used to it. As has been said, the top strap is put up, so that the top of the wainscoting will just come level with it, which makes the cutting much easier. At the termination of a side it is usual to cut the piece, or it may be necessary to cut two or three pieces

may be substituted instead, both of these being stopped if required, which will be necessary if particularly neat work is required at the capping and skirting. The capping and skirting will be mitred at the external angles, and, of course, scribed at the internal ones. A. C. SKILLING.

ST. SEPULCHRE'S CHURCH, HOLBORN VIADUCT.

THE church of St. Sepulchre, Holborn Viaduct, has been undergoing general repairs since November last, being confined principally to the exterior.

The walls to the north, south, and east of the church have had their lower portions covered with earth upon the outside to the height of 4 or 5 feet above the level of the floor inside. Owing to the continual raising of the ground by burials, extending over many long years since, this had rendered the walls in many places very damp. Open areas have now been formed between each of the buttresses, 3ft. wide and 1ft. below the level of inside floor, having retaining walls built up with brickwork in cement, the whole coped with stone. They are covered in with open iron ornamental castings laid flat, so that garden-seats may be placed upon them safely where thought desirable, thus utilising the whole of the churchyard, it having been again well laid out by the churchwardens with shrubs and flowers, in the interest of the parishioners and others who may like to take advantage of it.

During the progress of the works, and upon removing the ground, laying exposed the face of the south wall near the east corner, was brought to light an interesting portion of what may be considered the remains of an ancient crypt or underground chapel, having a small doorway and two-light window adjoining, the door forming an entrance to the crypt beneath the floor of south aisle, with window lighting the same at its side; they were both of them bricked up from the inside, no remains of the door being found but the hooks let into the jambs. The window had small slightly pointed openings, all the glass was gone; but the iron stanchion and saddle bars were *in situ*, and in good condition. There had also been a small window at the east wall of this crypt. The whole of the beforementioned being below the general level of the churchyard, was entirely hidden from view.

In an engraving of this church published in 1737, there is shown, situate at the east end of the south aisle, a retaining wall inclosing a portion of the church and churchyard at this corner, with an ornamental wrought-iron entrance-gateway at the east end, leading down by steps inside from Giltspur-street to this underground crypt or chapel; a portion of steps to it were found during the excavations. Portions of a stone-coped altar tomb were also met with, having carved mouldings at edges of same, the top being formed with raised foliated cross, having three small steppings at base of same, and small leaves at sides of stem; the whole had been terribly mutilated. This portion has been inserted in the upper part of the doorway for inspection, together with the small windows, showing the ironwork as originally executed. These are not now easily seen owing to a large stone landing being laid above and in front of them, forming the entrance to church at the east end of the south aisle. When digging for new drain at the east side of porch the remains of several stone steps, some 5ft. beneath the surface of the churchyard, were also discovered, and a small doorway leading to a crypt, beneath the floor of porch, so that a portion of the vaulting was to be seen, showing that there exists a vaulted chamber beneath entrance porch; but it is now inaccessible, being again filled up by the general raised level of the churchyard.

New stoneware-pipe drains have been laid to take the water from the roofs and inside of areas, with inspection chambers, siphon traps, and ventilation pipes, &c., throughout. The buttresses to the south side, between the windows, have been somewhat enlarged, and old stonework reinstated, as also the parapets and other portions of the exterior, having been executed in Portland stone. There has been a new roof, covered with lead, formed over St. Stephen's Chapel, situate on the north side of north aisle, constructed of oak, with moulded ribs and boarded ceiling (the whole being raised some 10ft. in height, has allowed the organ also to be raised several feet from the floor), which,

together with the form of the same, and the opening-up of the two groined arches of the aisle immediately adjoining, tend greatly to develop the sound and tone of the organ, and with its many new stops and enlarged pipes, has made it one of the finest and most effective instruments among the City churches. The whole of the walls and ceilings of the interior have been painted in silicate in several colours throughout.

The tower also has been restored by having the decayed portions of the stonework made good in Kentish rag, and where old lines of string-courses before existed an endeavour has been made to show the several original divisions or stages of the tower.

The whole of these repairs have been ably carried out by Messrs. Lidstone and Son, builders, under the direction of Messrs. Arthur and A. E. Billing, F.F.R.I.B.A., for the vicar and churchwardens.

OBITUARY.

WE regret to announce the death of Mr. Henry George Austin, F.R.I.B.A., which occurred on Sunday at his residence in the cathedral precincts, Canterbury, in the 69th year of his age. The care of the fabric of the cathedral was in the hands of the late Mr. H. G. Austin and his father, Mr. G. Austin, for about 80 years. In 1848 Mr. Austin succeeded his father as architect and surveyor to the Dean and Chapter, and he held the position until his retirement some three years since. Under his supervision many extensive alterations were carried out. Sixteen or seventeen years ago he restored the roof of the nave and refaced the clock tower, in the niches of which new figures were placed. The present library was also built by him upon the site of the old dormitories. Mr. Austin also took a prominent part in the public affairs of Canterbury, both social and political. About three years since Mr. Austin resigned his appointment under the Dean and Chapter, and retired into private life. In May, 1891, he was prostrated with an attack of influenza, from which he never entirely recovered. He was one of the senior Fellows of the Royal Institute of British Architects, having joined as a life member in 1851, and some years since served as a member of Council.

Mr. Robert Bruce, one of the most energetic labour representatives at the Dundee Town Council, died, after a severe illness, in the Epidemic Hospital, Dundee, on Friday morning. Deceased, who is survived by a widow and family, was a joiner by trade, and represented that body at the Trades Council, of which he had been president for several years. Prior to the last sitting of the Trades Union Congress in Dundee he was nominated for the office of secretary—a position to which he was eventually elected. In 1890 he and Mr. R. D. B. Ritchie, his successor as secretary to the Trades Council, were returned to the Town Council as labour representatives, the Trades Council guaranteeing them funds for their support. In the following year he secured seats at the school and parochial boards and the gas commission. In the spring of last year he contracted typhoid fever while making a tour of the slums, and inflammation of the lungs supervening, caused death, after many months' suffering in the hospital.

The Great Eastern Railway Company are about to spend £30,000 upon a new station on the main line at Colchester. The work will be begun in the autumn.

On Friday last a new national school was opened at Barnard Castle. The new buildings are near the church, and are built in two wings, at right-angles. The main school is 150ft. by 20ft., and is divided by three patent glass sliding partitions. There are four class-rooms, each 27ft. by 22ft. The school gives accommodation for 250 boys and 250 girls. The total cost was £4,600.

The Southampton Free Library committee reported last week that they had received twelve applications for the office of clerk of the works for the new library buildings, and of these they recommended the committee to select from Messrs. W. Bennett, W. N. Masters, and H. W. Willis. Bennett was residing at Liverpool, and had acted as clerk of the works during the erection of the Liverpool Exhibition; Masters was a Southampton man, residing at present at Fulham; while Willis was also a Southampton man. The two latter were interviewed and questioned, after which Mr. Willis was elected.

COMPETITIONS.

BRINTON PUBLIC BATHS.—Mr. A. Hessel Tiltman's design for the above new baths has been, on the recommendation of the Commissioners' arbitrator, Mr. Henry Currey, awarded the first premium. This is the fourth competition in two years in which Mr. Tiltman has met and beaten all comers, and on one of these occasions, as our readers may remember, he obtained the second as well as the first premium.

MANCHESTER ROYAL INFIRMARY.—At a meeting of the trustees of the Royal Infirmary, held at Manchester on Wednesday, the report of a sub-committee as to the limited competition for the extension of the building was adopted, and Mr. Alexander Graham, F.S.A., of Carlton-chambers, Regent-street, S.W., the author of the selected plans, was appointed architect. The sub-committee stated that the three sets of plans submitted for competition had received careful scrutiny, with the view to determine their several merits, their relative adaptability for furthering the best interests of the institution, their general features in respect of harmonising with existing surroundings, and in their entirety as tending to form an additional ornament to the city. The prescribed requirements had been complied with by each competing architect. Different methods, however, having been followed in working out details, the committee had had to give careful consideration to each plan with regard to its suitability to the uses intended. Two of the three competing architects had selected the Piccadilly frontage as the one best adapted for carrying out an extension. In this conclusion the sub-committee fully concurred. The sub-committee had further determined that, if the requisite extension could be effected by a three-storied elevation, such would be preferable to the addition of a fourth story. They were of opinion that each new ward should be built on the pavilion principle, and that any scheme calculated to provide four rows of beds in a ward, divided by an intervening screen, would be open to sanitary and other objections which do not apply to wards constructed on the recognised method of placing two rows of beds opposite one another against the outer walls. The sub-committee had carefully weighed the respective advantages of adopting circular walls as against longitudinal walls, and, without attempting to dogmatise on the question, they had concluded that the construction of circular towers would be so much out of harmony with the present building as to make their adoption an incongruity. The sub-committee recommended the plans—subject to minor changes in detail—of Mr. Alexander Graham, which, in their judgment, offered the largest advantages architecturally, with the fewest countervailing drawbacks. In the matter of cost, Mr. Graham submitted the following estimates: (1) Two new wings, new operating theatre, and alterations of the main buildings, £34,000; (2) extension of the nurses' home, including sanitary fittings, £5,020; (3) extension of out-patients' department and alterations thereto, £1,700—total, £40,720. If the suggestions of the committee were carried out, the increased area built upon would represent less than one-third of an acre, and the whole space then covered will be less than $1\frac{1}{2}$ acres, leaving about $3\frac{1}{2}$ acres still uncovered.

STAFFORD.—The County Council of Staffordshire, at their meeting on Tuesday, adopted the recommendation of Mr. J. MacVicar Anderson, P.R.I.B.A., the assessor in the competition for the proposed county council buildings, as already announced—viz.: 1st, £150 premium, H. T. Hare, 15, Queen-street, Cheapside, E.C.; 2nd, £100, Messrs. Treadwell and Martin, 2, Waterloo-place, Pall Mall, S.W.; and 3rd, £50, Messrs. Cooksey and Cox, 17, Buckingham-street, Charing Cross, W.C. Mr. Hare was appointed as architect, and it was decided to exhibit all the designs sent in, sixty-three in number, at the Shire Hall at Stafford.

A new clock and St. Mary's of Cambridge chimes has been added to the parish church, Giggleswick, by the masters and scholars, past and present, of the famous Giggleswick schools. Messrs. Potts and Sons, clock manufacturers of Guildford-street and Cookridge-street, Leeds, were intrusted with the order, and the new clock shows the time on one external copper dial, which is painted and gilt, 6ft. diameter, facing eastwards, the hours and St. Mary's of Cambridge chimes being struck upon the peal of six bells in the tower.

Building Intelligence.

BRADFORD.—The foundation-stone of the Central Hall for the Primitive Methodists was laid on Saturday. Its erection will entail an expenditure of £4,700. The architects are Messrs. H. and E. Marten. On the ground floor are to be two large shops, one on either side of the vestibule and entrance-hall, which will give access to the hall and existing schools, built in 1880. On the first floor will be the central hall, a room 55ft. square. Galleries are to occupy three sides, and altogether there will be accommodation for about a thousand people. The galleries will be supported on cantilevers, bolted into the outside walls. The basement is also to be let for business purposes. The contractors are—mason's work, Messrs. Humphrey and Moulson; joinery, &c., Mr. James Deacon; plumbing, Mr. G. Jackson; slating, Mr. A. Hill; plastering, Messrs. B. Dixon and Co.; ironwork, Messrs. Homan and Rodgers.

ISLINGTON, N.—The Lady Mayoress formally opened on Tuesday the second of the public baths erected for Islington. The baths stand upon a site of 2½ acres in the Hornsey-road, and include separate swimming-baths for men and women, private baths for men and women, washing and drying compartments, an establishment laundry, and the necessary steam machinery, the premises being lighted by electricity. The cost of the site was £6,000, and of buildings and machinery and electric lighting £32,000. The architect was Mr. A. H. Tiltman, whose designs were selected in competition, and the builders were Macfarlane and Co. We illustrated Mr. Tiltman's selected designs in our issue of Dec. 25, 1891.

LLANMEREWIG.—The parish church of this village was reopened on July 17th. The restoration plans were prepared by Mr. Aston Webb; but as Mr. Aston Webb was unable, by press of business, to continue to carry out the original design, it was intrusted to Mr. W. H. Spaul, of Oswestry, who, with the contractor, Mr. Aaron Watkin, of Welshpool, has successfully carried it to completion. An east window has been introduced, the tracery being a close reproduction of that of the old one.

MARKET DRAYTON.—On the 21st inst. a new cottage hospital was opened at Market Drayton. The building, which is chiefly on the ground floor, consists of a main corridor with male and female wards for four beds each with isolated lavatories, nurses' and committee rooms and garden entrance on one side, kitchen and usual offices, surgery, dispensary, and waiting-rooms, and two nurses' bedrooms on first floor. The elevations have been designed in a cottage style, and are carried out in Gnosall red bricks with Northwich red brick dressings, and with large half-timbered gables and dormers. Special ventilation has been provided by Shorland's inlet and exhaust ventilators, and Shorland's Manchester stoves have been used in the wards. The total cost has been about £2,000. The work has been carried out by Mr. John Gullimore from the designs, and under the superintendence of, Mr. John Lewis, architect, of Newcastle, Staff.

MEVAGISSEY.—The Wesleyan chapel erected here about fifty years ago has undergone complete renovation. The plain exterior has been embellished by stringcourses with pilasters in cement. Inside an orchestra has been built behind the rostrum to receive organ and choir. The whole of the chapel has been re-plastered, re-seated in pitch-pine, and an enlarged lobby erected. The plans were by Mr. James Hicks, architect, of Redruth, and the whole of the work has been carried out by Mr. Arthur Carkeek, of Redruth. The contracts are for £830, which, with the expenses of lighting, warming, and other matters, will bring the total amount to about £1,000.

The ruins of the castle at Znaim, in Moravia, a hundred feet high, fell down on Monday morning, and in their collapse two houses and a brewery were buried under the debris. Four persons were fatally crushed.

St. Mary's Roman Catholic Cathedral, New-castle-on-Tyne, which has been closed for the last few weeks, was reopened on Sunday. The handsome interior of the fine edifice has been redecorated throughout, and the electric light is now installed in place of gas.

Engineering Notes.

DERBY.—The rearrangement of the façade of the Midland Station at Derby will ere long be practically complete. Progress is also being made with the new Midland Institute opposite the station. The large new annexe to the engineers' offices is almost ready for occupation, and the duplication of the bridge at the north end of the station is being pushed forward with all despatch. The old bridge was designed by George Stephenson, and was built by the grandfather of Mr. J. D. Nowell, the contractor for the present widening.

THE MUNICIPAL ENGINEERS' ASSOCIATION AT BURY, LANCS.—The Conference of Municipal and County Surveyors at Bury was continued on Saturday. A paper on "The Utilisation of Water Power," by Mr. Herbert J. Koates, of Market Harborough, was considered. The author dealt principally with the use of water for driving electro-motors. He cited the case of Carlow, where the Municipal authorities quarrelled with the gas company, and determined to discontinue gas-lighting, and start electric-lighting. Carlow being situated at the junction of the Rivers Barron and Burren, plenty of water was available. A disused corn mill, five miles from the town, was converted into a dynamo room, the old water-wheel of the mill doing the necessary work. The wires conveying the current are carried overhead on poles to the town. The members afterwards visited the stone quarries of Sir Thomas Brooks in the Rossendale Valley. Mr. H. Bolton, of Owens College, Manchester, delivered an address on the geological features of the district. He pointed out that the millstone grit series reached their maximum development in Lancashire. Afterwards the company drove to Clough Bottom, in the water valley, where the Bury Corporation are constructing a new reservoir. The members of the Association lunched with the Corporation, the Mayor presiding. At the close Mr. James Lemon, F.R.I.B.A., the Mayor of Southampton, proposed a vote of thanks to the Corporation of Bury for the hospitality shown to the Association. Mr. Dyack, of Aberdeen, seconded the motion, which was heartily carried. This concluded the meeting.

Mrs. Burne Jones makes an appeal on behalf of the South London Art Gallery, in Peckham-road, for a loan of pictures during the months of August and September, and adds: "A most generous gift has lately been made to the institution for the purpose of building a lecture-hall and library in connection with the picture gallery, and many books have been already promised for it, but others will be wanted."

The Parisians have decided to clear the ruins of St. Cloud, associated with the memories of Henri Quatre and Bonaparte, and to convert the site, as has already been done with the remains of the Tuileries, into a garden. The ruins were sold by auction on Monday, and were secured by M. Kessel, a Parisian builder, for £133 sterling—a miserably low figure when it is remembered how many "relics" can be manufactured from the fragments.

Messrs. John Morris and Son, architects and surveyors, of Bolton, have been appointed by the assessment committee of the Stockport Union to make a valuation of the following works in the union: Cotton factories, hat works, bleach and print works, foundries, machine and engineering shops, sawmills, timber, slate, and flag yards, linoleum works, wool factories, paper works, corn-mills, warehouses, small workshops, bobbin works, &c. The union comprises 17 townships, and the rateable value is £571,011.

At the Edinburgh Dean of Guild Court last week a warrant was granted to the trustees of the Merchiston United Presbyterian Church to erect a new church at Polwarth Gardens. The building will be in the Late Gothic style, and the plans show a handsome frontage and a well-proportioned spire, rising to a height of 120ft. Accommodation is provided for 600 in the area, and for 265 in the gallery. Mr. David Robertson, Maitland-street, Edinburgh, is the architect.

On Saturday afternoon the Duchess of Teck performed the ceremony of laying the corner-stone of the new church of the Good Shepherd, Mansfield-road, Gospel Oak, N.W. The new church is to take the place of a temporary building close by. Only the nave is to be built at present, at a cost of £8,000, of which about £4,000 has been given or promised. Messrs. James Brooks and Son are the architects, and the church was illustrated in our issue of the 17th ult.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

ARCHITECTURAL ASSOCIATION EXCURSION, 1892.—Taunton will this year make the headquarters of the excursion party of the Architectural Association, from August 15th to 20th, and the places finally settled to visit are as follows:—Bridgewater; Cannington Manor; Guernsey-street Farm; Blackmore Farm; Spaxton Manor house and farm; East Quantock Head Hall; Nettlecombe; Combe Sydenham; Minehead church; Dunster castle; Cleve Abbey; St. Decumen's church; Trull, Poundisford Park; Ruishton church; Creech St. Michael and Kingston-St. Mary; Cothelstone Manor house and gateway; Bishop's Lydeard church and Bishop's Hull. The secretary of the excursion who has the details of the programme in hand is Mr. H. D. Searles-Wood, F.R.I.B.A., who for many years has arranged these enjoyable outings.

LEICESTER MASTER BUILDERS' ASSOCIATION.—The annual dinner in connection with this Association took place on Thursday night, July 21st, at the Bull's Head Hotel. The chair was occupied by Mr. D. Garrett, the president, and the vice-chair by Mr. E. B. Pipes. Mr. Hardington proposed "The Leicester and Leicestershire Society of Architects," coupled with the name of Mr. A. H. Paget, the president of the Leicester and Leicestershire Society of Architects, who responded. Mr. S. P. Pick, secretary of the Society, proposed the toast of "The Leicester Master Builders' Association." He referred to a circular-letter which had been sent to the architects with regard to builders tendering from specification and drawing only. It was not possible for builders to give a legitimate price from these alone, and unless something more definite was placed before them they could not do justice to themselves, the architects, or their clients. Mr. Garrett, in responding as president of the Association, said that they had had some correspondence with respect to the conditions of contract. Seeing that the matter was now being considered by the National Association of Master Builders and the Royal Institute of British Architects they could well afford to wait and see what they proposed before the local association attempted to adopt anything for themselves. The toast of "The Town and Trade of Leicester" was also drunk, proposed by Mr. E. B. Pipes.

CHIPS.

The vestry of St. Mary, Islington, held a special meeting on the 22nd July to consider a report from Professor Henry Robinson with reference to the electric lighting of their district, and it was unanimously resolved to apply for a provisional order under the Electric Lighting Acts.

New national schools were opened at Marston last week. The architect was Mr. M. K. Ellerton, of High-street, Northwich. Mr. T. Leicester, builder, of Northwich, was awarded the contract, the amount of which was £1,310. The total expenditure will, however, reach about £1,660.

The King's Bridge at Eye, Suffolk, built in 1705, is now being reconstructed for the town council and West Suffolk County Council. Messrs. W. and F. Rampling are the contractors.

Arrangements have at length been made for laying the foundations for the monument to the memory of the late Earl of Shaftesbury on the site granted by the London County Council at Piccadilly-circus, immediately facing Shaftesbury-avenue. The monument, as is well known, will take the form of a fountain, the work of Mr. Alfred Gilbert, A.R.A. It will be octagonal in form, and in bronze, and will be about 36ft. in height from the ground line.

The Master of the Mercers' Company visited Horsham on Monday and laid the foundation-stone of a new grammar school, which is to be erected in that town. The school was founded in 1540 by Richard Collier, a wealthy London mercer. It is now intended to enlarge the scope of its work.

On Saturday afternoon four corner-stones of a new chapel and schools for the Wesleyan Methodists of Berry Brow, near Huddersfield, were laid. The chapel is to accommodate 450 persons, and the school 400 scholars, and the estimated cost is £3,500. The style adopted is the English Renaissance, and the buildings are being erected from designs of Mr. Lockwood, Huddersfield.

The thirty-fifth annual meeting of the Kent Archaeological Society was held at Dover on Tuesday and Wednesday week, under the presidency of Earl Stanhope. Visits were paid to St. Mary's Church, St. Martin's Priory, the Castle, the Museum, and Temple Ewell and Alkan Churches.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C. and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLII., XLVI., XLIX., L., LI., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

J. H. THOMAS. (Write the Secretary of the Institution of Surveyors, 12, Great George-street. It is by far the most alive of the professional societies, and in every way a credit to belong to it, and its secretary is always courteous and painstaking in giving information to all.)

RECEIVED.—B. R. G.—J. M. and Y. R. Co.—T. M. L.—Gov. Inspector.—F. G. W. Co.—Oxonian.

Intercommunication.

QUESTIONS.

[18819].—**Gas Regulator.**—Can any of your readers tell me which is considered to be the best regulator for fixing on gas meters (for a large number of lights supplied through a 2in. main)?—F. J. BARNES.

[18820].—**Adjoining Premises.**—Will any of your numerous readers kindly inform me what is best to do in the following case? I am building an addition to a house. The side wall is the boundary wall, and the owner of the adjoining premises has recently built an addition to his house, and the side wall is built within 5in. to the boundary wall, and he has not fixed landers along the eaves, and the rain comes down on the new wall, and if he refuses to put up landers the side wall of my building will always be damp. The other building is much larger and loftier than mine. I have no objection for him to bring his ladders on my grounds for him to do the work. I wish to know, can I compel him to put up landers, &c., or what is best to be done in this case?—W. W.

[18821].—**Cemetery.**—Is there any work published on the laying out of a cemetery, and the general duties of the surveyor to a burial board?—NECRO.

[18822].—**Copying by Reflection.**—Sometime ago the idea occurred to me of copying architectural or other large drawings (or even prints or printed matter) by means of simple reflection—viz.: If a highly-polished narrow speculum (or even a piece of polished glass) be placed in close contact with a drawing in the sunlight, the lines of that portion of the drawing coming closest in contact with the speculum will be thrown off again with more or less definition, according to the circumstances. Now my idea is to utilise this fact, and to employ sensitized paper to obtain positive copies of any drawing in good clear lines, and without injury to the same. The method I propose to employ is to fix up two narrow rollers, somewhat after the fashion of a miniature mangle, with spring and toothed-wheel arrangement for revolving the said rollers uniformly, and at varying speed, according to the desired period of exposure to the light. One roller would contain the drawing, and the other the sensitized paper, both of

which would be so arranged that the speculum (a mere bar extending the length of the drawing, &c.) could receive the lines of the drawing as they passed under or above its edge, and reflect them again on to the sensitized paper, while it, too, was momentarily exposed to the influence of the speculum. The difficulty is the arrangement. Can any of "ours" suggest a good arrangement?—COLOUR BRUSH.

REPLIES.

[18807].—**Measuring Stone Cornice.**—I send

sketch and the proper method of measuring. Length of cornice, &c., 10ft. :-

ft.	in.	
10	0	
1	0	
10	0	Plain face to cornice.
1	0	
10	0	" " weathering.
1	6	
15	0	Moulded face.
10	0	
10	0	
8	4	Plain face blocking.
7	6	" " "
10	0	
7	6	Plain weathering.

Dowels, cramps, sunk and cement grouted joints, each, joint (between two stones) extra. If wall below cornice is of stone, add extra for grooving for flashing 10ft. run.—THOS OLLERENSHAW.

Legal.

INTERESTED ARBITRATORS.

IN one sense, it very often happens that an arbitrator upon a building contract, and who is also the architect or engineer, is really an interested party. But this form of arbitration, by which all litigation is rendered practically impossible, has become so usual in the building trades—while the arbitrators thus appointed are relied upon with all confidence to act honourably to all parties—that their peculiar position is rarely regarded. But although this is so, and the fact is matter for congratulation, and although the Courts have determined to enforce their arbitration clauses in all their stringency, and so keep out lawsuits, still there are instances in which such an arbitrator does really get himself too much mixed up in the matters upon which he will have to arbitrate to be regarded by the law as a proper judge, at all events technically, although personally he might do everyone justice. When this does occur the Court will interfere to put an end to the arbitration agreed upon, but they do so rather reluctantly, and only upon a strong case.

A recent striking example of this was the matter of some contracts between Baring Bros. and Doulton and Co., in which an application was lately made to revoke the submission to arbitration (*Times*, 16 July). The contract was for the supply of materials for the erection of large waterworks at Buenos Ayres, and it contained the usual stringent clause, under which the engineers were sole judges of every question arising out of, or in connection with, the work and the contract, and their decision should be final and binding on both parties. The engineers were a firm which practically consisted of one member who had attended to the works and issued the certificates for the last three years. There was now a dispute as to some thousands of pounds for balance of account due to Doultons, met by Barings with a counter-action for damages for delay in delivery, and Barings now objected to the engineer being sole arbitrator, as he was made under the

contract, on the ground that he had himself brought actions against Barings and the contractor for commission he claimed. Under these circumstances, it was stated that the engineer must be biased, though unintentionally, and a correspondence was read which showed that there had been some warmth of feeling shown by him in the matter. The Court, although admitting that the engineer probably knew more about the facts and the contract than any other man, and although unwilling to interfere in such an arbitration, yet thought things had gone too far, and held that, as there must in all probability be some bias in the mind of the engineer as single arbitrator, they, without imputation of wrongdoing, revoked the submission to arbitration contained in the contract.

FRED WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning to insure answer same week.

LEGAL INTELLIGENCE.

A BIRMINGHAM BUILDER'S MISFORTUNE.—William Henry Chaffer, builder, of 8, Warstone-parade, Birmingham, attended the offices of the official receiver, Colmore-row, last week, to meet his creditors, none of whom, however, made an appearance. The debts amounted to £918 16s. 3½d., and assets, consisting chiefly of surplus from securities in the hands of creditors fully secured, £494 14s. The debtor began business in Branstreest in 1862, with £40 capital, and in 1872 paid his creditors a composition of 10s. in the pound. In 1874 he erected the premises at 8, Warstone-parade, but in 1886 he was much crippled by a loss of £300 by fire, a shop and contents being consumed, for which he was insured only to the extent of about £30. In 1889 he erected 40 houses in Foundry-road; but he lost money on them. He had been ill since last year, and certain work was taken out of his hands because his illness prevented him from completing it. A portion of the furniture is claimed by the debtor's wife. Being a summary case, the affairs are left in the hands of the Official Receiver.

DISPUTE AS TO QUITTING A QUARRY.—Judgment was given by Lord Stornmouth-Darling on the 20th July in an action by G. and R. Cousin, builders, Alloa, against John Proctor Kyd, solicitor, Dundee, trustee of the deceased James Gentle, builder, Dundee, in which decree was asked for £1,000, as loss and damage said to have been sustained by the alleged failure of the defender to leave Fallows Quarry, on the estate of Strathmartine, of which pursuers are now tenants, in a proper state and condition for working, in terms of the lease. Defender said that the quarry was worked in a proper manner, and that it was left in a proper state and condition, all the obligations of the tenants having been duly fulfilled. The case turned upon the removal of two heaps of rubbish, and his Lordship gave decree for £170 as a sum to cover the cost of their removal, and granted expenses to the pursuers, subject to modification.

IS A URINAL NECESSARILY A NUISANCE?—GRAHAM V. THE CORPORATION OF NEWCASTLE-ON-TYNE.—In the Queen's Bench Division on Saturday, before Mr. Justice Kekewich, the owners of certain houses in Charlotte-square, Newcastle-on-Tyne, applied for an interim injunction to restrain the corporation from proceeding with the erection of a public urinal in the square. It appeared that, by the conveyances under which the plaintiffs claimed, one being dated in 1876, all mines and minerals, and all powers and privileges for working the same, were reserved to the corporation, the grantors, and each conveyance contained an agreement (admitted to be equivalent to a covenant) by the corporation that "the garden or open space" in the square "should for ever thereafter be kept open and unbuilt upon." The corporation had commenced erecting a urinal in the square, the whole being intended to be covered with a cemented and glazed roof, projecting very slightly above the adjoining surface of the garden. The plaintiffs now moved for an injunction to restrain the corporation from proceeding with the works on the ground that they constituted a breach of covenant, and that the urinal itself would create a "nuisance." Mr. Justice Kekewich observed that the plot of ground in question had admittedly been kept, not as a flower or kitchen garden, but merely as an open space. It was, under the covenant, to "for ever thereafter be kept open and unbuilt upon." That meant no more than this—that, being a garden and an open space, it was to be remain "open" in the sense of being unbuilt upon. The words "and unbuilt upon" were merely an enhancement of the word "open." The ground might be built on to some extent and yet remain "open." For instance, a greenhouse might be erected upon it. The words

"and unbuilt upon" were meant only to emphasize the word "open." The building proposed by the defendants was not such a building as would interfere with the surface being kept open. On that point, therefore, the plaintiffs failed. With regard to the other point—the question of nuisance—it was impossible to say that a public urinal was necessarily a "nuisance." That was negatived by the decision in "Vernon v. Vestry of St. James, Westminster," where it was decided by the Court of Appeal that it was possible to have a public urinal without its being a nuisance, even in a large crowded town. His Lordship was not satisfied that a nuisance would be occasioned, but if the plaintiffs established a case of nuisance hereafter they would be entitled to their full remedy. The present motion must, therefore, be refused, but the costs of it would be costs in the action.

ACTION FOR SLANDER BROUGHT BY A BUILDER AGAINST AN ARCHITECT.—At the Assizes at York, on July 22nd, Mr. Justice Day heard an action for slander brought by Mr. Richard Martin, builder and contractor, York, against Mr. Charles Anderson, architect and hotel keeper, York, a member of the York County Council. The damages were laid at £100. At the end of last year the plaintiff contracted to make considerable alterations and improvements in the hotel occupied by the defendant. During the progress of the work disputes arose between the parties. About the end of February it appeared that defendant lost a book on which he seemed to set some value, and he commenced an investigation, during the course of which he distinctly charged one of his servants, named Marion Carr, with having stolen the book and given it to the plaintiff. Counsel submitted that this amounted to a charge that plaintiff had either received the book knowing it to have been stolen, or had induced the girl Carr to steal it for him. At the conclusion of the plaintiff's case, the learned judge, without calling on the defence, held that the words used under the circumstances in which they were used did not convey any imputation of felony. In his judgment, no rational being would ever have thought of bringing such an action. It was really monstrous that the public time should be occupied with such ridiculous cases. He gave judgment for the defendant, with costs.

IN RE C. H. WILLIAMSON.—Under a receiving order granted against Charles Herbert Wilkinson, contractor, of 3, Salters' Hall-court, City, a statement of affairs has been submitted showing liabilities £37,578, of which £70,483 are unsecured. The available assets, which are returned as of nominal value, appear to be wholly absorbed by preferential claims, book debts amounting to £29,867 being considered bad. The debtor, having been for some time manager to a building and tramway contractor, entered in December, 1885, into partnership with another person, and they commenced business at 22, St. Mary-axe, E.C., without capital, as contractors (chiefly in rails and tramways) under the style of "Wilkinson and Co." In 1886 they removed their offices to Salters' Hall-court, E.C. Since the dissolution of partnership in 1890 the debtor has traded alone. The Official Receiver states that the greater part of his indebtedness is in respect of money borrowed and liabilities incurred in connection with contracts for the construction of rail and tramways, which were unfinished at the date of the receiving order. The debtor's insolvency is attributable to the failure of the directors of a railway company to carry out their part of a contract for the construction of a railway to Ireland; also to a depreciation in value of shares taken by him in part payment of contracts, and to law costs and expenses. An adjudication of bankruptcy has been made, and a trustee appointed with a committee of inspection.

THE ARCHITECT AND HIS DUSTBIN.—*ELLIS V. THE STRAND DISTRICT BOARD OF WORKS.*—(Court of Appeal, July 26, before Lords Justices Lindley, Lopes, and Smith.)—This was an appeal of the defendants from a judgment of the Queen's Bench Division, which was in favour of the plaintiff. The action was brought by an architect and surveyor carrying on business in Essex-street, Strand, to recover damages from the defendants for alleged refusal and neglect to collect and remove his house-refuse, in consequence of which neglect the plaintiff said he had suffered in health. The defence was that all that was usual and necessary had been done in the matter, and that all complaints by the plaintiff had been properly and promptly attended to. It was also submitted on behalf of the defendants that, as they had contracted with a sub-contractor to remove all the refuse in the Strand district, they had fulfilled their duties, and although the sub-contractor had not done the work, having become bankrupt, the defendants were relieved from liability. The action was tried before Mr. Justice Grantham and a common jury, and was fully reported in our issue of May 20 last (p. 719, Vol. LXII.). His Lordship then held that the defendants' contention could not be maintained, and the jury gave a verdict for the plaintiff for £75 damages, hence the present appeal. Lord Justice Lindley said the statutory duty of the vestry was

either to employ a sufficient number of persons to remove the dust and rubbish or to contract with others to get the work done. Here they had performed their duty by contracting with others, and Mr. Justice Grantham made a mistake when he told the jury that it was the duty of the vestry to have removed the refuse. The vestry took a right view of their duty, and the appeal must, therefore, succeed, and judgment must be entered for the defendants. Lords Justices Lopes and Smith concurred. Judgment accordingly. An attempt made by plaintiff on Wednesday to reopen the case by way of further appeal failed.

THE ARBITRATION AS TO THE LONDON TRAMWAYS.—The inquiry to assess the amount to be paid by the London County Council for the acquisition by them of the whole of the system of the London Street Tramways Company, which was authorised by Parliament in 1870, commenced on Wednesday at the Surveyors' Institution, Westminster, before Sir Frederick Bramwell, C.E., sitting as arbitrator. The system which is the subject of this inquiry runs from Euston-road to Parkhurst-road, Holloway, and from King's-cross to Kentish Town. Sir Frederick Bramwell will, after hearing the case, make two awards—the first award to be on the basis of the company's contention that the system should be purchased as a going concern, regard being had to future profits; and the second award upon the basis of the County Council's contention that all that Parliament intended them to pay is the actual cost, apart from all profits, of the metals, stables, tramsheds, and other property of the company. By adopting this method of assessing the sum to be paid by the County Council the question of the correct interpretation of the section under which the tramways of this and all other London companies may be purchased will be argued and decided in the Courts.

EMPLOYERS' LIABILITY ACT.—In the Edinburgh Sheriff Court on Monday, an action was raised by John Gibson, joiner, Corstorphine, against John Muirhead, builder, North St. Andrew-street, Edinburgh, for £400 damages for personal injuries. On the 22nd December last, while the pursuer was working for the defender at the Princess Theatre, Edinburgh, the defender's superintendent, Robertson, fell from the front of the gallery on to a scaffolding on which the pursuer was working, causing it to give way. Both men were precipitated to the ground, a distance of about 13ft., and the pursuer sustained severe internal injuries. Sheriff-Substitute Hamilton dismissed the action, finding the defender entitled to expenses. In a note the Sheriff says that he was unable to sustain the relevancy of the action. The case disclosed on record as it appeared to him was one of pure misadventure, for which no one could be held legally responsible.

WATER SUPPLY AND SANITARY MATTERS.

ECCELSFIELD, SHEFFIELD.—Mr. D. Balfour, M.Inst.C.E., F.G.S., of Newcastle-on-Tyne, has been engaged by the Wortley Union rural sanitary authority to report on a scheme of sewage disposal for the town of Ecclesfield, near Sheffield.

MIDSOMER NORTON.—The board having applied to the Local Government Board for sanction to borrow £3,200 for purposes of sewerage, and £500 for the purchase of land for the purposes of water supply, a public inquiry was held at the Market Hall last week by Major-General Henry Darley Crozier, R.E., Government Inspector. The scheme promoted by Mr. Lailey is that known as the international process of precipitation and filtration. Mr. W. B. Beauchamp strongly criticised the scheme, with the view of eliciting the question of treatment in the sewers, the exclusion of the subsoil water, which largely percolates detrimentally into the existing sewer, and to the proposed cost of the treatment, which, he considered, would be excessive. The Commissioner and Mr. Lailey considered that the entry of the water into the sewer would not be detrimental to the satisfactory working of the scheme. Dr. Angell was of opinion that the subsoil water would be beneficial, inasmuch as it would assist in the oxidation of the filter beds.

CHIPS.

The death occurred last week of Mr. Henry Stevens, builder, of Eastbourne, who had erected more than a hundred houses and shops in that town, besides extensive additions to the New College and other public buildings. He is succeeded by his son, Mr. George Stevens.

A new hotel, the Atlantic, has just been built at Newquay, Cornwall, from designs by Mr. Silvanus Trevaill, of Truro. Messrs. Lang and Son, of Liskeard, were the contractors.

The new parish church of Earlston, near Edinburgh, was opened on the 6th inst. The church has been built from plans by Messrs. Hardie and Wright, architects, Edinburgh, at a cost of about £3,000.

Our Office Table.

A SPECIAL meeting of the County Council was held last Friday to further consider the Strand improvement scheme. After a long discussion, and the rejection of several amendments, it was resolved to apply to Parliament next Session for power to construct a new street from Holborn to the Strand, that provision be made in the Bill that the holders of property benefited by the improvement should contribute towards the cost; and that unless Parliament sanctions an equitable division of the cost between the owners of ground values and the occupiers, the scheme shall not be further proceeded with. This practically settles the business, we expect.

THE annual report of the Metropolitan Police Force, issued on Saturday, gives some interesting particulars as to the yearly growth of the Metropolis in respect to houses and streets. It must be premised that the police district is literally Greatest London, having the largest area included under that title. The district extends over a radius of 15 miles from Charing-cross, exclusive of the City of London and its liberties, and embraces an area of about 688 square miles. The rateable value of this area for 1891 was a good deal over £36,000,000. Last year more than 12,000 houses were added to the total in this area, constituting nearly 23 miles of streets. Since 1848 more than 500,000 houses have been built, and the new houses and squares have a length of nearly 2,000 miles. It is noteworthy that the houses are not springing up now at the same rate as in some past periods. In 1881 the addition exceeded 26,000, with 86 miles of streets.

DR. P. L. SCHLATER, the energetic secretary of the Zoological Society, writes to the daily Press, suggesting that the site of Her Majesty's Theatre, now being cleared, probably to be covered with a large hotel and shops, could be better utilised for housing the Royal Academy, leaving the whole of Burlington House for the accommodation of the scientific societies. He points out that Burlington House affords insufficient space to the picture galleries, and also for the accommodation of the Academy students, and urges that no more appropriate site for a new Palais des Beaux Arts could be imagined than that now vacant in the Haymarket. Possibly not; but we should suggest that the bodies to move and seek new quarters should be the Royal, Geographical, the Antiquaries, Chemical, Astronomical, Geological, and Linnean Societies. And surely these bodies are sufficiently wealthy to rent or build their own meeting rooms.

We are threatened with yet another watering-place on the Lancashire coast, probably to be dubbed either Cliftonville or Fairhaven. A large slice of the sand hills between Lytham and St. Anne's, which are at present an immense rabbit warren, has been purchased by Mr. T. Riley, a Fleetwood contractor, from Mr. Clifton, of Lytham Hall. The land purchased is about a mile broad in its widest part, and one feature of it is a natural promontory, extending a considerable distance into the sea, and behind it is a lake covering several acres. Mr. Riley will block up the entrance to this lake, and make provision for filling it at high tides. It is to be stocked with sea-fish, and bordered with a promenade and carriage-drive, to be extended along the shore. Operations have already been commenced.

THE annual meeting of the British Institute of Public Health will be held next month in Dublin, the dates fixed on being August 17th, 18th, and 19th. The congress, both from a scientific and social point of view, promises to be very successful. The meeting will be presided over by Sir Charles Cameron. Papers of public interest will be contributed by the medical officers of health of some of the most important cities and towns in England and Scotland, and the inaugural address will be delivered by the President at the Royal College of Surgeons on Wednesday, August 17th, at 11 o'clock, and on the evening of that day the members will be entertained to dinner at the Lucan Hydropathic by the board of directors. On Thursday, the 18th, the annual dinner will take place at the Royal Marine Hotel, Kingstown, and Sir Henry Cochrane, D.L., chairman of the Dublin Waterworks Committee, will entertain the Institute at the Vartry works at Roundwood on the third day

of the meeting. Other excursions are also in contemplation. The honorary secretary to the meeting is Mr. D. Edgar Flinn, D.P.H., F.R.C.S., of Kingstown.

The sand-blast is now being used in New York for cleaning the marble exterior of the United States Assay Office, in Wall-street. The apparatus consists of a "gun," in the shape of a sheet-tin tube, 3ft. long and 3in. in diameter, which is bent into a goose-neck at one end, and terminates in a 2in. nozzle. A second tube 1in. in diameter enters the first at the upper bend of the goose-neck, and terminates about 3in. inside, being central with the nozzle. The sand is fed through this tube from a hopper, and is projected against the work by an air-blast through the outer tube. It is said that, with an air-pressure of 2lb. per square inch at the nozzle, 1sq.ft. of marble will be abraded to a depth of 1-32in. to 1-64in. in one minute, leaving a fresh, clean surface.

The United States Consul at Catania, in his last report, says that visitors at Catania invariably notice the peculiar soft pink colour of all the unpainted buildings. This colouring is the result of using cement or mortar of proved value, found in the vicinity, and which is nothing more or less than burnt clay. In the frequent eruptions of Mount Etna in times past great beds of clay were covered and buried from 20ft. to 200ft. by the lava streams, with the result, when the eruption happened in the dry season, of burning and converting these clay beds into a fine red gravel or powder. These deposits are mined, and are considered very valuable. The material, mixed with a little lime and the usual amount of water, forms a mortar or cement considered superior to any other cement for building purposes, and has been used in Catania to the exclusion of all other materials for centuries. Every building in Catania is constructed of lava liberally cemented with this mortar. In building, small irregular stones are used just as they happen to come, and a smooth surface is afterwards given by a thin coating of mortar, inside and out, which can then be divided by a trowel to imitate blocks of stone, if desired. This burnt clay, with lime, makes a very strong and adhesive mortar; no other material would hold together the large four and six-story apartment-houses, which are built entirely of small irregular stones. It also has unequalled wearing and resisting power, as the extensive harbour breakwater proves.

The Queensland Institute of Architects and the Builders' and Contractors' Association have adopted a form of conditions of contract which in the main conforms to those generally used in this country, and it is rather remarkable that so many of the professional representative bodies in America and the Australian colonies should have turned their attention to the subject of late. There is, no doubt, room for improvement in some of the forms of contract that have been proposed; but generally they have all been framed on the conditions which have been adopted in the old country, and which have been found by experience to be necessary. In every case a representative committee of experienced and competent architects and responsible contractors is the proper authority to undertake the publication of so important a document.

The Legislature of Massachusetts has just passed, without material change, the building-law for Boston which was drawn up two years ago by a commission of three members: Mr. Minot, representing the real-estate owners; Mr. Stearns, of the firm of Peabody and Stearns, representing the architects; and Mr. Sayward, the Secretary of the National Association of Master Builders, and of the similar local society, and himself a builder of great experience, as the representative of the builders. According to the *American Architect*, the law proposed by these commissioners is in many ways far superior to anything of the kind yet devised. In lieu of being an incoherent mass of rules, founded on the model of the Metropolitan Building Acts of London, as are those of most American and European cities, it is arranged on an independent plan, by which all city buildings are divided into three classes, and the detailed regulations for each class are clear, condensed, and scientific, embodying the conclusions long ago reached by architects, builders, underwriters, and fire-engineers in a practical form. The new broom appears likely to sweep clean, and pending the discovery of loop-holes and impracticable clauses,

the architects and builders of Boston are pluming themselves on possessing the best building code in the world.

The Worshipful Company of Carpenters, in conjunction with the Council of King's College, inform us that the following students have gained prizes or certificates in Professor Banister Fletcher's classes:—1st year: A. W. Makovisky, R. O. Fieldon, F. Clark, Wearing H. J. Mather, W. H. Gurney, S. F. Trill. 2nd year: Trimmell, Allberry, E. C. P. Monson, H. J. Adlard, A. G. Dixon, T. A. Watson, F. W. Bateman, A. A. Dixon. Evening classes: S. Jeffree, E. C. P. Monson, J. R. Johnston, C. J. Aston, F. C. Higgins, T. C. Yates, H. M. Lawson, A. C. Long, F. Mayell, Woodward, E. Searchfield, H. C. Cregeen, H. Allberry, P. Ross.

Trade News.

WAGES MOVEMENTS.

BOLTON.—The strike of plumbers and glaziers at Bolton, which has extended over twelve weeks and brought about a general lock-out in the building trade there, was settled last week by arbitration, and work was resumed on Monday. The trouble arose over rules relating to time of starting in winter, and out of town allowance. The umpire's award places the men on the same footing as those in Manchester and other large towns.

NORTH WALES SLATE TRADE.—At the North Wales slate quarries matters are very unsettled, owing to the refusal of the employers to grant an advance in wages. By a small majority the members of the North Wales Quarrymen's Union have decided that it is inexpedient to turn out at the present juncture; but at some of the quarries, such as that belonging to Lord Penrhyn at Bethesda, there is a strong feeling in favour of a strike.

CHIPS.

Mr. Arthur Turley, of Carlisle, has been appointed surveyor to the local board of Eccles.

Among the works of decoration now being carried out by Messrs. Campbell Smith and Co., of Newmarket-street, W., may be mentioned the Alhambra Palace and Cavour Restaurant in Leicester-square, the Egyptian Hall in Piccadilly, the Hotel Metropole at Brighton, and the Theatre Royal at Bath.

The proprietors of the Royal Institution at Liverpool have under consideration a proposal to remove the valuable William Roscoe collection of old masters' pictures and casts from the Gallery of Art, Colquitt-street, where they are seldom seen, and house them in the Walker Art Gallery, where they will be easily accessible.

The Canadian Dominion Parliament has appropriated 10,000dols. to the purpose of erecting a statue to the late Sir John A. Macdonald. It is intended to invite competitive designs from Canadian and European artists.

The Marchioness of Lorne on Saturday opened the new building situate on Kingston Hill, which has been secured for the Princess Louise Home.

The Grosvenor Club has made arrangements to receive paintings from artists and others, to be hung in the galleries now used as reading and drawing rooms. The first exhibition will take place in October.

Minnis's drapery premises in Lavender Hill, the fatal fire whereat was the subject of a protracted coroner's inquest this spring, have just been reconstructed. Mr. Henry Branch, of Cheapside, was the architect, and Mr. W. Hammond, of York-road, Battersea, the builder.

St. Nicholas Church, Rochester, which was badly damaged by fire last winter, has been restored by Messrs. Collard and Son, builders, and the Bishop of the Diocese will reopen it on Sunday next.

At the last May exams. in building construction the students of the City of London College, under Prof. Henry Adams, obtained 29 places in the Elementary stage, 14 in the Advanced stage, and 2 in the Honours stage: representing a success of 93½ per cent., and over 40 per cent. obtained first-class certificates. An increased prize list is announced for the next session, commencing Oct. 1.

Major-General Crozier, R.E., and Mr. Burd, Local Government Board inspectors, held an inquiry at Wigan on Tuesday into an application by the Wigan corporation for sanction to borrow £70,000 for the purposes of their gas undertaking.

Holloway's Pills purify the blood, soothe and strengthen the nervous system, give tone to the stomach, elevate the spirits, and, in fact, make the patient sensible of a total and most delightful revolution in his whole system. They may be recommended most unreservedly as the very best family medicine in existence.

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY. SOLE AGENTS for England, J. & A. CREW, Cumberland Market, London, N.W.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—THE HAM HILL STONE COMPANY, NORTON, STONE-UNDER-HAM, SOMERSET. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 28, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS, MAHOGANY, WALNSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C. The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ASHFORD, KENT.—For the erection of a bacon factory (exclusive of machinery). Mr. Henry J. Jeffery, M.S.A., architect. Quantities by the architect:—

Baker, W., Ashford...	£3,600	0	0
Denne, W. and T., Walmer	8,480	0	0
Steddy and Co., Ashford...	3,457	0	0
Jarvis, J., Tunbridge Wells	3,445	0	0
Howland, C., Ashford...	3,311	0	0
Wood, J., Ashford...	3,300	0	0
Wallis and Sons, Maidstone	3,264	0	0
Denne, G. H., and Son, Deal	3,249	0	0
Joy, E., Ashford...	3,125	0	0
Knock, H., Ashford...	3,000	0	0

BISLEY.—For two pair of semi-detached villas at Bisley. Mr. R. P. Hammond, Regent's Park, N.W., architect:—

	A.	B.	Credit, old	Total.
			Material.	
Harris, Woking	£821	£204	£30	£1,055
Dinell, London	903	883	10	1,676
Winslade, Chobham	797	883	20	1,660
Norris, Sunningdale	760	890	15	1,635
Peters, Horsham	780	885	15	1,630
Spooner, Bagshot	775	853	98	1,593
Nesmyth, Chertsey*	760	840	17	1,583

* Accepted.

BLAINA, MON.—For the erection of a Wesleyan chapel and schools at Blaina. Mr. F. R. Bates, Newport, Mon., architect:—

Welsh, H., Hereford	£2,420	0	0
Lock, C., Newport	2,335	0	0
Diamond, T. G., Newport	2,310	0	0
Jones, W., and Son, Newport	2,230	0	0
Parfitt, H., Pontnewydd, Mon.	2,150	0	0

* Accepted.

BRAINTREE.—For building a new police station at Baintree, for the Essex county council:—

Coxhead, F. J., Leytonstone	£4,497	0	0
Hunt, J. A., Hoddesdon	4,498	0	0
Phillips, C. N., Cheapside	4,459	0	0
Sharp, J., and Son, Amphyll	4,400	0	0
Johnson, F., Chelmsford	4,243	0	0
Everett, H., and Son, Colchester	4,247	0	0
Kimberley, J. S., Banbury	4,246	0	0
Gozzett, J., Maldon	4,198	0	0
Glassecock, J. L., Bishop Stortford	4,100	0	0
West, E., Chelmsford	4,087	0	0
Parmenter, J., Bocking	4,085	0	0
Brown, A., Baintree (accepted)	3,975	0	0

(County surveyor's estimate, £3,700.)

BROOKLEY.—For construction of a portion of a large sewer at Brookley. Mr. Henry S. Legg, Engineer:—

Perry and Co.	£316	0	0
Killingback	810	0	0
Patman and Co.	795	0	0
Nowell and Robson	768	0	0
Mowlem and Burt	721	0	0

PITFALLS OF PRACTICE.

THE intrusive spirit of modern utility often mars the dream of the artist. The commonplace requirement is always intruding into the sanctum of the architect; the exigent public are constantly asking for something which he has not taken into his confidence. One client regards the completeness of his conservatory or billiard-room above all else in his mansion; another throws blame on his architect if his chimney smokes, or his bath-room apparatus is not in perfect order; and there are others who, oblivious of all merits of design, reproach their professional guide if anything goes wrong with the sanitary requirements. In whatever direction our profession takes us, the commonplace is extensively present in demands of a more or less trivial kind, and the architect, after a few years' practice, is often reluctantly forced to admit that he has spent more time in the higher work of his profession than is convenient or profitable. In spite of all our art schools and teaching, the ordinary public appear to bring everything to the test of usefulness when their actual requirements are at stake, though they strangely affect to admire art crazes, and adopt the most ludicrous forms of furniture and articles of use in their houses. They will complacently submit to be led by the furniture dealer, but deny to the architect any interference with their particular hobby. We have seen chairs, and tables, and so-called "art furniture," which would shock any first-grade student of an art class by their eccentricities, purchased by people who would never dream of submitting to the architect in their fireplaces or bath-rooms. The perversity of some people in their opinions on these matters is extraordinary. They will "strain at a gnat and swallow a camel,"—buy any piece of ready-made furniture, however ridiculous, but decline to allow their architect to design a dining-room mantelpiece.

But where art and utility strangely come into conflict is in the building, of which every retired tradesman thinks he knows a good deal. A few illustrations will suffice, and some of them are actual recitals. The bugbear of a compact house is one of the commonest the architect meets with. Mr. Brown wants to build a house "without a lot of corner twists and turns." The rule he lays down is that it must be square, like his friend Mr. Malaprop's, without any gables, that his windows must face in a given direction. Of course the problem is enough to dishearten the most courageous disciple of the theory that architecture is the simple expression of utility, or that anything, no matter how prosaic, can be made artistic. Unluckily, few have the courage of this conviction, and when they set to work on the design find that, after all, it is a very hard thing to make a square building agreeable. Mr. Brown's architect is probably too shrewd to endeavour to thwart his client's weakness. He may probably argue with him about the desirability of disposing the fronts of the house in so rigid and primitive a manner, but all the talk in the world about the value of making this part prominent, and of retiring that, of making projection here and recess there accentuate the requirements of the plan, or of grouping and light and shade would have little effect on a man who had grown up with the opinion that a square house is the most economical and compact form in which to build. The

"box" type has a strong claim on the commonplace mind, because it expresses the most simple view of the fitness of a building, and is one that is most readily apprehended by the uneducated mind. It is true there are many noble buildings of this type. We cannot find fault with the Farnese or the Pesaro Palace because it represents a cubical form. Why? Because their dimensions and their fenestral divisions, or superimposed orders, divide the mass into parts. Most of the club houses in Pall Mall, like the Reform and the Travellers', are of this shape—their scale takes them out of the ridiculous; but when we see a spick and span box-like new house somewhere in the suburbs, or in a country road, with centre entrance and side windows, we at once regard it with mingled feelings of disrespect and amusement, and can only compare the great example with the small as we look upon the two dogs in that famous picture by Landseer of "Dignity and Impudence."

Almost equally repugnant to the architectural sense is the flat roof. Mr. Handyman makes one condition to his architect, and that is that the roof must be flat. It is so convenient to be able to walk on the flats, or to take up a few friends occasionally to indulge in a chat, or smoke, especially in the summer evening, when the rays of the sun are not too strong. With an even more sordid mind Mr. Gradgrind thinks a roof should be turned to useful account, and may be made a convenient airing ground for drying linen. Again, economy is urged in construction. The very excellent iron joists and concrete construction, covered with a layer of asphalt such as that of the Claridge Asphalt Company, makes a strong and impervious floor for walking upon. The only objection is that there is no visible roof. The Mansard, the pavilion and the gable are forms which give grace and picturesqueness to buildings, they aid in breaking up the roof or skyline; but the straight level top is always hard and unsightly, as we see it in many lately built blocks of "flats." A deep, projecting cornice, as in the Italian palaces, or a balustrade with terminals is the only way of finishing the walls of a large flat-roofed building, but even then, without some irregularity in the plan, this sort of crowning is wearisome and monotonous. Much less endurable is a small building so treated. We can sympathise with the architect under the trying ordeal of having to consult the Gradgrinds in his design for a "Queen Anne" villa. That style has certainly been found flexible enough to allow of a flat surrounded by a balustrade or railing, as well as a tile roof of steep pitch. So far it is accommodating to the most ordinary taste, if that taste is not carried too far as a "fad." A man with a hobby is also exacting and very aggravating to the compliant designer, as the said hobby must be pronounced at the expense of the building. Thus, Mr. Hortus is an amateur floriculturist, and is intent on making the conservatory a decided feature in his new house, and, to make things more awkward, has a notion of his own which cannot by any coaxing be made to adapt itself to the architecture. It is to be a lean-to against the front of the residence. No one knows the mental anguish to the architect in arranging such a structure of glass and iron so that it should be at any rate unobjectionable artistically, and also to comply with the owner's ideas as to slope, method of ventilation, and the construction of the sashes and lights.

The exactions of materfamilias are equally repressive to the artistic mind. What with baths and hot water, nurseries and domestic fittings, the internal arrangements maintain a constant *hors de combat* with the architect's intentions. In town buildings and public edifices, the demands of utility are con-

tinually enforcing themselves upon the designer. The shop front, with its irredeemable ugliness and plate glass, requires all the art and invention of the most resourceful mind. The large, unobstructed shop, with iron columns supporting upper walls, girders, and staircases, take away every means of architectural effect, leaving the decorator and art metal-worker full masters of the situation. The fittings are bizarre, the brass chandeliers and stained glass vulgar and obtrusive. Again, the huge party-wall overtopping the adjoining houses, or the ugly ramping of the back premises to allow light to ancient windows, and lofty chimney stacks are most intractable features which are to be specially dealt with. How best to mitigate and soften these incongruous features, and make them at least less repulsive to the eye, is a task which, we believe, ought to rank higher than that of designing an elevation or a piece of ornament. Just as a general who by successful tactics can divide the mass of the enemy's forces or cut off a position from the base of his operations is greater than he who throws his whole force into the breach with great slaughter, so an architect who can manipulate the ponderable mass of material by skilful adaptation or inventive methods displays his artistic power far more than one who can cover sheets of drawing-paper with designs at a cost of so much per foot of surface. Inventive architecture, or how to overcome difficulties and conquer ugliness, it cannot be too forcibly impressed, is a far greater achievement than any elaborate designing of plain, uneventful building. Can we make architects think so? The very obstacles which their clients place in their way can be surmounted if they tackle boldly the problems of utilitarian every-day building, if they heartily enter into the requirements of practical people instead of completing the design to suit their own tastes, and according to existing standards and precedents. Design to please, instead of design to overcome, has been the formula too generally adopted by the architect. When he can make a flat roof or a factory chimney presentable, and convert a huge square galleried structure from obtrusive hideousness into one that is at least tolerable to the sight, he can say that he has done something to deserve the title he has chosen.

BY-LAWS AND "JERRY" BUILDERS.

THE general effect of building by-laws in our large towns has been to lessen considerably the growth of that mushroom, "jerry building." We have all along foreseen the consequences of local authorities making by-laws to protect the ignorant tenant. Once put into operation a code of building regulations to compel builders to put in good and dry foundations, to use concrete over the areas, to build proper walls, and to provide areas in front and in rear of every dwelling house, and it could easily have been predicted that jerry building would die a natural death. This has, in fact, taken place in many towns we know; the "jerry builder" is far less a personage than he used to be, for he has found out that if the poor ignorant tenant does not know a good and sanitary building from a bad and unhealthy one, there are authorities under whom he lives that will protect him from the clutches of those who put up fever traps under the guise of genteel houses bedizened with the allurements of tessellated paving, stained-glass panels, and pretty fireplaces. Though these superficial attractions are still potent in the minds of many people, their value has been much discounted of late. The builder of "rows" of suburban houses has found out that he can ill afford to concrete the foundations and build substantial walls at the same time as to supply tessellated

tiling for the lobby and hall and leaded glass to the door panels, and that these little embellishments must either be omitted altogether or be of a very inferior quality, if he has to pay the ground-rent and mortgagee. We fancy somehow that rather than forego these decorations, something else will be devised in the shape of a set-off, for we believe there are still many people who would rather suffer a bad drain or inferior closet apparatus than be deprived of the coloured tiles and gilded lead lights on their house front. For all that, the jerry builder will find it much harder than he has done to satisfy the tenant, as well as the town authorities; for if the tenant looks after his ornament, the local authority will take good care that the building is at least sound and safe.

In a recent discussion at the Manchester City Council the question turned on the operation of certain building by-laws, and a letter in the *Manchester City News* shows at least that the by-laws of that city have had considerable influence in checking the jerry builder. In the case of Manchester, as in many other large cities, it is not quality of building so much as the question of open space in the rear of dwelling houses, that has scotched the building octopus. There is a valuable clause, by-law 49, which declares that every person who shall erect a new dwelling house shall provide in the rear thereof "an open space exclusively belonging to such house, and of an aggregate extent of not less than one hundred and fifty square feet, and free from any erection thereon above the level of the ground." This space is to extend laterally throughout the entire width of house, and the distance across such open space is not to be less anywhere than 10ft., which means that if there should be a projecting building or offices, the end of such offices should not be less than 10ft. from the fence or wall of the premises in the rear. The by-law goes on to enlarge this distance with the height of the house, so that if the dwelling house be 15ft. in height, the distance shall be 15ft., if the height be 25ft. the distance to be at least 20ft.; if the height be 35ft., or exceed that height, the distance to be 25ft. The effect of which rule is that the lowest tenement of two stories would have to allow a distance across the back area of 15ft. at least, whereas for ordinary two-story houses of 25ft. high the distance must be 20ft. This distance is small enough, as it only allows 40ft. between the back walls of houses of a superior class. The by-law also requires that no addition or alteration made to the house is to diminish the extent of open space, and that the height is to be measured from the "level of ground over which such open space shall extend to the level of half the vertical height of the roof, or to the top of parapet, whichever may be the higher."

"These by-laws," says the writer of the letter, "have killed jerry building in Manchester, and the above-quoted has, more than any other, been the cause of its death. Birdcage builders on the city council admit that had they foreseen its sweeping effects they would never have consented to its being passed." He goes on to say that one effect of such drastic by-laws will be to call attention to the price of land, that makes the building of good houses at a fair rent an impossibility, and the building of barrack-like dwellings a necessity.

We have here one of the chief causes which have served to restrain jerrybuilding in large towns. The effect of the by-law as to open space will be, it is argued, to limit the number of small houses of the class we have described, and to encourage the building of blocks of dwellings or flats. We doubt very much this inference. Results have shown that the well-to-do working-man or city clerk with small means prefers to take a two-storied dwelling

with a sufficient area of ground in the rear, than to rent a flat. In London we have ample proof of this preference. The many-storied blocks of dwellings are tenanted by single men or those with small families; the six or seven-roomed dwellings in our suburbs, such as those at Plaistow, Leytonstone, Loughborough Junction, are occupied by thousands who can just manage to pay out of their incomes the cost of a moderate railway journey. As a matter of fact, it will be found that the latter class of dwellings pay the best. The idea of an immediate return for capital invested has been the mistaken policy of those who look at the problem of providing house accommodation for the masses on a purely price-of-land basis. To argue that the building of good houses at a fair rent is an impossibility in some towns is one of the plausible excuses made by landowners and speculative builders, who create themselves fictitious ground rents. Thus a capitalist middleman lays out an estate; he forms the roads and sewers, and recoups himself for his expenditure by making out agreements with builders for the erection of rows of houses. The leases are granted from the middleman at a much higher rent than he himself has paid to the landowner. The result is that the builders actually pay double the rent to the middleman that he pays to the landowner. We know, for instance, of several cases where a landowner grants a lease to a capitalist at a small rent. Roads are laid out, and the estate is let off in small plots at a rent which is more than double, often treble, that for which he has taken it. When the houses are built, he can take up leases at, say, £5 per house and grant leases on the same houses to the builders at £12 per house. Who can wonder that the price of land under such circumstances is too great to allow of a well-built house to be let at a fair rental? Again, as pointed out by the writer of the letter we have named, land is purposely kept out of the market to secure a rise in price, and this rise is occasioned by nothing the owner has done, but by improvements made by the municipal authorities, a strong reason for rating vacant land on the increased value created by the improvements made in the borough. Corporations themselves ought to be able to secure vacant plots for building dwellings in the vicinity of any important works, and a fair standard value could then be secured. The horror of the proposed barracks in Manchester is the result of private speculation in building, by which double the fair rent is charged for a certain area of land; but these monopolists of land, aided by the jerry builder, find it convenient to lay the blame not on covetousness, but on the by-laws, which only insist on sanitary dwellings being erected, and a curtilage of land granted that will secure health and convenience.

THEATRES.—III.

By ERNEST A. E. WOODROW, A.R.I.B.A.

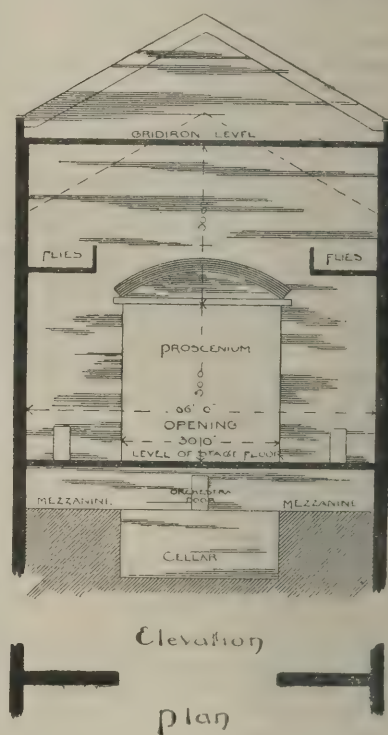

HAVING now fully considered the question of a site for a theatre so far as the surroundings are concerned, it is desirable to see what advantages, if any, can be obtained from a sloping as opposed to a level plot of ground. The benefits to be gained in facilitating the means of exit by building on a sloping site are fully illustrated by the manner in which the Savoy Theatre, London, is planned. Here every peculiarity and irregularity of the formation of the ground is called into account to assist the speedy egress of the public. As most of my readers are aware, the ground slopes from the Strand towards the Embankment. The dress circle is placed on the entrance level from the Embankment; the upper circle exit is level with the side street to the east, known as Beaufort-buildings, and the gallery staircase is very short, and delivers into the street to the west of the building. The dressing-rooms, which are on the level of the street and in the rear of the stage, have their separate exit to the north; the

stage is sunk below the ground level. The advantages thus obtained by the natural formation of the ground diminish the length of the exits from all parts of the house which cannot be gained unless under such exceptional circumstances as these. Where a level piece of ground is the only available plot in a town for a theatre, it must not be despised, because the difficulties can be, and have been, overcome by sinking part of the theatre below the ground. The object of such arrangement is, of course, to equalise the length of the exits from all parts of the theatre, whether from the auditorium or the stage, and—even at the risk of repetition—let me again impress upon the architect who would build a theatre, that the safety, comfort, and welfare of the actors are as much to be desired as the safety, comfort, and welfare of the public. If it were not for actors, and the art of acting, there would be no theatres. Why, then, has their safety been so neglected? We shall, later on, dwell fully upon the necessary requirements of that part of the theatre appertaining to the performers; but for the moment, in choosing the site, do not forget that the "back" of the theatre has to be considered as well as the "front" of the house.

Modern requirements demand smaller theatres

Proscenium Wall

looking towards Auditorium

than in years gone by. Every actor, or actress, who has made his or her mark, is seized with a desire to build a theatre and become "sole lessee and manager." Hence there has arisen a demand for a smaller playhouse accompanied by less financial risk than the large opera houses and patent theatres of the past. As in these smaller theatres it is easier to obtain ready means of egress for the lesser number of people accommodated, so also it is easier to construct them in a manner to permit every division of the audience to be placed as near the street level as possible. In order to accomplish this we find the modern theatres of the west end of London with the pit sunk below the level of the street, and deep excavations made for the formation of the stage and its appurtenances.

There is another great advantage in diminishing the height of the building: it lessens the risk from the consequences of fire, and affords greater facilities to the firemen in executing their work of rescue. A theatre, to be a safe building, must be a theatre pure and simple, and not part of any other building. I may even go so far as to say, considering isolation a necessity, not part of any block of buildings. The great fire

authority of this country, speaking on this subject, says that "shops round theatres and forming part of the same block of buildings are always more or less objectionable, and even under the most favourable circumstances should on no account be permitted, unless the contents are safe from explosion, and the walls, ceilings, and roofs able to resist any fire which could happen in them. This can be done without the smallest difficulty, and consequently there can be no excuse for omitting to do it A theatre would be most safe if standing alone: every house in its vicinity adds to its danger; its risk is greatest when it is entirely surrounded with houses."

I have pointed out elsewhere the folly of spoiling a good theatre site by erecting shops, cafés, or restaurants as part of the scheme. The very spaces required for exits are swallowed up in shops in order that a rental of a few pounds a year may be paid into the manager's pocket. For the sake of this sum the public are endangered to a certain degree, for if the exits are not curtailed in number, the passages are made longer and more tortuous, and deliver, perhaps, into some narrow side street. If shops are included as part of a theatre scheme, they are sure to be given the very best position on the site for the sake of the rent, and the entrance to the theatre is cramped in consequence. Now, as we have seen, the majority of the people frequenting a theatre will use the entrance as the means of egress; therefore the public are endangered by the presence of shops, cafés, &c., &c., quite apart from the actual fire risks.

Theatres should not be constructed either over or under other premises, for reasons which are clearly obvious—i.e., the addition of fire risk, and the diminution of exit space. In London this is forbidden by the sixth rule of the London County Council:—

"(6) No theatre shall be constructed underneath, or on the top of, any part of any other building."

The problem before the architect is to limit the height of the building, so as to bring the topmost gallery seat as near the pavement level as possible, and at the same time not to bury the stalls in the bowels of the earth. An important part of this problem is, while limiting the height, not to limit the number of seats, so that the house cannot hold sufficient "money" to pay as a commercial undertaking.

The best way, as far as I know, to overcome these difficulties is to adopt the system above referred to of partly sinking the theatre below the ground. Mr. Buckle, in the book he has written upon theatre construction, illustrates and describes his ideas of a theatre erected within what he terms an excavation or moat. The problem Mr. Buckle set himself was that the gallery, and not the pit, should be entered on the street level. The writer says that the theatre nearest approaching this desirable consummation is the much-abused Criterion Theatre, London; but he qualifies his praise of this structure by stating that the arrangement of the superstructure over the theatre deprives the auditorium of light and air, which is altogether unsatisfactory. It is well-known that there is not the danger of falling going upstairs, that there is going down, and for that reason a partly-sunk theatre has an advantage over one built high above the ground-line; but Mr. Buckle's scheme is for a theatre on an isolated site without a single public staircase, inclines only being used; there is an open area or space of 25ft. wide from the external walls of the building to the boundary-wall of the site. By this arrangement it is claimed that every part of the theatre may be lighted by windows, perfect ventilation be secured, and absolute control in the event of fire. The gallery, being on the street level, is entered by bridges spanning the moat; other parts of the house are approached by inclined roadways down the moat to the various levels; all these roadways are 10ft. wide. With the internal arrangements of this plan we have at present nothing to do; but it appears at a glance that the site required to hold Mr. Buckle's theatre would be a most expensive one, as, in addition to the area actually covered by the theatre proper, a "moat" of 25ft. wide all round the building is required to be added to the area of the site. The building itself would be 190ft. long by 70ft. wide, the saloons 25ft. wide, and the corridors 10ft. wide, the auditorium 75ft. by 70ft., the stage 70ft. by 40ft., the workshop and dressing-room blocks each 70ft. by 25ft.

Before concluding my remarks upon the height

of the building I must make some reference to the legislation on this point. We find the London County Council has thought some restriction necessary, for in their new rules, No. 7 reads that—"No such premises shall have more than three tiers or horizontal divisions, including the gallery, above the level of the pit. Where the front seats of the gallery are separated from the gallery by a partition, such seats shall not count as a separate tier."

In St. Petersburg theatres must not contain more than four tiers of boxes and galleries besides the pit; and in Italy tiers of boxes shall not exceed three in number, exclusive of the gallery. The pit also shall be on a level with the street, or not more than 6ft. 6in. above it.

In New York there is a special provision prohibiting the introduction within the structure of any hotel, boarding house, lodging house, factory, workshop, manufactory or store, with the exception of such as are strictly required for the theatre use.

No. 8 and No. 9 of the London County Council's regulations also appertain to this subject, and I give them *in extenso*. No. 8 has principally to do with the comfort of the audience in giving sufficient head-room and air-space over the pit and gallery, and No. 9 restricts theatres being erected above other premises, or being buried in the bowels of the earth. This rule would prohibit Mr. Buckle's scheme being carried out in London.

"(8) Where the first tier or balcony extends over the pit, stalls, or area, the height between the floor of the pit and the first tier shall not be at any part less than 10ft., and the height between the floor of the highest part of the gallery and the lowest part of the ceiling over the same shall not be less than 12ft.

"(9) In all such premises the floor of the highest part of the pit, or of the stalls where there is no pit, shall not be more than 6in. above the level of the street adjoining the principal entrance to the pit, and the lowest part of the floor of the pit or stalls shall not be more than 15ft. below such level."

The difficulties of drainage must not be lost sight of when placing part of a theatre below the street. In many instances where this has been done, pumps have had to be called into requisition to keep the cellar of the stage dry, as once below the main-drainage level, the water accumulates in the lowest part of the building. This pumping is a constant expense to the management, with which it should not be burdened. The cellars must be kept dry whether the house is open to the public and earning money, or closed, and money going out without any return. Frequently the engines have to be run daily for this purpose alone. It may, however, be presumed that a cellar below the drain could be so constructed as to insure the exclusion and prevent the percolation of the surface water.

In the present days of advance and demands for modern improvement and luxury, the manager may be certain that if he builds with the times, he is sure to obtain compensation for his additional outlay, by judicious advertisement of the many virtues his house possesses. Crowds flocked nightly to the Savoy when first opened, not only to see "Patience," but to visit the first theatre in London entirely lighted by the electric light. In the same way, managers introducing latest improvements into the construction of the theatre are sure to meet with an equal reward of public patronage.

There appears to be one other consideration which I should notice with regard to the site question. We have seen the advantages to be gained by isolation in reducing the fire risk and increasing the exit accommodation; but we have not yet considered the great assistance that must be afforded to light and ventilation in having a site upon all sides of which windows can be obtained; but ventilation which is only obtained from some inclosed area or small court or alley is no ventilation at all, for the air is frequently most impure, especially when drawn from a slum or back court. Windows are most valuable in a theatre, and for many reasons over and above the important one of ventilation; where a theatre is well flooded by daylight there is not the risk of the accumulation of dirt and rubbish in the house that there is in a dark and unlit building. There is the saving, too, of the use in the daytime of artificial light, the saving of expense, and of the risk which accompanies the cleaner's oil lamp. How is it possible for the cleaners to thoroughly cleanse such a building as a theatre by the

dim flicker of a smoking oil lamp? The sweeping, dusting, and scrubbing must be superficial indeed, and the rubbish that is swept up and hidden away in corners becomes the source of great danger from fire. In a paper which I wrote upon the prevention and extinction of fire in theatres, and which was by the request of the Council of the Society of Arts printed in the *Journal* of that society, I drew attention to this point as follows:—"Daylight and cleanliness are essential for the prevention of fire. Where ample daylight is admitted, there is every chance of the theatre being swept and kept clean in every corner; collections of rubbish, dirt, and dust, in out of the way nooks and corners, are always a source of danger. Dry dust, paper, shavings, oil-rags, and such like inflammable refuse, ready to ignite by spark or spontaneous combustion, are often found swept away out of sight by the cleaners. Such carelessness and thoughtlessness are too often the cause of fire. The use of matches, the burning ends of cigars or cigarettes, recklessly thrown among those dangerous little heaps of rubbish, is sufficient to start a fire which may end in dreadful results and loss of life."

In the Austrian regulations there is a clause which impresses upon the manager that "cleanliness generally in all parts of the house is to be a special duty."

In Austria such importance is placed upon the desirability of having plenty of window space that a special rule is framed, that "all parts of the house must be well and sufficiently lighted by windows."

Where light is obtained by skylights, there is always a danger during a fire of falling materials breaking the glass and conveying the fire to other portions of the premises; or where a fire occurs in premises overlooking the theatre, there is the risk of the fire spreading to the theatre through the skylight. To provide against this, Rule No. 23 of the London County Council appears to have been called into existence. It reads thus:—

"All skylights, and the sloping sides of lantern lights, shall be protected by galvanised-iron wire guards, securely fixed on the outside of such skylights or lantern lights."

Windows have yet another valuable office to perform in theatres, as they provide ready means of escape in cases of fire, especially where outside balconies are provided. Where there are windows at every level the fireman can make use of the fire escape as a means of rescue for those within the building. Every window should have an outside balcony—in fact, one may go so far as to say that every tier or floor, whether of dressing-rooms or of the auditorium or offices, should have continuous balconies with stairs leading down to the balcony below. In New York this is compulsory: "There shall be open balconies not less than 4ft. in width at each level or tier above the parquet, on each side of the auditorium, of sufficient length to embrace two exits, and from said balconies there shall be staircases extending to the ground level, with a rise of not over 8 $\frac{1}{2}$ in. to a step, and not less than 9in. tread exclusive of the nosing; the staircase from the upper balcony to the next below shall not be less than 30in. in the clear, and from the first balcony to the ground 3ft. in width in the clear, where the seating capacity of the auditorium is for one thousand people or less; 3ft. and 6in. in the clear where above one thousand, and not more than eighteen hundred people; and 4ft. in the clear where above eighteen hundred people and not more than twenty-five hundred people; and not over 4ft. 6in. in the clear where above twenty-five hundred people. All these balconies and staircases shall be constructed of iron throughout, including the floors, and of ample strength to sustain the load to be carried by them, and they shall be covered with a metal hood or awning to be constructed as shall be directed by the superintendent of buildings."

It would be well if similar provision were compulsory in England, as in New York and some Continental cities. Mr. James Springer's new Municipal Theatre for Amsterdam is provided in every tier with such balconies. Mr. Phipps has also adopted them at the Shaftesbury Theatre, which, I believe, is the only example we have in London of this provision for public safety.

In Paris, if the theatre is separated from adjacent premises, or if it has internal areas suitable for escape in case of fire, the side fronts and those abutting on these areas must be

furnished with fixed iron ladders in a straight line with the windows, or with special openings made for the purpose.

Iron bars or grilles before windows are most objectionable, as they prevent them being used as means of escape. French windows opening outwards and fastened only by automatic bolts would be a good form of window from the parts occupied by the audience.

Another feature must be noted before leaving the outside of the theatre to consider the internal arrangements. The differences of levels of the various roofs should be approached by iron ladders for the use of the firemen, and permanent cat-ladders should be placed so that the whole of the roofs can be traversed with ease.

SHADOWS IN PERSPECTIVE.—IV.

By ARTHUR VYE PARMINTER.

WE have studied the system of shadows thrown by rays of light parallel to the picture plane—firstly, front planes and right angles; secondly, oblique planes and vertical lines; and thirdly, what we are going to treat of in this article: oblique planes and oblique lines. Before considering the Fig. 7, we will take the examples of the constant rule for shadows in Figs. 8 and 9. These two figures will enable the student to thoroughly understand the construction of all the shadows in the general view, Fig. 7. We have to find the shadow thrown by the projecting portion of the wall B A D—that is to say, the traces of the shadow of lines B A, A D. Now we know that to find the shadow of a point, we must pass through this point, and the projection of this point on the ground plane—a plane parallel to, and therefore containing, the rays of light, and also contained in this plane and through the point a line in the direction of the rays. For instance, through the point A and its projection D on the ground, or the line A D, we pass the plane A a D containing the rays of light R L I, R L. The shadows of the point A will therefore be at a, the point of meeting of the line R L I, and the horizontal line R L. But we notice that this plane intersects the wall at c a 1, or the vertical raised from c when the horizontal meets the wall. The shadow, therefore, is stopped at c a 1, and a 1 is the shadow of point A on the wall. The line forming a 1 and B will also be the shadow of the line A B. The shadow

is thus contained by the lines A B, B a 1, a c 1, c D.

Again, in Fig. 9 the pole A D, leaning against the wall at the point A, throws a shadow against the wall. To find the shadow of the line A D, it will suffice to find the shadow of point A, by means of the plane containing the rays of light passing through this point and its projection C on the ground. We find the shadow of A will be at a on the ground plane; the line forming a and D would be the shadow of A D. But the shadow plane is intersected by the wall at A and C, and we find that the line a D, the shadow of A D on the ground, is stopped by the wall at a 1;

ground and partly against the wall. From the ground point b of the angle A b we draw a horizontal line meeting the wall of the building at b (this line is the line R L of Figs. 8 and 9 in the plane of the rays of light), and from point A, the line A a in the direction of the rays of light, and corresponding to R L I in Figs. 8 and 9). From point b, where the horizontal ground line meets the wall, we raise a vertical, meeting A a at a; if, now, we join a and B, we complete the lines of the shadow of B A, A b.

Let us now take the ladder leaning against the wall. We will find the shadow thrown by the

a 1 D will therefore be the portion of the shadow on the ground, the remaining portion falling on the wall from a 1 to A, the substitute to a 1 a on the ground. The shadow of A D is thus, A a 1 D.

In Fig. 7, which we have made as simple as possible, we have the oblique planes of the building and wall, and the oblique lines of objects which cast their shadows on the oblique planes. These objects are composed of lines at different angles and positions, as regards the wall and ground planes. For each of the objects we must proceed as in Figs. 8 and 9. The rays of light still arrive parallel to the picture plane, and at any given angle to the picture plane.

Let us first find the shadow thrown by the projecting wall B A, which will be partly on the

line O O. We must produce O O to K against the wall, and from K drop the vertical K k; k is therefore the projection of K on the ground plane. From point k we draw a horizontal line k k 3 (R L, Figs. 8 and 9), and from K a line in the direction of the rays of light (R L I, Figs. 8 and 9) meeting k k 3 at k. From point k 3 we draw a line to ground point O, and meeting the wall at S; if, now, we join S K we shall have the shadow line of O O at O S, S K. The shadow of point O will be found by drawing a line in the direction of the rays, and meeting the line S K at O the shadow of O. The shadows of the remaining lines are found in a similar manner, and are sensibly parallel to O S, S O. The shadow of the rungs of the ladder are similarly obtained by

means of lines from each rung to the shadow lines.

The shadow of the window-sill MN may be left for the student to work out himself.

The swing support is somewhat similar. From D the trace of the line CD, we draw the horizontal line Dd, meeting the wall at d on the line Cd from the vanishing point, and from d we drop the vertical line dd, meeting the line Dd (in the direction R L I) at d. Point d will, therefore, be the shadow of D, and d c joined the shadow of D C. The horizontal Dd (representing R L, Figs. 8 and 9) is, in this case, more conveniently drawn in the air from point D than from the projection of D on the ground, and is evidently similar to that which would be drawn on the ground plane.

For the upright support F V V, we draw from V V the horizontal lines V V, V V, meeting the wall at V V, and from these points we raise verticals. The shadow line from F meeting the vertical line from V at f, determines the shadow f V V of the line F V. The shadow e of point E is found by means of similar lines from the projection of E on the ground. We may again notice that in this case, also, the shadow on the ground is interrupted by the wall, and, therefore, continues vertically on the wall plane.

The shadow of the trapeze may be constructed by the student by means of the same rules, and the trace W of the bar on the wall.

That of the inclined clothes-pole is similar to the shadow thrown by the ladder; but in this case the shadow continues uninterruptedly along the ground. We find the projection of z on the ground at y by means of the vertical from Z and the line X y to the vanishing point. By means of the plane passed through Z y—that is, the horizontal line z x and the line Z x in the direction of light—we find the point x the shadow of Z. The line forming x X is thus the shadow of Z X.

The shadow of the inclined end of the box is obtained by means of horizontal lines from the points O C, and the lines of light 55 and 66; also the line from 5 to the vanishing point. The cover of the box leaning against the corner O is similarly constructed. A horizontal line from 4 meets the side of the box at 4; from this point we raise a vertical line, meeting the light line from 3 at 2, the shadow of point 3. Through point O, where the cover touches the angle of the box, we draw a line parallel to 34, and from point O a horizontal O2 meeting the line of light from 2 at 2. Through the point 2 obtained we draw a line to the vanishing point of the cover (a point different to that of the general perspective), 12a, and join a3. The shadow is thus contained by the lines 12a, a34, 44.

The shadow of the dove-cot should now represent no difficulties to the student. The eaves of the roof throw its shadows as far as g g. The shadows of the soffit and side of the window cover the window entirely, as may be seen by tracing the constructional lines. In all of these cases we now understand that the system of construction does not vary; in every case it consists in passing a plane containing the rays of light vertically and horizontally through the line or point throwing the shadow, and taking into account the intersection of this plane with other planes it may meet.

PRICES.*—XLII.

(All Prices Include Profit, and have had all Trade Discounts taken off.)

IRONMONGER (continued).

HOBBS' LOCKS

For rebated locks add to the prices already given 1s. 6d. for 3in. to 4in., for 4in. rebated and for 5in. to 6in. 2s. each, and for 7in. to 10in. 2s. 6d. each, and 1s. for 11in. in extra thickness of lock beyond 7in.

For full rebated locks add to the prices given 5s. for 3in. and 5s. 6d. for 4in., and 6s. 6d. for 5in. to 6in.

MORTISE LOCKS, with double clutch bolt fixed— £ s. d.
No. 580 3 by 3in., with 2 keys each 0 19 0
582 4 by ditto ditto 0 22 0
586 6 by ditto ditto 0 23 0
588 6 by ditto ditto 0 27 0

Ditto, single clutch, fixed—

No. 604 3 by 3in., with 2 keys ditto 0 14 0
606 4 by ditto ditto 0 13 6
607 6 by ditto ditto 0 13 0

No. 582 and 607 if made with moulded or beaded H plates to order, 6s. to 12s. extra each.

FLUSH NIGHT LATCHES, 1-sided, extra strong, fixed—
No. 20 2 4in. 4 lever, 2 keys each 0 8 6
20 4 ditto 3 keys ditto 0 10 0
120 2 4 6 lever, 2 keys ditto 0 11 6
18 3 4 lever, 2 keys ditto 0 12 0
18 3 ditto 3 keys ditto 0 13 6
20 2 4 keys ditto 0 11 6
20 2 6 keys ditto 0 14 6

POLISHED BRASS PLATES, flush latch, fixed—
No. 16 3 4in. 5 lever, 3 keys ditto 0 15 0
Extra keys 1s. 6d. each, and if made to order 2s. each.

PATENT FLUSH NIGHT LATCH, fixed—
No. 2 2 4in., 3 keys, to open with the key only from the outside, knob on the inside to draw back bolt each 1 2 0
No. 4 2 4in. ditto, but with the knob to turn on the inside and not to draw back ditto 1 4 0

RIM NIGHT LATCHES, 1-sided, extra strong, 3 keys; 2 keys 1s. less, fixed—
No. 10 F 4in. 4 lever, 2 keys each 0 8 6
10 F 4 ditto 3 keys ditto 0 10 0
11 F 4 6 lever, 2 keys ditto 0 11 6

The above to open with the key only from the outside, bolt to draw back.

No. 10 F, with 4 keys ditto 0 11 6
10 F 6 keys ditto 0 14 6
9 F 3in. 4 lever, 2 keys ditto 0 12 0
9 F 3 ditto 3 keys ditto 0 13 6

Extra keys 1s. 6d. each, made to order 2s.
No. 1 F 4in., 3 keys, best quality ditto 1 0 0
4 F ditto, with the knob to turn on the inside ditto 1 2 0
Keys 2s. each, ditto to order 2s. 6d. each.

FLUSH LOCKING LATCHES 2-sided, to open inside by a knob, and to open and double lock with the key inside or outside, fixed—

No. 21 2 4 by 3in., for doors 2in. thick, strong each 0 11 9
21 2 4 by 3in. ditto, 2 1/2in. thick ditto ditto 1 2 0
27 2 4 by 1 ditto, 2 1/2in. ditto ditto 1 9 0
30 2 4in., and 2 keys ditto 1 9 0
32 2 6 ditto ditto 1 15 0
34 2 6 ditto ditto 1 18 0
36 2 9 ditto ditto 2 8 0

With brass cases, extra 4s. to 8s.

MORTISE DRAW-BACK STREET-DOOR LOCKING LATCHES, follower action, and 2-sided, fixed—

No. 1 H 6 by 3in., 3 lever, for 1 1/2in. doors each
2 H 6 by 4 ditto 1 1/2in. ditto ditto
4 H 7 by 4 ditto 2 1/2in. ditto ditto
6 H 8 by 5 ditto 2 1/2in. ditto ditto
7 H 9 by 5 ditto 3 1/2in. ditto ditto

These locks are complete with knobs and 2 keys.

PATENT MORTISE DITTO, best quality, fixed—

O 1 H 6 by 3in., with 2 keys ditto 1 18 0
O 2 H 7 by ditto ditto 2 2 0
O 3 H 8 by ditto ditto 2 10 0

The above have ebony or brass knobs.

UPRIGHT DRAW-BACK MORTISE LOCKING LATCHES, with follower action and 2-sided, fixed—

No. 8 H 2 by 3in., 3 lever and 2 keys each 0 18 6
9 H 2 1/2 by 3 ditto ditto 0 17 0
10 H 3 by 3 ditto ditto 0 16 0
11 H 4 by 3 ditto ditto 0 16 0
18 H 3 by 4 ditto ditto 0 15 0
19 H 4 by 4 ditto ditto 0 15 0
20 H 4 by 5 ditto ditto 0 17 0

DITTO PATENT, best quality, fixed—

No. O 4 H 2 by 3in., with 2 keys ditto 1 15 0
O 5 H 2 1/2 by ditto ditto 1 15 0
O 6 H 3 by ditto ditto 1 15 0
O 7 H 4 by ditto ditto 1 15 0
O 8 H 4 by ditto ditto 2 0 0

Complete with ebony or brass knob.

Rebated locks 1s. 6d. to 6s. extra each.

Bronze metal bolts 1s. 6d. to 2s. 6d. extra.

MANSION DOOR LOCKS 2-sided, fixed—

No. 30 H 8 1/2 by 3in., 4 lever, extra strong, 2 keys ditto 1 6 0
Ditto, with latch and drawback bolt, fixed—

No. 32 H 8 1/2 by 3in., 5 lever, and bronze metal bolt ditto 1 10 0

All knobs extra.

Best ebony, the set of 3, fixed, 4s. 9d.

Plain brass, ditto, 6s. 9d.

Bronzed octagon, complete, for each lock, 9s. 9d.

Fine finished locks, extra, each 1s.

22c. 8in. rim, with latch and drawback bolt, with knobs complete, and strong ditto 1 7 0

24c. 11in. ditto ditto extra ditto ditto 1 18 0

These rim locks are complete with 3 round brass knobs.

Octagon knobs extra, 6s. to 15s.

Locks mounted with brass ribbon border extra each 0 10 0

MORTISE dead locking latches (2 sided), to open and lock on both sides, with the key only fixed—

No. 21 H 1 1/2 by 3 1/2 lever spring bolt only each 0 14 0
2 H 2 by ditto 2 keys ditto 0 17 6
3 H 2 1/2 by ditto ditto ditto 0 16 6
4 H 3 by ditto ditto ditto 0 12 0
5 H 3 1/2 by ditto ditto ditto 0 13 0
7 H 6 by ditto 4 lever ditto ditto 0 13 0
9 H 4 by ditto ditto ditto 0 14 0

Fine finished extra, 1s. each.

PATENT DITTO, best quality, fixed—

No. O 28 H 2 1/2 by and 2 keys ditto 1 10 0
O 30 H 3 by ditto ditto 1 10 0
O 33 H 3 1/2 by ditto ditto 1 10 0
O 34 H 4 by ditto ditto 1 15 0
O 38 H 4 by ditto ditto 1 18 0
O 39 H 7 by ditto ditto 2 5 0

Bronze metal bolts, 2s. 6d. to 3s. 6d. extra. These latches, used for asylums and reformatories, &c., should have a steel shield plate outside the keyhole, extra 2s.

SPRING BOLT LOCKING LATCHES, fixed, adapted for shop doors, closets, to be opened by the handles on each side of the door, and having spring bolt— £ s. d.

3 by 3in. No. 24 Y light bolt each 0 4 6
3 1/2 by 25 Y ditto ditto 0 4 6
6 by 26 Y broad ditto ditto 0 5 6
6 by 27 Y extra ditto ditto 0 6 6
7 by 28 Y ditto ditto 0 9 0

LEVER LOCKS for park, field, and area iron gates, not fixed—

4 1/2 by 4 by 3/4 light iron gate, dead lock, with bronze metal bolts, No. 35, 2 keys each 0 11 6
5 by 4 1/2 by 36 ditto strong, ditto ditto 0 18 0
6 by 5 by 37 ditto ditto ditto ditto 1 1 0

4 1/2 by 4 by 3/4 draw back, with bronze metal bolt, No. 235, light, with 2 keys each 0 9 0
5 by 4 1/2 by 3/4 ditto strong No. 236, strong ditto 0 14 0
6 by 5 by 3/4 ditto ditto 237, ditto ditto 0 18 0

Field gate-locks, with chains and bronze metal bolts, 15s. to 19s. each, unfixed.

For hunter's gate-paddock, 18s.

Clutch bolt locks for securing sliding gates and doors, 38s. to 55s., with 2 keys, fixed.

4 by 3in. 2-bolt mortise in galvanised case, strong, for area gates, 2 keys, fixed.

Galvanised cases to locks, 1s. each.

Projecting bolts, 1s. 6d. to 3s. each.

WATER-CLOSET LATCHES, fixed—

6in. 2 bolts brass flanged rim, with 2 bolts, No. 151 X each 0 8 6

6in. japanned flange rim, 2 bolts ditto 0 6 0

3 1/2in. flush brass latches, 2 bolts, with sunk slide bolt, No. 55 X ditto 0 4 9

6in. ditto, with brass knobs, No. 56 X ditto 0 11 0

3 1/2in. rim, japanned, No. 57 X, with slide-bolt ditto 0 3 9

4in. mortise, No. 58 X ditto ditto ditto 0 7 6

3 1/2in. flush brass, 2 bolts, with sunk slide-bolt with knob inside, and to open outside with a ward key and 1 key ditto 0 6 2

Extra keys, 9s. per dozen.

VARIOUS LATCHES, to be opened on the outside with a key and inside with a knob, 1 bolt, flange rim, with key and knob inside only, fixed—

6in. 1-bolt brass case, 1 ward key each 0 10 0

Ditto japanned ditto ditto 0 7 6

3 1/2 by 3in. mortise and 1 ward key ditto 0 6 6

6 by 1 1/2 ditto ditto ditto ditto 0 7 0

Extra keys, 12s. per dozen.

SPECIAL BRASS LOCKS for ships, state rooms, pleasure yachts, and marine residences, fixed—

3 by 3in. rim dead lock each 0 11 6

4 by ditto ditto ditto 0 15 6

3 by mortise ditto ditto 0 12 6

4 by ditto ditto ditto 0 16 6

3 by single clutch mortise, 1 key ditto 0 18 9

6 by ditto ditto ditto 1 4 3

6 by 2-bolt mortise ditto ditto 1 1 0

7 by ditto ditto ditto 1 3 0

4in. 2-bolt moulded rim ditto ditto 0 18 0

3 1/2 ditto flanged rim ditto ditto 0 15 0

6 ditto ditto ditto ditto 0 13 9

6 ditto moulded rim ditto ditto 1 1 0

7 ditto ditto ditto ditto 1 4 6

LIFT-UP MORTISE LATCH for front doors, horse-boxes, &c., fixed—

For lift-up handles and for thumb-latches each 0 11 6

Ditto with double bevel bolt ditto 0 12 0

No. 430 a complete, with lock half-raised, egg-shaped handle ditto 1 5 0

PATENT PROTECTOR SAFE LOCKS for securing the bolts of common safes, unfixed—

3 1/2 by 3 1/2 by 9-16 6 lever, No. 470 each 0 14 0

3 1/2 by 3 1/2 by 8 ditto 472 ditto 1 8 0

5 by 5 by 8 ditto 475 ditto 2 15 0

8 by 8 by 1 1/2 8 ditto 490 ditto 6 0 0

COMBINATION BOLTS and Locks and Royal Albert door bolts, unfixed—

Fig. 769. Mortise combination bolt, 2in. to centre of follower, for locks 3 B to 27 B each 2 2 0

Ditto for locks with 2 bolts ditto 2 8 0

Patent protectors ditto 3 12 0

Fig. 766. Albert bolts for mortising with edge of door prepared for swing doors ditto 0 19 0

Ditto for folding doors half rebated ditto 1 2 0

COACHHOUSE and Railway Station door locks and bolts, unfixed. Where the fixing has to be added, the kind of wood must be borne in mind, as there is a good deal of labour in the fixing; the value in deal is 5s. to 7s. each, varying with the kind of bolt—

No. 792. Bolting only top and bottom, the top part bolting both doors each 2 17 0

791. 1 bolt at top and 1 at bottom ditto 2 12 0

Ditto with central bolt and 2 at top, as No. 792, and made to lock ditto 3 12 0

Extra for solid plugs for stone or brass sockets ditto 0 5 0

Extra strong for gates above 8ft. 9s. 6d. to 19s. extra.

777. Strong combination rim lock, patent protectors, three-way action, with very broad strong bolts and sockets complete, with bolts 10in. ditto 7 12 0

NOTES ON THE FACTORY AND WORKSHOP ACT, 1891, 54 & 55 VIC. CAP. 75.*

THIS Act, which came into force on the 1st of January of this year, constitutes an important addition to the duties of municipal engineers and surveyors and of inspectors of nuisances throughout the country. The Act is chiefly an amendment of the Factory and Workshop Act, 1878, which is operative throughout the United Kingdom, and is much larger in its scope for the purpose with which it deals than the Public Health Act, 1875, which does not extend to Scotland or Ireland, nor generally to the Metropolis. The new Act is to be administered partly by the inspectors of factories, and partly by the sanitary authorities, the latter expression including both urban and rural sanitary authorities, and also district boards or vestries in the metropolis having like powers, the only exception to this being section 4 of the Act, which deals with the "cleanliness and white-washing of workshops," where by sub section 4 it is stated that it does not apply to any "workshop" or "workplace" to which the Public Health (London) Act, 1891, applies. Under the Public Health Act, 1875, and the Factory and Workshop Act, 1878, local authorities are now charged with the duty of seeing that workshops generally (including workshops distinct from factories by the Factory Act, 1878, section 93) are kept in a healthy condition as regards cleanliness, ventilation, and overcrowding. Local authorities are also required to insure that every workshop under the Factory Act, 1878, and every "workplace" within the meaning of the Public Health Act, 1875, is kept free from effluvia arising from drains, closets, urinals, or other similar nuisances. Further powers are conferred upon the local authority by the new Act with reference to the necessary lime-whitening of workshops, as well as the right of entry and inspection, and taking legal proceedings. These powers of entry, &c., are additional to those which the local authority

* A paper read at the annual meeting of the Incorporated Association of Municipal and County Engineers & Bury, by H. PEECEY BOULNOIS, M.Inst.C.E., City Engineer of Liverpool.

NOTES ON THE FACTORY AND WORKSHOP ACT, 1891, 54 & 55 VIC. CAP. 75.*

THIS Act, which came into force on the 1st of January of this year, constitutes an important addition to the duties of municipal engineers and surveyors and of inspectors of nuisances throughout the country. The Act is chiefly an amendment of the Factory and Workshop Act, 1873, which is operative throughout the United Kingdom, and is much larger in its scope for the purpose with which it deals than the Public Health Act, 1875, which does not extend to Scotland or

ties possess under the Public Health Act, 1875. Briefly, it may be said that as regards conditions of health, the control of workshops is now handed over from the inspectors of factories to the sanitary authorities. With regard, however, to both factories and workshops, an inspector of factories may prompt the sanitary authority to enforce the ordinary provisions of the law as to public health, and in default of their doing so, he may take proceedings himself, or he may enforce the sanitary provisions without notice to the sanitary authority in cases where he is specially authorised for the time by a Secretary of State. In any of the cases where the proceedings are successful he may recover all expenses from the sanitary authority. These summary powers as to factories and workshops apply also to laundries, which are now brought under the Factory Acts for the first time. The most important feature, however, of the new Act, so far as this Association is concerned, is the requirement as to "means of escape from factories in case of fire," contained in Section 7 of the Act. That section provides in effect that every new factory in which more than forty persons are employed shall have a certificate from the sanitary authority that it is provided with a "reasonable means of escape in case of fire," and that it shall be the duty of the authority to examine every such factory, and to give a certificate when satisfied that the required means of escape have been provided. With regard to the factories existing at the time of the commencement of this Act where more than forty persons are employed, the same section provides that it shall be the duty of the sanitary authority to ascertain whether all such factories are furnished with means of escape, and in the case of any factory not so provided, to serve on the owner a notice specifying what is necessary for that purpose and requiring him to carry out the work in a certain time. The principal points to be considered with reference to this section are:—(1) Who is the "owner"? (2) What is a "factory"? (3) Does the number of forty persons employed relate to the "entire factory," or only to that portion of it which requires "means of escape"? (4) Are the "means of escape" to be special in addition to the ordinary exits? The first point, as to who is the "owner"? is fairly well settled in the section itself. In subsection (2) he is described as the person within the meaning of the Public Health Act, 1875, the owner of the factory. The well-known definition in section 4 of the Public Health Act is sufficiently clear, as it states in effect that the owner is the person who receives, or who would receive, the rack-rent. (2) What is a factory? This can only be answered by reference to the Factory and Workshop Act, 1878, that being the principal Act to which the Factory and Workshop Act, 1891, is supplementary. Section 93 of the former Act contains a definition of "factory," which is long and intricate, and refers to schedule 4 of the Act, which is equally long and intricate. It is hardly possible to abbreviate that definition and to obtain precision in the explanation; but, in general terms, and subject to some extensions and limitations of meaning, a factory is a place where—(a) Mechanical power is used to work machinery in manufactures, or where (b) hand labour is employed in manufactures with mechanical power in aid. (3) Does the number of forty persons employed relate to the entire factory, or only to that portion of it which requires means of escape? On reference to the section it will be seen that the following words are used: "Every factory . . . in which more than forty persons are employed shall be provided on the stories above the ground-floor with . . . means of escape in case of fire for the persons employed therein," &c. It would seem, therefore, to follow, that in the case of a factory where, say, forty-five persons are employed, of which number only five are employed on the stories above the ground-floor, means of escape must be provided for the use of the five. It does not seem that it would be sufficient for the owner to contend that there are not more than forty persons employed above the ground-floor, or that to require provision perhaps of a costly nature for their safety is unreasonable. If more than forty persons are employed in the entire factory, means of escape must be provided for those persons (if any) however few, who are employed above the ground story. On the other hand, it seems clear that there is no power to require means of escape from the ground story,

or from stories below the ground story, although there are cases where such stories are specially liable to fire, and where the means of escape are inadequate, however many persons may be engaged at work in these stories. This appears to be a defect in the framing of the Act, but one which may not have been thought to be of sufficient importance to be dealt with. There is, however, a further defect of some importance which apparently might well have been met by special provision. It is as follows:—I have already pointed out that five or even a less number of persons working in an upper story must be provided with sufficient means of escape in case of fire when more than forty persons are employed in the entire factory, but in cases where twenty, thirty, or even forty (not more than forty) workpeople are altogether employed in upper stories, the factory being situated entirely above the ground-floor, the enactment does not apply. Such cases are not at all rare, especially in towns where the ground stories are occupied for shop purposes, often at high rentals, and the upper stories are used as factories. In every such instance the unfortunate persons in the factory at the top of the building (provided they do not exceed forty persons) receive no protection from the new Act, although in another factory a much lesser number of persons in the upper stories may receive adequate protection. (4) Are the means of escape to be special in addition to the ordinary exits? The section prescribes that the means of escape in case of fire shall be furnished on the stories above the ground-floor. The means of escape also are to be such as can reasonably be required under the circumstances of each case. It may, therefore, be fairly argued that in some cases the ordinary exits already provided from the upper stories would not be quite reasonably sufficient and yet may be capable of improvement so as to be better adapted for the purpose than any additional exit or exits could be made. Thus, a building of several stories in height above the ground having one long front to an open workyard, and practically no other front, may have a fireproof staircase external to the workrooms, placed in the middle of the front. Such a staircase may be the best kind of arrangement possible under the circumstances, and yet it may not be adequate for the egress of a large number of persons in a state of panic. In such a case it might be possible to improve the staircase sufficiently by widening the several doorways in it, or by altering the arrangement of the steps or landings, or by enlarging or inserting windows in it, so as to give the workpeople a better view of the open yard, and better means of escaping by the staircase. In such an instance the means of escape which could be "reasonably required" might not involve the provision of additional exits. Another instance may be that a staircase (even a fireproof staircase) is placed within the building, with its foot in the ground story at some distance from the outer walls. The various stories (including the ground story) may be liable to fire, and the workpeople in the upper stories may run the risk of being suffocated in this staircase, or being burnt in the ground story before they could reach the outer air. In an arrangement of that kind the means of escape which could be "reasonably required" would involve the provision of additional exits. It may, therefore, be concluded that the question, whether the means of escape are to be in addition to the ordinary exits, can only be answered with reference to the "circumstances of each case" taken by itself. Here we arrive at the main point in the administration of the Act as to "What is the best method of providing the required means of escape in the generality of cases?" I do not think we can take this to mean the "ideally" best method, or the best possible method of providing means of escape. The sanitary authority must be satisfied with such means of escape as can "reasonably be required." Now, I do not think it would be unreasonable in most cases to require that the persons employed in the building shall be able to readily escape from the room where fire has broken out into the open air at some level or other. This at least would prevent suffocation, and would allay panic. The best and easiest way of effecting this object would usually be to provide a strong balcony or flat roof (perhaps of concrete) at or near the level of the floor of the particular story in question; the balcony to be continuous throughout the length of the outer

wall on which it is fixed, not a mere balconette in front of each window. If possible, it would be a good arrangement to connect one or both ends of the balcony with a flat roof of a lower building. Egress from the workroom, or balcony, or flat, as the case may be, should be direct, and as easy as possible. It would be better that there should be no necessity to climb up on to a window-sill at a height of 3ft. or 4ft. above the level of the floor of the workroom, but a sufficient doorway should be provided in the usual way. The balcony should have a strong railing, about 4ft. in height. The persons in danger having escaped for the moment from the immediate presence of fire, some means of descent to the ground is necessary. To meet this need several patent arrangements of folding ladders or other apparatus, would be suggested for adoption, but it may be presumed that most responsible officials of sanitary authorities would not be content to allow that such precarious means of escape are reasonably sufficient. In some cases the balcony or flat may be connected with another building in the same occupation where there is no risk of fire, and where sufficient and easy means of egress may be had. But if descent from the balcony or flat can only be had by providing a fixed stair or step-ladder communicating with another balcony or flat at a lower level, it will, in my opinion, be "quite reasonable" to require such a provision, even if the stair has to be fixed on the outer face of a wall abutting on a public street. In that case it would be sufficient to make the stair or step-way wide enough for only one person to pass down at a time, and it may not be necessary to continue it to the level of the ground. The character of the balcony is a matter of some importance. A projection of 2ft. 6in. from the wall would be sufficient, and the width of any stair or step-ladder may be as little as 18in. in the clear. This will allow a space of 1ft. between the railing of the balcony and the rail at the head of the stair when the latter is placed close to the wall as it should be. If possible, the whole of the balconies and ladders should be of wrought iron, not of cast iron, which is treacherous even when first erected, and rapidly deteriorates by rust. As the persons who are affected by the new Act may be inclined to regard it as a somewhat unnecessary interference with their rights, it is as well to approach them in the first place in as considerate a manner as possible. Thus, it is well to issue a preliminary notice informing the owners and occupiers of the fact that a new enactment has come into force, which the local authority is bound to carry out. In connection with the issuing of such a notice I have found no difficulty, and have had many courteous replies thereto. Another good effect of the preliminary notice is that sometimes the occupier will write to say that the number of persons employed is less than forty, and the responsibility thus rests with him, if he has given wrong information. After making a sufficient inspection (which in many instances will require more than one visit), if the surveyor is convinced that sufficient means of escape have not been provided, he will find that the next proper step is to report the facts briefly to the local authority in order that they may instruct either their surveyor or clerk to issue a legal notice to the owners. This will necessarily be a strictly legal notice in which there will be no place for expressions of mere courtesy. It must specify the requirements of the authority for the purpose of carrying out the objects of the section, and will require careful consideration on the part of the surveyor in making his report to the authority, and the literal wording of his report should be followed as far as possible in the wording of the legal notice. The information given must be sufficient to enable the owner to hand it on to an architect or builder, who would thus be able to plan and execute the work. In this notice a date must be specified before which the measures necessary for providing the required means of escape must be carried out. The time should be sufficiently long to allow of the alterations being schemed and effected without undue haste, and during the course of the time specified it will naturally be prudent to inquire whether steps are being taken to comply with the notice, and in case of neglect to warn the owner that proceedings will follow after the term has expired if the neglect is continued. One of the most important practical points in the administration of this part of the Act is the granting of a certificate as to the suffi-

ciency of the means of escape from "factories" erected after the commencement of the Act. It will perhaps be best to make this document as brief and general in its terms as possible. It may be confined to a simple statement that the means of escape are sufficient and reasonable under the circumstances of the case, following closely the words of the Act. There is a somewhat remarkable omission from the section of any requirement of inspecting factories from time to time after the first inspection has been made, to ascertain whether they are provided with the means of escape mentioned in the Act for factories which are commenced to be erected after 1891. For those factories existing at the commencement of the Act provision is made for re-inspection. It is somewhat curious also to note that no certificate is required to be granted in the case of factories existing or begun to be erected before the commencement of the Act. The foregoing remarks as to notices and reports and the methods of improving the means of escape obviously relate to these existing factories. These are buildings that will give most trouble to the surveyor. But although the powers of the Act with regard to them are both comprehensive and strong, there is no obligation to grant a certificate. It is only with respect to new factories (i.e. those begun to be erected after the commencement of the Act) that a certificate is to be granted. The reason for this difference of treatment is not quite apparent, although there may have been good reasons in the minds of the framers of the Act. It would seem to follow that the granting of a certificate for an old factory would be *ultra vires*, and might be productive of more harm than good. Another puzzling anomaly of rather greater importance appears in the strange circumstance that whilst the authority must grant a certificate for every new theatre provided with sufficient means of escape, there does not seem to be any provision for making a renewed inspection of the building, or granting a renewed or amended certificate, or cancelling the original certificate, in the case of additions or alterations to the building. It is quite possible that the condition of things in the buildings may be so changed in course of time that the certificate may become untrue and worthless. But the powers of the local authority will have been exhausted, and so the object of the section will be defeated, at least with regard to new factories. This defect will probably be found to be a serious one requiring amendment, and it might be well for this Association to draw the attention of the Board of Trade to this serious omission.

AN ILLUSTRATED HISTORY OF FURNITURE.*

MR. FREDERICK LITCHFIELD has, for a moderate price, produced a copiously and well-illustrated volume descriptive of furniture from the earliest to the present time, handling his subject with no small degree of knowledge, and conspicuously so in a popular manner. In such a guide necessarily much of the familiar ground to the specialist has been gone over, and many examples previously depicted by other authorities are illustrated, some old friends from other books occasionally finding a place among the specimens herein grouped together in chronological order. The author acknowledges in the preface that his illustrations have been made from examples of established authenticity, and his endeavour has been made to produce a panorama which may prove acceptable to many, who, without wishing to study the subject deeply, may desire to gain some information with reference to it generally. The volume, which is well got up, and does good credit to the publishers, Messrs. Truslove and Shirley, will therefore interest a considerable class of readers, for most people nowadays take an intelligent pride in the fittings and furnishings of their homes, even when making but little claim to the merit, if so it may be called, of purity of style, or the harmonious character of all their furniture.

The archæology of the subject carries the student back to the gopher or cypress wood of the ark, and the Biblical account of the erection of the Tabernacle some 1500 years before Christ gives some idea of the skill acquired even at so early a date in the use of the several woods available, and the tools adapted for their employ-

ment. The existing remains of Assyrian and Egyptian furniture in the British Museum, to say nothing of the Greek and Roman designs on antique bronzes and paintings, furnish a considerable series of valuable instances of unquestioned authenticity, and thus on through the Middle Ages, when, as in all periods, the history furniture really becomes so entirely a part of the development of the manners and customs of the people, that to acquire a knowledge of the one necessitates, at any rate, some acquaintance of the other. Local influences, too, come in according to the materials available and the special tastes of the times, and combine in leaving indelible marks upon contemporary furniture, as upon other things, which is unmistakable. The historic chair of St. Peter, the Dagebert chair in the Musée de Souverains at Paris, and our own Coronation Chair at Westminster Abbey are all fairly early examples of very differing types. Mr. Litchfield furnishes drawings of these, with reproductions from Viollet le Duc's clever restorations, indicative of what he conceived the interiors and furniture of the Middle Ages to have been like. The miniatures also, which are here represented, serve the reader with some more reliable particulars. Of the furniture of the Renaissance, of course, a by far larger number of examples actually exists, more or less, all over Europe in churches, museums, and private collections. From this period and style, which includes a wonderfully diversified variety of design and workmanship, we illustrate some of Mr. Litchfield's instances, and in this way afford our subscribers with the best possible evidence of the worth of the book to which our references apply. The first of these specimens is a French Renaissance bedstead, once belonging to Jeanne d'Albert, mother of Henri Quatre, who was born at Paris in 1553. It belongs now to the National Collection, made by the French Government from various old palaces and chateaux. The rich, warm tint acquired by time has naturally added to the beauty of the work, and its carvings remain sharp and fairly perfect. The lines of the piece are somewhat severe, reminding us of the Earlier Gothic work in this respect as well as in some other particulars, such as the vertical panelling on all sides of the inclosure. The same feeling is observable in the Elizabethan wainscoting, which comes from a house in Exeter, though the detail is perhaps more refined in some of the ornamentation. The date assigned to this is 1550-75, and the specimen is now at South Kensington Museum, which collection includes a beautiful room from Sizergh Castle, Westmoreland, one of the most remarkable examples in existence. It should have been illustrated in this volume. We gave a drawing of it on April 24th, 1891. The Jacobean oak sideboard of William and Mary's time is very Dutch in its details, with its variety of panels to the drawer fronts in the main body. It is now at South Kensington. The "drawings" table is somewhat earlier in style, probably of Charles II. reign, with stained pearwood lines let into the oak, and acorn-shaped legs peculiar to the period. The contrivance of the "Drawings" table was invented in the days of Charles I. It consisted of an arrangement by which two flaps drew out, the one from either end, and by means of a wedged-shaped piece between, the centre or main table top was lowered, and the whole table, thus increased, became flush at one level. Mr. Litchfield follows up his chapter on Jacobean work with one on the Furniture of Eastern Countries, chiefly illustrating Japanese and Indian varieties. The French style naturally occupies considerable attention, with notices of Colbert, Lebrun, and Boule. Marqueterie and Lacquer work are subjects upon which Mr. Litchfield has a special knowledge, and the Jones collection at Kensington furnishes him with not a few of his best specimens. Chippendale and his contemporaries bring us down to our last illustration, which shows an uncommonly pretty satin-wood dressing-table with painted decorations, and dating probably from the end of the 18th century. At this time satinwood was introduced into England from the East Indies, and became very fashionable with medallions of figure subjects painted on. In this work such artists as Pergolesi, Cipriani, and Angelica Kaufman possibly found lucrative employment occasionally, when not engaged upon larger works, such as ceilings and frieze ornaments. Pugin's Gothic and the Early Victorian styles are represented, and the 1851 Exhibition is called under review with some strange productions by Hollands,

Jackson and Graham, and Crace. Some very good modern French pieces are also shown, but we cannot say that an adequate representation is made of English designers' work during the past twenty years. The Arts and Crafts exhibitions are named, and the Home Arts and Industries Association is mentioned with one example of that society's productions, viz., the "Ellesmere Cabinet"; but the work of such men as Norman Shaw and E. W. Godwin, W. Burges and Webb are passed by with only a tabulation of their names. Eden Nesfield, and some others who have done worthy work in this connection, are not even spoken of—Talbert, for example. We have thus glanced through the volume with our readers, and can conclude by saying that they will find it quite worthy of the estimate indicated by the opening paragraph with which we commenced this review.

OBITUARY.

THE profession of architecture in Montreal has suffered a serious loss in the death of Mr. W. T. Thomas. Mr. Thomas was one of the best known architects in Canada, and still in the prime of his usefulness, being only 64 years old at the time of his death. His death will be much felt in Montreal.

The death of Mr. Thomas William Helliwell, patent glazing manufacturer, Brighouse, took place on Tuesday very suddenly. When quite a young man, Mr. Helliwell commenced business as an architect in Brighouse and Huddersfield, and soon acquired an extensive connection. Subsequently he brought out a patent for an improved system of glazing, which he largely developed, and in connection with which he established a wide and extensive home and foreign connection. He formerly lived at Thorpe Green Hall, near York, but some time ago again took up his residence at Raistrick.

Mr. William Cheiaka, for many years the county surveyor of Herefordshire, a post from which he retired a few months since on account of ill-health and advancing years, died on Monday at his residence, Pen-y-Bryn, Hafod-road, Hereford. He was 63 years of age.

Edwin H. Wootton, asphalt manufacturer, of Broadway and Lexington-avenue, New York, died at Saratoga recently from a complication of diseases. Mr. Wootton was born in England in 1835, in the neighbourhood of Canterbury, and when 17 years old went to New York, with the interests of which city he has been identified for forty years. He started in the house of A. T. Stewart and Co., and afterwards was a partner of a flour-mill business. The firm having decided to close up their business, Mr. Wootton purchased in 1874, from the assignees of a defunct asphalt company, their plants and properties, and shortly after he was appointed sole agent in the United States and Canada of the Compagnie Générale des Asphaltes de France. Mr. Wootton was a member of the Engineers' Club, and popular amongst engineers and architects, being regarded by many as the highest authority in the United States on the uses of rock asphalt. He leaves a widow, two sons (the younger being engaged in his father's business), and an unmarried daughter.

CHIPS.

Mr. A. P. J. Cotterell has been instructed to thoroughly overhaul and reorganise the drainage of the Clergy Daughters' School, Bristol.

At a vestry meeting held at Oundle last week, it was decided to proceed with the first portion of the restoration of the church, in accordance with the report prepared by Mr. J. T. Micklethwaite, F.S.A. The present work is the recovering of the roof, and will cost £450.

Major-General H. D. Crozier, R.E., and Mr. Thomas W. Thompson, of the medical department of the Local Government Board, attended at St. George's Hall on Friday, and held an inquiry with regard to the application of the Toxteth Local Board to borrow £5,700 for the construction of a refuse destructor, £6,400 for works of sewage and street improvements, £4,900 for additions to the hospital, and £400 for a public mortuary.

The local board of Gorton, near Manchester, have adopted a scheme of sewage purification and drainage prepared by Messrs. Lomax and Lomax, of Manchester and Bolton. The estimated cost is £23,905.

ILLUSTRATIONS.

YORKSHIRE PENNY BANK.—ST. AUGUSTINE'S CHURCH, TONGE MOOR.—NEWCASTLE-ON-TYNE CITY LUNATIC ASYLUM.—SUGGESTIVE DOMESTIC WORK IN STONE.—A VILLAGE INSTITUTE.—RENAISSANCE FURNITURE.

Our Illustrations.

YORKSHIRE PENNY BANK, BRADFORD.

THESE buildings are now in course of erection on a prominent site at the junction of North-parade and Manor-row, and are being erected of local stone. The architect is Mr. Jas. Ledingham, F.R.I.B.A., Bradford. Our illustration is reproduced from a drawing exhibited in the recent Royal Academy.

ST. AUGUSTINE'S CHURCH, TONGE MOOR.

THIS church, which has been recently erected, is situated in a thickly-populated township on the outskirts of Bolton-le-Moors, and will accommodate about 600 people. It has been built from the designs, and under the supervision, of Mr. R. Knill Freeman, F.R.I.B.A., of Bolton and Manchester, the materials employed being Yorkshire stone parpontos, with red Rainhill stone dressings, the internal dressings also being in red Rainhill stone. The chancel is lofty, of good proportion, and well elevated, the vestries, &c., being placed underneath, while the principal entrance has been placed at the north-west end. An organ-loft is provided over the north chancel aisle; the nave is wide, and the aisles, separated from it by arcades, are used as passages only. The style is Late Decorated, and the general contractors for the works were Messrs. Woods and Son, of Bootle, near Liverpool.

CONSLIDGE ASYLUM EXTENSION, NEWCASTLE-ON-TYNE.—SELECTED DESIGN.

THE ground plan and views we give are of the design placed first by Mr. George T. Hine, F.R.I.B.A., the assessor in the recent competition for the extension of the asylum for the city and county of Newcastle-on-Tyne. The present buildings, which accommodate over 400, will be adapted for female patients, and the extension will be devoted entirely for male patients. The accommodation is as follows:—Recent, 29; sick and infirm, 50; epileptics, 57; acute, 32; convalescents, 29; chronic and working, 152; total, 349. The chapel and recreation hall are placed between the existing and proposed buildings, to be used for both. An isolation hospital for 10 patients will be erected to the north of the asylum, and have a separate administrative department. A new residence for the medical superintendent will be placed to the south, quite clear of the asylum buildings. There will also be a new entrance lodge, and 10 semi-detached cottages for attendants. The whole of the buildings will be erected of stone, and covered with best Bangor slates. The floors and the ceiling of the upper story will be of fireproof construction. The woodwork will be of pitchpine and yellow pine. The lavatories, bathrooms, and closet annexes will be faced internally with

glazed bricks. The staircases will all be of fireproof construction, and outside the closet annexes there will be iron escape stairs. The heating and ventilation will be by a system of propulsion. The air forced through trunks underground, passed through batteries of steam-coils at the entrance to each block, and admitted at the upper part of the rooms. The vitiated air will be taken out at the floor level into trunks communicating with shafts carried up in the well of staircases. A fire main service will be laid inside and outside the buildings, and hydrants placed in the lobby to each closet-annexe. The estimated cost of the buildings, forming roads, and airing-courts is between £70,000 and £80,000. This does not include the cost of alterations to the existing buildings. Operations will be commenced as early as practicable. Mr. John W. Dyson, M.S.A., of Newcastle-on-Tyne, is the architect.

SUGGESTIVE DOMESTIC WORK IN STONE.

THESE old houses, located in four different counties where stone is abundant, represent in a typical way the natural and simply artistic use of the material most ready to hand. In neither of them is displayed a needless effort after mere prettiness or meretricious effect so often conspicuous in work of the present day, for their builders seem to have depended entirely on the practical requirements of the buildings which they had to design for the architectural character which they so admirably obtained. It is, of course, true that no small degree of the artistic quality belonging to these old houses comes of the mellowness given by time, which alone can impart the exquisite tones and tints so dear to all who have any appreciation for colour and harmony of shade. But, on the other hand, it is scarcely possible to conceive that at any period of their history these buildings could have looked really hard and mechanical in the way which characterises most of the more ambitious productions of more recent years. Nowadays economy of space and material necessarily press more uncompromisingly upon the architect, who no doubt often is limited by conditions unknown to the designers of such historic examples as these sketches represent. Restricted frontages, the requirements for lofty rooms with unbroken ceilings, and the utmost amount of light for every part of the interior of the dwelling, wherein every inch of room is required to be made available for use. These are difficulties of which every planner knows full well the reality, though very few possess the ability to overcome, or perhaps take the trouble to meet, such problems thus presented in the same way in which the old builders evidently would have done. How to successfully solve such demands upon the architect's skill, both artistically and practically, can only be really acquired by a study and intimate acquaintance of works by the best masters of the past, so that by realising the relative values of solid and void, the sense of good proportion, the need of good detail, and, above all, a well-conceived skyline, the spirit of true architectural merit may be imparted to our buildings without any real sacrifice of their utility and reasonable inexpensiveness. Viewed in this sense, the studies which our accompanying sheet presents really do afford suggestive examples at once entirely natural in style and unambitious in aim. Take, for instance, the little manor house at Water Eaton, near Oxford, and mark the dignified character of its plan with the two smaller buildings on either side of the quadrangle, which is further enhanced by the small church or chapel adjoining. This latter, for the purposes now in mind, may be taken as merely an accessory not always possible. The dwelling, placed in the midst of a farm holding, has practically unlimited surroundings of meadow land and fields, unmarked by special features. Without some sort of rigid inclosure, the house would be devoid of that cosiness and sense of retreat so essential to the character of home. The builder, therefore, not attempting to vie with nature, adopted a simple contrast to its charms by building a small quad, and in front erected piers between which open-work timber gates are hung, and a paling fence by which the view is enhanced rather than obscured. Here the good taste of the time prescribed a little formal garden with its straight walks and Old English flower-beds set out in a pattern, like the façade of the house to which such a garden more immediately belongs. Turning into the building, the common living-room, still known as the hall, occupies the

leading position, placed so as to emphasise the elevation as well as the plan. The withdrawing room is more out of the way on the other side of the entry, and bears a proportionate recognition in the treatment of the façade. The house is fairly well kept as a farmhouse, but the forecourt is now entirely covered with grass, and so the main idea of the original builder has been quite lost sight of. South Wraxall Manor is a much larger and more important place, of course, quite famous among the Domestic architecture of England. Whole pages might be written about it. For the limit of these notes, however, to-day, the possibility which the building displays for the introduction of big windows may be mentioned; in fact, the end of the drawing-room is practically all glass, almost enough for a Strand shopkeeper's window, and yet the effect is reposeful and admirable. The quadrangle which this window commands was no doubt once set out as a garden, such as that already referred to as at Water Eaton. The doorway to the right of the sketch leads to the big hall of the house, which runs the whole height, and has an open-timbered roof and a great screen with a minstrels' gallery over it. Haddon Hall needs no description, as everyone knows the celebrated Derbyshire home of the Vernons. This side of the lower quadrangle here sketched has not been so often illustrated as other parts of the building. The value of breadth in plain walling is here the suggestive note, and the small, simple bay windows leave nothing to be desired in the way of correct proportion. Of the almshouses at Marshfield, an out-of-the-way picturesque village with one long, quaint thoroughfare overlooking the Bath country from the verge of the Gloucestershire hills, are exactly what they were intended to be—a row of dwellings for aged villagers by the roadside in continuation of their old street. The inclosing wall protects the inmates from intrusion, and the gateway adds dignity without undue ambition. The porch and gable over it, enriched with an heraldic panel, lead up to the clock-turret, which is of great value in the composition without competing with the parish church tower, for that is at the other end of the village. Each dwelling has a dormer of its own breaking the eaves pleasantly, and all seems well in scale, which observation affords a suggestive note worth something, while our designs fail, perhaps, in this respect more than in any other. Further drawings of South Wraxall Manor, with plans of the house, will be found in the BUILDING NEWS for Aug. 12 and 19, 1887, and others of Haddon Hall in our issues for April 2 and 16, 1875; April 2, 1878; July 6 and Oct. 5, 1883; July 11, 1884; Aug. 17 and 24, 1888; with descriptions in all cases. The other examples have not before been illustrated in the BUILDING NEWS.

M. B. A.

AN ILLUSTRATED HISTORY OF FURNITURE.

SEE description on p. 174, with our review of Mr. Fredk. Litchfield's new book on this subject.

CHIPS.

THE death of John Taylor, R.C.A., landscape painter, occurred on Thursday, the 29th ult., near Llanbedr, in the Conway Valley. The deceased was a native of Manchester, and besides being a member and regular exhibitor of the Cambrian Academy at Plas Mawr he was also an associate of the Manchester Academy, to which institution he was a frequent contributor.

Major-General Crozier, R.E., an inspector of the Local Government Board, held an inquiry at Rugby on Friday with regard to the local board's proposal to borrow £5,000 for the extension of the cattle market at Rugby, and £1,100 for the purchase of a site in the parish of Bilton for the erection of a hospital for infectious diseases.

The design sent out by Mr. George Wade, London, in competition with many others, has been chosen for a bronze statue to be erected in Hamilton, Canada, of the late Sir John Macdonald. The marble memorial which he has now completed of the same distinguished statesman has been unveiled in St. Paul's Cathedral, London, this week.

Nearly two years ago the experiment of painting and gilding the interior of the choir of St. Paul's Cathedral was commenced under the direction of a large committee appointed by the Dean and Chapter. It is now announced that, by the advice of Sir Frederick Leighton, P.R.A., and Mr. W. B. Richmond, R.A., the experiment will be abandoned and the walls restored to their original appearance. The architects, Messrs. Bodley and Garner, have concurred in the discontinuance of the work.

CHARLES II. "DRAWING" TABLE.

WILLIAM AND MARY OAK SIDEBOARD, KENSINGTON.

ENGLISH SATINWOOD DRESSING TABLE WITH PAINTED DECORATION.—
END OF EIGHTEENTH CENTURY.

CARVED OAK BEDSTEAD OF JEANNE D'ALBERT, 1562,

OLD WAINSCOTING FROM HOUSE IN EXETER, 1550-75.

WAYSIDE NOTES.

SOMEONE has been saying things derogatory to the artistic reputation of the students at South Kensington, and Messrs. Buckmaster, Preston, and Alexander Wood have made replies in their behalf. It having been reported that the South Kensington students were not so successful in the examination this year as heretofore, the statement has been refuted, and a position in the national competition claimed as distinctly the highest. It would certainly be a great disgrace if students at headquarters did not maintain a premier place in the yearly trial of skill. The large towns may prove powerful competitors, but they should scarcely be able to render a better account of themselves. The *Standard* correspondents say that the South Kensington students have gained five gold medals out of twelve, twenty silver medals out of sixty-seven, fifty-four bronze medals out of one hundred and eighty-nine, and a large proportion of the whole number of book prizes. In a word, the six hundred and forty S.K. students have secured more than one-fourth of the total awards competed for in the United Kingdom. This looks well enough, certainly; and if the real artistic work is in true proportion to the prizes, there should be nothing about which critics can complain. The students may be said to have cleared themselves of the charges made, and that without the help of the Departmental authorities and administrators. It only remains for us to recommend that they strive arduously in future years to further establish their pre-eminence.

Another R.A. exhibition has been brought to a conclusion. I was at the galleries on Saturday, and spent some time in the architectural room before the end of the show. It occurred to me that if the ordinary frequenter of the Royal Academy Galleries took any interest whatever in the architectural room, then assuredly would the question be frequently put, "Do architects ever make their own drawings?" The number of "perspectives" in this year's exhibition bearing a name other than that of the architect of the work is more noticeable than ever. One of the discoveries of this generation of architects has been that the same design drawn by different hands may look good, bad, or indifferent, according to the skill of the draughtsman; and further enlightenment in the same direction has proved that, in the hands of an artist, a positively repulsive design may be made to appear not merely inoffensive, but actually pleasing. Touch, light and shade, and a wary omission of undesirable and awkward features work wonders.

To architects the exhibition loses much of its interest from this cause. The great pleasure of seeing a design drawn by the architect's own hand is gone. Surely, if Mr. Waterhouse can find time and opportunity to prepare a perspective drawing for the exhibition, other less employed architects can do the same. Evidently it is not a matter of time or opportunity at all, but simply a knowledge of the value of the services of a fashionable architectural perspective-maker. It is probable that if the selection of the drawings to be hung in the architectural room were in the hands of a committee of architects of whom the profession would approve, much of this evil would disappear. What we all like to see is the handiwork of the man, and not somebody else's idea of the completed building. A thumbnail sketch by an able architect is in such cases of far higher interest than an elaborated representation by another hand. If things were as they should be, a rough sketch on a scrap of paper would have more chance of acceptance at Burlington House than the most elaborate and highly-finished "perspective"—vile word.

Attempts to upset awards, elections, and the like, do not afford any attraction to me, and I am therefore glad to see that the A.A. committee remain as heretofore. If Mr. Gerald Horsley has been badly treated, let justice be done; but to say that because of this the whole committee shall be re-elected, is an argument not to be supported by logical reasoning. Ends in view other than the mere righting of an injustice are discernible. Let the present committee as duly elected by a majority of members continue in peace to enjoy their tenure of office. Those inclined to revolutionary ideas had best take a holiday and endeavour to come to a different

frame of mind. Try sketching and measuring Early English mouldings.

On Monday a poll-tax upon passengers passing between Dover and Calais was instituted for the purposes of raising money for the construction of the new harbour at Dover. At a tax of 1s. per head, it is estimated that a revenue of about £14,000 a year will be gained. The tax may be good or not, but the proposed harbour is decidedly good. Dover—so I have heard—is a nasty place to get into in dirty weather, excepting to those navigators accustomed to daily passing in and out of the harbour. The captain of an Atlantic liner may not be competent to take a penny steambot from London-bridge pier to the Surrey side with a strong tide setting down the river. So I should imagine it is also something of the nature of a trick gained only by constant practice to "make" certain harbours on our coasts; and if Dover is to be improved in this respect, many skippers will be glad.

I hear of a "moving roadway" as a proposed feature for the Paris Exhibition of 1900 A.D. By that date we might have such things as practical and ordinary adjuncts to City life, and one would step on at the Bank and in due course arrive at the Strand. Why, if I am rightly informed, a travelling sidewalk has been arranged for the Chicago "Exposition"! At the charmingly situated Inversnaid Hotel at Loch Lomond, I met a clergyman from Frisco, who explained the whole thing. There are to be three divisions of this travelling side-walk. The first is to move very slowly, and the two others at increased speeds. Thus, apparently, one may stand quite still and yet see all the fun of the fair.

The proposed "moving road" for Paris would commence at the Arc de Triomphe and carry the visitor past the Neuilly Bridge to the Exhibition. The "roadway" would be divided into three longitudinal sections, one for direct transport, one for a return journey, and the third for enabling the "passenger" to visit the restaurants, &c., on the route. The entire breadth of the Avenue de Neuilly would, it is said, be occupied. The idea is evidently taken from the travelling footway that is to be a feature at Chicago next year, as above described.

There is something pitiable about the fearful ignorance of the Russian peasantry with respect to the uses of disinfectants for the cholera epidemic. It passes our comprehension to understand a state of things where a people will break out in revolt against sanitary measures of a necessary kind. Yet only a few days ago at Tashkend, the capital of Russian Turkestan, a riot occurred in which some 65 persons were killed and over 100 wounded. To spread about a disinfectant evidently gives persons of such low intelligence the idea that the authorities are poisoning them. Tashkend is not, properly speaking, Russian, and the Tarts are evidently a rough, uncivilised community; but much the same antipathy to sanitary measures appears to be rife in other and more purely Russian districts.

It may be that the solution of the difficulty with regard to the high cost of electric lighting as compared with gas is to be found in municipal or parochial installations. The parish of Islington, encouraged by the successful example of St. Pancras, is about to make an experiment in this direction. St. Pancras has managed to make a small profit with its electric lighting, which is a great thing, and likely to influence many of the Metropolitan vestries in the question of lighting. The charge contemplated by the Islington vestry is 6d. per unit—rather a vague quantity to such of us as have not been "consumers" of electricity for lighting purposes, but one which we shall hope will compare favourably with gas. The high price of the electric light has lately been the great obstacle to progress; but it may be that where companies do not answer, municipal authorities may succeed.

GOTH.

The memorial stones of a mission hall were laid in Rochester-street, at the rear of Brighton College, by the Mayor of Brighton, on Friday. The building is of red brick, will measure 56ft. by 23ft., and will accommodate nearly 300 people. Mr. W. H. Nash is the architect and Mr. G. R. Lockyer the builder.

CONVALESCENT HOME FOR CORNWALL.

THE Convalescent Home which Mr. Passmore Edwards, of London, the proprietor of the *Echo*, the *Weekly Times* and *Echo*, and the *Building News*, has given to the county of Cornwall, was formally opened on Monday at Perranporth, near the village of Blackwater, where Mr. Passmore Edwards was born, and where lived the mother to whose memory he has erected this Home. The Home is a substantial and very nice-looking erection, standing in a considerable plot of land capable of being laid out to considerable advantage as pleasure grounds. Built of a bluish local stone with granite and brick facings, the Home was designed by Mr. John Symons, of Blackwater, and built by Messrs. John Symons and Son. Some amount of excavation was necessary at the back of the building, which occupies ground about 60ft. square, consists of ground floor, first floor, and attics, with a splendid balcony 23ft. by 16ft., fronted by an iron palisading, and with the name "Convalescent Home" cut upon a granite course below it, in the centre of the façade. On the ground floor are the library and reading-room, day-room, and dining-room, all in front, with the kitchen communicating the dining-room, matron's room, and other most convenient rooms and offices upon the other side of the main corridor. The twenty beds for patients are mostly upon the first floor, fine, lofty, well-lighted rooms, approached by a wide staircase with a pretty pitch-pine balustrade. There are other conveniences, such as linen closets heated by hot air, and altogether the establishment is in every detail complete. Mr. Passmore Edwards has bought the ground, erected the building, furnished it, hung the walls with pictures, and provided a library. Some of the larger furniture, dressers, and cupboards and tables, have been made by the builders, Messrs. John Symons and Sons. The rest of the furniture was supplied by Messrs. Criddle and Smith, of Truro.

CHIPS.

The new Roman Catholic church, dedicated to St. Martin, at Trant, N.B., was opened for worship last week. The church has been built from designs prepared by the late Mr. J. Biggar, architect. It is a simple Gothic structure, consisting of nave and chancel, and seated for 420 persons. The altar is constructed of white Seaton stone, elaborately carved, with shafts of alabaster supporting the altar-table, a crocketed canopy over the tabernacle, and statues of St. Martin, St. Margaret, St. Andrew, St. Patrick, St. Bridget, and St. Columba set in canopied niches. Together with the chapel-house which adjoins it, the church has cost £2,000.

The freehold of Barnard's Inn has been sold to the Mercers' Company for the purpose of transferring their school from College-hill to a more extensive building to be erected on the site, the area of which is 28,000ft.

The annual congress of the Cambrian Archaeological Society will open at Llandello on Monday next.

St. John's Church, Gannow, near Burnley, has been reopened after being completed at a cost of £4,500, which has been met by Sir John H. Thursby. The church, as now completed, has cost over £13,000.

A series of pictures, 24 in number, are to be placed in the ambulatory of the London Royal Exchange, the subjects to represent scenes in the history of the City. A list of well-known artists is to be drawn up, and a subject allotted to each. Sir Frederick Leighton has offered to execute one of the designs on a panel, and present it as a gift; and Mr. Deputy Snowdon has undertaken to present another picture, the subject chosen by him being the opening of the present Royal Exchange by the Queen in 1842.

The new chapel at the union workhouse at Oundle, erected at a cost of over £1,000, was recently dedicated by the Bishop of Peterborough. A large quantity of Weldon stone was given by Earl Winchelsea, while the expense of building has been met by voluntary effort. Messrs. W. Bucknel and J. N. Cooper, of Westminster, were the architects, and Mr. J. W. Ireson, of Oundle, the builder.

A stained-glass window has been placed in St. Margaret's Church, Westminster, in memory of the late Sir Goldsworthy Gurney, C.E., the ventilating engineer of the Houses of Parliament, and the inventor of the Bude light and of flashing signals. The window was designed by Mr. Edward Frampton, and was unveiled on the 28th ult. by the Duke of Wellington.

First Floor:

Ground Floor:

A VILLAGE INSTITUTE.

A VILLAGE INSTITUTE.

THIS is a design for a Workman's Institute for a village in the Midland Counties. The design being carried out is a modification of the drawing. Messrs. Grayson and Ould, of 31, James-street, Liverpool, are the architects.

THEATRE REGULATIONS IN NEW YORK.

THE New York Building Act lately passed prescribes various rules for the construction of theatres in that city. One of these is that every building shall have at least one front to the street with means of entrance and exit. There is to be also reserved for service in case of emergency an open court or space on the side not bordering on the street where said building is

located on a corner lot, and on both sides where there is but one frontage to the street. The width of such open court or courts is not to be less than 7ft. where the seating capacity is not over 1,000; above 1,000 and not more than 1,800 people, 8ft. in width; and above 1,800, 10ft. in width. These courts are to begin at or near the proscenium wall, and extend the length of auditorium, and to have separate corridors to the street through any superstructure that may be built on the street side of auditorium. The corridor walls and ceiling to be fireproof. Exits are to be at least 5ft. in width, and have doors of iron or wood of certain construction. These doors are to be open outwards, and be fastened with movable bolts, drawn during performances. Balconies not less than 4ft. wide are to be provided in the courts at each level or tier above the parquet on each side of auditorium of sufficient length to embrace the two exits, and from the

balconies staircases shall extend to the ground level, with a rise of not over 8in. to a step, and not less than 9in. tread. That from the upper balcony to the next below is not to be less than 30in. in width in clear, and from the first balcony to ground 3ft. in clear when the seating capacity of auditorium is for 1,000 or less; 3ft. 6in. in clear when 1,000 and not more than 1,800 people; and 4ft. in clear when above 1,800 people and not more than 2,500 people; and not over 4ft. 6in. wide when above 2,500. These balconies and staircases are to be constructed of iron throughout, and they shall be covered with a metal hood. Where one side of building borders on a street, there are to be balconies and staircases of like capacity and kind carried to the ground. It is permitted to construct a roof-garden, art gallery, or other rooms above a theatre, provided the floor between be constructed of iron or steel and fire-

proof materials. The other provisions relate to the proscenium opening—fireproof curtain of metal or asbestos, &c.

THE BRITISH ASSOCIATION AT EDINBURGH.

A CENTURY OF PROGRESS IN GEOLOGICAL SCIENCE.

THE sixty-second meeting of the British Association was opened on Wednesday by an address from the president, Sir Archibald Geikie, the Director-General of the Geological Survey of the United Kingdom, who took as his text the progress made in geological science during the 100 years that have elapsed since James Hutton published in that city his "Theory of the Earth." Hutton's theory, that the changes and decay now in progress on the earth's surface afford an explanation of those which must have occurred in earlier times, was elucidated and expounded by his friend, Playfair, and by slow degrees the public learned to extend the time to be granted for the development of Nature's operations on the surface of the globe. In the course of an interesting address, couched in lucid and popular terms, Sir Archibald sketched the quarrels between the followers of Hutton and Werner, the Plutonists and Neptunists, as they were dubbed, from the relative stress they laid on the agents of subterranean heat and of rainfall, the effects of the observations and generalisations as to stratified rocks by William Smith, and then the manner in which William Thomson (now Lord Kelvin) aroused men from the intellectual torpor into which a belief in the extreme theory of uniformitarianism had lulled them by demonstrating that the whole evolution of the earth had been comprised within certain definite limits. Modern investigation had still further reduced the limit of time given by Lord Kelvin for the earth's age, from a hundred million years to twenty, or possibly, as Tait urged, even ten million years. Sir Archibald next described in picturesque language the transformation which overspread the earth during the Ice Age, when the glaciers of the Arctic regions crept southward over Europe, extirpating the lions, hyenas, and hippopotami, replacing them by the reindeer, woolly rhinoceros, and mammoth, and showed how the evidence of successive races of plants and animals, taken in conjunction with the imperceptible development of type in flower, bird, mammal, or human race during the four or five thousand years that have elapsed since the earliest men lived in Egypt, conclusively proved the long period that must on any hypothesis be given to the duration of life on this globe. Sir Archibald closed with the following geological retrospect:—

If, standing on the Castle Rock, the central and oldest site in Edinburgh, we allow the bodily eye to wander over the fair landscape, and the mental vision to range through the long vista of earlier landscapes which science here reveals to us, what a strange series of pictures passes before our gaze! The busy streets of to-day seem to fade away into the mingled copsewood and forest of prehistoric time. Lakes that have long since vanished gleam through the woodlands, and a rude canoe pushing from the shore startles the red deer that has come to drink. While we look, the picture changes to a Polar scene, with bushes of stunted Arctic willow and birch, among which herds of reindeer browse and the huge mammoth makes his home. Thick sheets of snow are draped all over the hills around, and far to the north-west the distant gleam of glaciers and snow-fields marks the line of the Highland mountains. As we muse on this strange contrast of the living world of to-day the scene appears to be more Arctic in aspect, until every hill is buried under one vast sheet of ice, 2,000ft. or more in thickness, which fills up the whole midland valley of Scotland and creeps slowly eastward into the basin of the North Sea. Here the curtain drops upon our moving pageant, for in the geological record of this part of the country an enormous gap occurs before the coming of the Ice Age. When once more the spectacle resumes its movement the scene is found to have utterly changed. The familiar hills and valleys of the Lothians have disappeared. Dense jungles of a strange vegetation—tall reeds, club-mosses, and tree-ferns—spread over the steaming swamp that stretch for leagues in all directions. Broad lagoons and open seas are dotted with little volcanic cones which throw out their streams of lava and showers of ashes. Beyond these, in dimmer outline, and older in date, we descry a wide lake or inland sea, covering the whole midland valley, and marked with long lines of active volcanoes, some of them several thousand feet in height. And still further and fainter over the same region, we may catch a

glimpse of that still earlier expanse of sea which in Silurian times overspread most of Britain. But beyond this scene our vision fails. We have reached the limit across which no geological evidence exists to lead the imagination into the primeval darkness beyond.

The full text of the address will be found in to-day's issue of the *English Mechanic and World of Science*.

COMPETITIONS.

WALSALL.—The preliminary competition of plans for the town hall at Walsall is decided. The committee, after careful consideration of 39 designs sent in, have awarded the two premiums as follows:—1st, Mr. John R. Withers, Shrewsbury; 2nd, Mr. Daniel Arkell, Birmingham. The official report says:—"As from the designs sent in it is clear that a hall sufficient to meet the requirements of the town can be erected on the suggested site, it is the intention of the committee to recommend the council to offer in competition three premiums of 100, 75, and £0 guineas respectively for complete designs, including specification and estimate of cost. If this recommendation is adopted, notice of the competition will be given in due course. In coming to a decision on any new designs which may be submitted, the committee will not be fettered in any way by those which have been awarded the premiums in the preliminary competition, which was for the purpose of ascertaining the maximum accommodation which could be obtained on the site." No professional referee other than the town surveyor was employed to assist in the above award and no one was allowed to see the plans, so that it is by no means certain that the best designs were premiated. If the competition as above foreshadowed is adopted by the council, it is to be hoped that an architect of eminence will be employed as arbitrator.

CHIPS.

The funeral of Mr. Robert Thompson, who had been surveyor to the Waterloo-with-Seaford Local Board for over 17 years, took place on Saturday in St. Luke's Churchyard, Great Crosby.

On Saturday the district church of St. Hilda's, Hedgefield, in the parish of Ryton, was consecrated by the Bishop of Durham. Plans were prepared by Messrs. Oliver and Leeson, of Newcastle-on-Tyne, and the contract for the building was let to Mr. Pringle, of Newcastle. The building consists of a nave, with one aisle. It seats 350 people, and the cost has been £3,500.

The Dursley Rural Sanitary Authority have called in Mr. A. P. J. Cotterell, Assoc.M.Inst.C.E., to prepare a scheme of water supply for the town of Wotton-under-Edge, Gloucestershire.

The Steyning Board of Guardians have instructed their architect, Mr. Arthur Loader, of Brighton, to proceed with the preparation of the contract drawings and plans for infirmary buildings at New Shoreham, his sketch plans having been already practically approved by the Local Government Board. Mr. Loader was further instructed to prepare plans and specification for extensions to the old laundry buildings upon which to obtain contracts.

The Tate Laboratory and new classrooms which have been added to the Birkenhead Institute were formally opened on Monday. The laboratory has been provided by Mr. Henry Tate at a cost of about £1,000. It provides additional accommodation for 300 students, and has been erected from designs by Mr. T. Mellard Reade, of Liverpool, the architect of the Institute, to which the extension forms a new wing.

The sanitary committee of the Newcastle-on-Tyne city council have resolved to invite competitive plans for the building of a lodging-house, to provide accommodation for 300 men, upon a site in the Milk Market; also for a building to contain 50 single-room tenements on the Milner's Hill site; and also for a lodging-house to accommodate 100 women on a site in the City-road.

The finance committee of the Parish Church of Walsall have decided to substitute for the present choir stalls others more suited to the dignity of the fine chancel. Designs procured from Mr. J. L. Pearson, R.A., have been approved, and the execution of the work has been intrusted to Mr. Bridgeman, of Lichfield. The cost will be about £780.

At Lurgan, on Tuesday, a one-legged man was committed for trial on a charge of causing the death of a builder and publican named Archer. The prisoner undertook to cure Archer of erysipelas in his leg by means of a charm, but mortification set in and death ensued.

Building Intelligence.

ALNABREAC, N.B.—A shooting-lodge is at present being erected by Sir Tollemache Sinclair, Bart., near the Alnabreac Railway Station. The building is to contain 16 bedrooms, dining-room, drawing-room, smoking-room, billiard-room, gun-room, servants' hall, two bath-rooms, five lavatories, besides kitchen, gillies' apartments, &c., and the whole is estimated to cost nearly £4,000. The lodges are all connected by telephonic communication, and an abundant supply of water is supplied by gravitation. The architect is Mr. Donald Leed, of Thurso, and the contractors are:—Mason work, Peter Bain, Thurso; joiner, William Innes, Halkirk; slater, James Reid, Thurso; plumber, James Mercer, Thurso; plasterer, William Coghill, Lybster; and painter, James Tytler, Cramond, Thurso. With regard to Sir Tollemache's building operations, it may be of interest to state that during the last three years he has expended some £12,000, including cottages for farm servants, on his estate, and more of such are in contemplation.

CHALLOCK.—The reopening of the 13th-century parish church of Challock, which has undergone repair and renovation, took place on July 25th, the Archbishop of Canterbury attending. The chancel was partially rebuilt in 1873, and this portion remains in excellent condition. The present outlay in the nave has been about £1,350. The whole of the fabric, except the tower, has been restored, all the old portions and evidences being carefully preserved. The church has been re-seated and refloored, the ancient chancel screens have been cleaned, and the arcading restored. The font, which occupies an almost unique position behind the second column of the south arcade, has also been restored, together with the old roof and the windows. In the latter some ancient glazing, which has been used before, has been included, the original position being adhered to as far as possible. The old stoup discovered behind the south doorway has been renovated and preserved. The screens, which formerly belonged to the rood loft, are some of the finest in the country.

DUFTOWN.—The Free Church at Duftown, N.B., was reopened on the 27th ult. after alterations and additions. The church is almost of the form of a Roman Cross, and is built of the finest Spynic freestone. The most prominent feature in the exterior is a square tower, which is situated at one of the corners of the main front, and stands about 60ft. high. The main front is in gable form, and the principal feature is a five-light window, filled with cusped and foliated tracery, and, like all the other windows of the church, is of stained glass. The whole of the interior finishings are of pitch-pine varnished. The church is heated by the high-pressure system. Mr. James Souttar, architect, Aberdeen, designed and superintended the work.

OSWESTRY.—The Mayor of Oswestry laid, on Friday, the foundation-stone of the new municipal buildings. The new buildings are being erected on the site of the old Guildhall on the Bailey Head. The style is that of the 17th-century Renaissance treated freely. The exterior will be faced with Grinshill stone. A bas-relief of St. Oswald, the patron saint of the town, which was on the pediment of the old Guildhall, will be introduced into the new edifice. The municipal buildings are to include a central hall, council-chamber, magistrates' and county court room, town clerk's, borough surveyor's, magistrates' clerk's, and assistant-overseer's and county-court offices; rooms for the reference and lending libraries, and school of science and art, &c. The original architect was Mr. H. A. Cheers, of Twickenham; but his plan, at the request of the town council, underwent considerable alteration at the hands of Mr. T. M. Lockwood, of Chester, the consulting architect in the competition in which Mr. Cheers' designs were selected, and the work will be carried out under the superintendence of Mr. Lockwood. Mr. W. H. Thomas, builder, of Oswestry, is the contractor, the amount of the contract being £8,597.

The West Riding County Council have decided, in consequence of the increase of lunacy in the Riding, to enlarge Menstone Asylum by the addition of blocks for 600 chronic patients, at an estimated cost of £86,000.

Engineering Notes.

THE INSTITUTION OF MECHANICAL ENGINEERS AND THE DISPOSAL OF SEWAGE.—At the summer meeting of the Institute of Mechanical Engineers, held in the Town Hall, Portsmouth, on Friday, Dr. William Anderson, the president, occupied the chair. A description of the Portsmouth sewage outfall works was given by Sir Frederick Bramwell, who pointed out that the system was one which depended entirely upon the employment of steam-engines and pumps, and was therefore essentially one of mechanical engineering. In the case of seaside towns, such as Portsmouth, the simplest and most ready way of dealing with sewage when collected was to deliver it into the sea, choosing, if possible, some point where its delivery would not be a nuisance, and some point also where it could be caused to flow into a tidal or other current. In this particular respect Portsmouth was well placed. Mr. Cochrane, one of the council of the Institute, stated that Sir Frederick Bramwell had solved the problem of avoiding the reflex action of the sewage upon the town, and of so discharging it as to cause no nuisance elsewhere. It might be a question whether it was wise to send sewage out to sea at all. But if there were no means of discharging it on land there was cause for congratulation at Portsmouth that they were able to carry it right away to sea, never to return. In replying, Sir F. Bramwell said that there was no engineering problem so difficult as that of getting rid of the sewage of large towns. The question of the disposal of sewage again came up in a paper prepared by Mr. William B. G. Bennett, burgh engineer and surveyor of Southampton, who gave a description of the sewage precipitation works and refuse destructor at Southampton. The corporation in 1885 found it desirable to clarify by precipitation the sewage of a particular district, and also to introduce a more efficient system for the collection and disposal of house refuse. They therefore adopted a refuse destructor for destroying the ash-bin contents and garbage of the town, whilst it was arranged that all sewage sludge should be transmitted to the destructor from the two existing reservoirs, in which it was deposited in the process of clarification. The sludge, after mixture with road sweeping, turned out good manure, whilst the refuse was utilised for fuel. The initial cost of the complete destructor was £3,723, and the sewage disposal works on the town quay cost about £3,000—this sum, however, being exclusive of the cost of two other works.

CHIPS.

The members of the Manchester city council paid a visit of inspection last week to the sewage works, including the outfall works at Davyhulme, about four and a half miles from the city. For the construction of the works the corporation have power to borrow £500,000. Half of that sum has been already spent, and the works are rapidly approaching completion. It is expected that they will be in operation by the end of next year.

The Duchess of Teck laid, on the 28th ult., the foundation stone of the church of St. Barnabas, which is about to be erected on a site between the Woodward and Townley roads, Dulwich. The building will cost about £9,000.

Several villa residences are being erected in the neighbourhood of Burton-on-Trent, of which Mr. R. E. Carpenter, M.S.A., of Burton, is the architect. One at Tutbury, for Mr. W. Barker; one on Branstone-road, Burton, for Mr. C. O. Hall; and two semi-detached in Derby-street, Burton, for Mr. Collyer. The builder for the Tutbury residence is Mr. Dickinson, and for the Burton residences Mr. Hodges.

The committee of the Blind Asylum, Bristol, have instructed Mr. A. P. J. Cotterell, Assoc. M. Inst. C.E., of that city, to prepare and carry out a new system of drainage for their buildings.

Mr. Dyack has been appointed borough surveyor at Aberdeen at a salary of £400 a year, rising by £50 per annum till it reaches £600.

The County Council of Staffordshire have decided to purchase the Bank Farm, Cheddleton, for £12,750, as the site for the proposed new lunatic asylum. The farm covers 178 acres, and will cost £71 12s. 6d. per acre.

The death occurred on Wednesday, at Ixelles, Brussels, of the Belgian painter, Joseph Stevens, in his seventy-fourth year. He produced many pictures which were highly valued both in France and Belgium.

TO CORRESPONDENTS.

(We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.)

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 60s. 0d. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL, XLII, XLVI, XLIX, L, LI, LIII, LIV, LVIII, LIX, and LX may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. R. A. (Shrewsbury).—G. R. S. and Co.—F. R. G. S.—Scotia.—T. and M. B. Co.—B. N. T.

Correspondence.

LAND SURVEYING.

To the Editor of the BUILDING NEWS.

SIR,—In his letter of July 15th, "Northman" has made a serious mistake in his calculations; AF and AY are nearly equal, yet he assumes that AF is 1,570 links, and AY 592 links. This of course throws his figures out.

The remark that "even on a scale of three chains the length DEF will not alter more than two or three links," shows confused geometrical ideas, or at least language, for surely he knows that the scale upon which a field is plotted cannot alter the length of the lines relative to one another.

In Fig. 4, DB is perfectly checked by AF.

So far as I can make out, "Northman" claims that in the case of the triangle ACB, AY is an effective check on the length of AF, while EF is not. Let a be the position shown for A by incorrect chaining of AF; let f be then the position of F; let MF be parallel to YA; the difference between Ya and YA is the amount the check-line will appear too long, and the ease with which an error is seen is directly proportionate to this. If AF is half AB, the difference MF - Mf = $\frac{1}{2}$ (YA - Ya), owing however to EF being inclined to YA, EF - Ef = about $\frac{2}{3}$ (YA - Ya), so that an error is two-thirds as easy to detect by EF as by AY. This leaves us plenty of room to see at once if a material error has been made. In the case in point (Fig. 5), it was therefore deemed advisable to make this trivial sacrifice in order to pick up detail without a confusing and unnecessary number of lines. When it is impossible to measure AY, or where another check, such as FE, is useful to pick up detail, most triangles

can be sufficiently checked by a cross-line, which cuts off at least one-third of one side.

It is important to impress on students that a hard and fast rule, such as "always plot the

diagonal first," should not be allowed to override the needs of particular cases, every one of which demands a little extra study,—I am, &c., Gravesend, July 25. G. W. COBBHAM.

CHIPS.

The Corporation of Oldham, after careful consideration, have selected the improved patent mechanical system of Messrs. Baird, Thompson, and Co., ventilating engineers, as being the most efficient for their new scheme of ventilation for the town-hall and county buildings, and accordingly have placed the buildings and contract in their hands.

The new schools, Crathie, near Ballater, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

The parish church of Hanging Heaton is about to be restored at an estimated cost of £1,600. Mr. W. Swinfen Barber, of Halifax, is the architect.

A meeting of property owners was held at the Imperial Hotel, Morecambe, on Saturday, for the purpose of considering proposals for the erection of a new pleasure pier for the west end of the town. Mr. Harker, C.E., of Manchester, attended the meeting, and submitted plans for a new pier and pavilion for entertainments, the total cost of which was roughly estimated at about £30,000. It was unanimously resolved that it was advisable such an undertaking as the one suggested be carried out at the west end of the town. A committee of eleven gentlemen was appointed for the purpose of considering the details and the erection of the structure.

A gift was presented last week to Hereford Cathedral by the Rev. Canon Phillott, the gift taking the form of a brass lectern fashioned from the design of Mr. H. Prothero, of the firm of Messrs. Middleton, Prothero, and Phillott, of Cheltenham. It has been made by Messrs. Barkentin and Krall, of Regent-street, London.

A serious landslip occurred on Saturday evening at Mr. Robinson's slate quarry at Nantlle Vale, whereby the future working of the quarry will be for a time affected. The fall involved the dislocation of several thousand tons of the rock, completely covering the lower portion of the works. A slip had been expected for some days. The men employed in the pit had only cleared their implements out on Saturday afternoon.

The Meath Home of Comfort, at Godalming, for epileptic women and children, was opened yesterday (Thursday) by the Duchess of Albany. The mansion known as Westbrook House has been purchased by a lady, and adapted to the purposes of the home. Accommodation will be provided for 50 or 60 women and children.

In consequence of the increasing population of the Rhondda Valley, it is proposed to erect five new churches in the Vale. The suggested sites are at Treorky, Ynysfeio, Ystrad Rhondda, and Gelli-road, the fifth being a reconstruction of the existing parish church. The churches will seat from 350 to 500 persons each, and about £2,000 has been provided as the nucleus of a building fund.

By the collapse of a scaffold at Burns Mill, now in course of erection in Manchester-street, Heywood, on Saturday afternoon, two men named Martin Macnamara and Ashton were killed, and another named Thomas Scanlan was so severely injured that he died soon afterwards. Two other workmen had narrow escapes. At the inquest held on two of the victims on Tuesday, William Houldsworth, foreman mason to the building contractors, Messrs. E. Taylor and Co., of Littleborough, said the accident resulted from Ashton leaving the crane to put a roller straight; that was witness's work, and Ashton had no business with it. The jury returned a verdict of accidental death, adding a recommendation that any work of a like nature should be better manned in future, and that more regard should be paid to the strength of the scaffolding.

Legal.

REAL PROPERTY LIMITATION ACT.

IT has often been too readily assumed that the possession of land or houses for over twenty years, or since 1878 for over twelve years, gave the party having such long possession a legal title to the property, besides preventing anyone else who claimed it from succeeding in an action for its recovery. This is not so, however, although there are cases and judicial dicta which seem to support that idea. Of course, in many cases it comes to much the same thing, for if a person has by such a period of possession obtained such a hold upon the property as that he cannot be ejected, he has become, for all practical purposes, its legal owner, although he could only sell with a possessory title which many would not care to buy. But when the point comes to be applied to a leasehold interest, the difference in the legal effect is soon seen to be very material. This occurred in the recent case of "Tichborne v. Weir" (*Times*, July 22), before the Court of Appeal, and where the cases were gone into and an important decision given.

There the action was for breach of covenant to repair property in Gray's Inn-road, on the Doughty Estate, the plaintiff being ground owner, and the defendant being sued as assignee of a lease which had just terminated. The facts showed that the lease of this house had been granted in 1802 for 99 years, to one Baxter, who about 1836 deposited the lease with one Giraud, by way of equitable mortgage. In 1836 this equitable mortgagee took possession, and so held the property by mere possession until 1876, when he purported to assign the legal estate to the present defendant, who entered, and had since paid his rent to the plaintiff as freeholder. Upon the termination of the lease he was now sued for the cost of repairs under the covenants in the lease. His answer was that he could not be liable, as he was not assignee, and, in fact, had no legal estate in the property, because Giraud, who had purported to assign to him, was only an equitable mortgagee in possession. In short, Baxter, the original lessee, had never assigned the lease to anyone, and so there was no assignee. The plaintiff sought to argue that as Giraud, by his possession over twenty years, had got a good title against all comers, under the Statute of Limitations, the effect of that statute was to make him assignee of the lease by operation of the law, so that he could, and did, legally assign to the defendant. The judge held, and now the Court of Appeal all agreed in holding that the effect of the statute is simply to bar the party out of possession from recovering the land, and not to transfer any title or estate to the party in possession, as has been often supposed. The result was, of course, judgment for the defendant, who, not being assignee of the lease, was not legally liable upon its covenants.

FRED WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning to insure answer same week.

The National Gallery has recently been enriched by four pictures of high value, bequeathed by the Right Hon. Sir Wm. H. Gregory, a late trustee of the Gallery. The subjects of these pictures are "The Adoration of the Shepherds," a large painting by Giam Gerolamo Savoldo, of the Brescian School; an interior, with figures in black and white, by Jan Van Steer, of the Dutch School; "Christ in the House of Martha," by Velasquez; and a sketch of a duel in the Prado by the same painter.

At a Consistory Court held at York Minster on Friday morning faculties were decreed for alterations at St. Stephen's, Eastwood, Rotherham; to the vicar and churchwardens of Bolton-upon-Dearne to remove the seating, and re-seat and refit the church; to the vicar and churchwardens of St. John's, Newland, Hull, to remove gallery, sittings, and internal fittings, and to build new chancel, organ chamber, and vestries; to the vicar and churchwardens of Thorpe Salvin, near Rotherham, to remove western gallery, build new organ chamber, re-hang the bells, remove the floor and refit the church; to the vicar and churchwardens of Greasbrough, to re-seat; and to the vicar and churchwardens of Carnaby, Fraithorpe, to re-seat, re-floor, and refit the chapel.

LEGAL INTELLIGENCE.

ACTIONS BY AN ARCHITECT AGAINST BUILDERS.—Judgment has been issued by Lord Low in two actions. In the first, James Robert Pearson, architect, Edinburgh, sued William Gray, builder, 55, Grove-street, Edinburgh, for payment of the sum of £288 16s. 7d., alleged to be due by the defender for drawing plans and services rendered in connection with the erection of a double villa in Suffolk-road, and two villas in Mortonhall-road, Edinburgh. In the second action the pursuer sued the firm of William Gray and Sons, builders, 55, Grove-street, for payment of £87 7s. 3d., alleged to be due for services rendered to the defenders in connection with certain alterations they were making upon buildings in Morrison-street and Blacket-place, Edinburgh, which included a sum of £37 15s. alleged to have been overpaid to the defenders in connection with the erection of a double villa at the corner of Fountainhall-road and Lauder-road, Edinburgh, belonging to the pursuer. The work at this latter villa was measured up by Mr. Roberts, surveyor, Frederick-street, who reported that the value of the work executed by the defenders amounted to £1,122 5s., and as the defenders had previously received £1,160 on account of that work, the pursuer claimed repayment of £37 15s. In defence to both actions the defenders denied that they were due the sums sued for. The Lord Ordinary has now pronounced a final judgment finding the pursuer entitled to the sum of £50 1s., being the amount decreed for by his lordship in his previous interlocutor, less the sum found due to the defenders under Mr. Belfrage's report; but found the pursuer liable to the defenders in expenses, subject to modification.

IN RE H. TOTEN, SONS, AND YOUNG.—A petition was recently presented by the debtors, who are described as builders of Gloucester-road, South Kensington, and Maude-grove, Fulham-road. The liabilities are stated to amount to about £4,000, with assets £2,000. Mr. Registrar Linklater has made the usual receiving order, and an adjudication of bankruptcy has also been made.

LAW PROCEEDINGS IN THE ISLE OF MAN.—An incident of an extraordinary and amusing description has occurred at Ramsey, in the Isle of Man, as the result of an action brought against the Town Commissioners by Messrs. Holme and King, contractors, of Liverpool. Messrs. Holme and King's action was to recover a large sum of money upon a contract for the sewerage of the Mooragh estate, which had been laid out for ornamental grounds and promenade residences. As the result of the first hearing of the action, the court gave the plaintiffs judgment for £1,020. An appeal took place in regard to a still larger amount which had been claimed; but this resulted in favour of the commissioners. The leading advocate for the plaintiffs (Mr. J. C. Lamothe) is the high sheriff or chief magistrate for the town, and subsequent to the hearing of the appeal he demanded from the town authorities payment of the £1,020, which had stood over since October last. Some delay taking place in regard to the payment, Mr. Lamothe wrote a peremptory note requiring an immediate settlement, and threatening, as an alternative, to issue execution. A summons of this character, of course, had to receive attention, especially in the midst of the fair promise of the tourist season, and the commissioners accordingly paid up the money; but the summary procedure has aroused much angry feeling.

Alterations have been made to the Royal Mint, E., embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

Mr. Hugh S. Cregeen, who has held the office of surveyor to the Bromley local board for upwards of twenty years, having been compelled through continued ill health to resign that appointment, has since been appointed consulting engineer and surveyor to the board at a salary of £150 per annum.

The Duchess of Teck on Wednesday laid the foundation-stone of the north transept and vestry at East Twickenham church. The first section of the church was built some years ago, and the works now inaugurated will bring the erection of the edifice almost to completion. The building has cost £15,250, the present work involving an additional outlay of £2,200, besides which a further sum will be required for a spire.

The foundation stone of a new Catholic Apostolic church, in course of erection in Bath-road, near the Park, at Wolverhampton, was laid on Tuesday. The building will consist of nave 57ft. long and 22ft. wide, and a chancel 40ft. long and 22ft. wide, with organ chamber. A special design of mosaic pavement will be laid in the floor of the altar platform. The church will seat 300 persons. The style is Early Gothic, and the external walls will be erected in red brick, with Hollington stone dressings. Mr. H. W. Rising, of London, is the architect, and Mr. Lovatt, of Wolverhampton, the builder.

WATER SUPPLY AND SANITARY MATTERS.

MIDSOMER NORTON.—Major-General H. D. Crozier, R.E., held a Government inquiry on the 12th ult., with regard to the application of the board for a loan for sewerage purposes and water supply. The chairman of the board, Mr. F. Bird, C.C., explained that the scheme was promoted with a view to prevent an injunction being applied for by the Radstock Board against them, to obviate the nuisance caused by the overflow of the existing sewage tanks into a brook. The system recommended and explained by the engineer, Mr. C. Nicholson Lailey, of Westminster, is that known as the international process of precipitation by ferrous and filtration through polarite beds. Dr. Angell, F.I.C., county analyst, Southampton, was in attendance to describe the chemical action of the process, and in the course of examination stated that the admission of surface water to a reasonable extent, facilitated any process of purification (whether by irrigation or chemical treatment combined with polarite filtration) by reason of the oxygen contained in the water.

TOXTETH PARK.—Major-General Crozier, R.E., and T. W. Thompson, inspectors of the Local Government Board, on the 1st inst. completed an inquiry, at St. George's Hall, Liverpool, regarding an application of the Toxteth Park local board for sanction to borrow £17,400 for destructor works, hospital extensions, sewerage, and other works, from the plans and designs of Mr. John Price, A.M.Inst.C.E., F.S.I., engineer and surveyor to that board. Besides Mr. Price, the following gentlemen gave evidence in favour of the destructor works:—Mr. T. Wainwright, F.S.I., chairman; Mr. H. Hartley, F.R.I.B.A.; Mr. T. de Courcy Meade, M.Inst.C.E., engineer to the Hornsey local board; and Mr. J. A. Brodie, A.M.Inst.C.E., of Liverpool. Mr. Isaac Dixon, M.S.A., surveyor to the Wavertree local board, gave evidence against the proposed site; also Mr. Pain, F.S.I., and Mr. Wylie, for certain adjoining landowners and residents. The inspectors, after visiting the sites of the various works, will report to the Local Government Board in due course.

CHIPS.

It has been decided to re-roof and otherwise restore, and also to decorate, the parish church of Redditch, at an estimated cost of £900.

At Tuesday's meeting of the Glasgow town council the recommendation of a committee that the ground in Garscube-road, where stand the dismantled works of the Phoenix foundry, should be purchased and laid out as an open space, was agreed to. The ground extends to 14,000 square yards, and the price to be offered is 30s. per yard. The scheme implies a capital charge of £22,764 for purchase money.

The bust of William Murdoch, the inventor of gas-lighting, contributed to the Wallace monument at Sterling by the North British Association of Gas Managers, was unveiled on Friday, the 29th ult., by Lord Kelvin. The bust is of marble, and has been executed by Mr. D. W. Stevenson, R.S.A., of Edinburgh.

A fire, doing damage estimated at from £10,000 to £12,000, occurred on Thursday in last week, at the large sawmills of Messrs. W. Nicholson and Son, Hunslet, Leeds. The building in which the fire originated was completely gutted, and for a time 600 men will be thrown idle.

A few days ago a German painter, Julius Huth, passed away who has done much to familiarise the German public with English landscape. Within the past 15 years his pictures were hung in nearly every Continental exhibition, at many of which he carried off medals. Among his best pictures may be named "Cape Wrath, on the north-east coast of Scotland," "Northern Fishermen," "Scarborough, on the English north-east coast" (1884), "Norwegian Coast," and "Fishermen in Storm" (1886). Many unfinished studies of value are left in his studio.

Captain H. B. McCalmont, owner of the Bishop's Wood estate, Ross, Herefordshire, intends building new training stables in the Wye Meadows, near to Bishop's Wood. The work will be under the superintendence of Captain W. Partridge, from plans prepared by Mr. A. H. Pearson, architect, Ross.

The laying of a foundation-stone for a greatly enlarged and more suitable building for the Guildford High School for Girls took place on Thursday, the 28th ult. A site has been acquired at the corner of the London-road and Nightingale-road, close to the London-road Station. The building will be in brick and terracotta. It will comprise an assembly-hall 60ft. by 30ft., five classrooms 18ft. by 22ft. Accommodation will be provided for 150 pupils. Mr. S. Welman, of the firm of Welman and Street, is the architect, and Mr. P. C. May is the contractor.

Our Office Table.

MR. WILLIAM SAUNDERS'S alternative scheme for a new thoroughfare between Holborn and the Strand is a much better and more useful project than the Council Broadway. Instead of ending the road southwards abruptly against the flank of St. Mary-le-Strand, and at an impracticably high level, he proposes to strike a direct line further to the east, at the City instead of the Wellington-street end of the doomed Holywell-street "island." This street would thus end at the open space west of the Law Courts, opposite St. Clement Dane's Church, which would be cleared away. Southwards, the thoroughfare would be extended by way of the much-needed bridge over the Thames, between Waterloo and Blackfriars, to Webber-street, Blackfriars-road; and a northern extension to Euston would complete a street incomparably better and little more costly than the isolated fragment of an improvement advocated by the County Council.

The architects of Philadelphia have published a protest relative to the conduct of the competition for the Bourse about to be built in that city. The building committee proposed to erect a building costing £300,000 sterling, ten stories high, and covering a site 364ft. by 130ft. It issued an invitation to all practising architects of Philadelphia to compete, under excellent terms as to premiums, anonymous signatures, specific drawings, &c., but proposed to pay the successful architect but 2 per cent. on the cost, and to place the superintendence in the hands of an engineer, the architect to be still retained as subordinate to this engineer. To these last two provisions the architects objected, and, meeting together, appointed a committee to conduct the opposition. All attempts failing to have the objectionable clauses removed, a paper was issued, refusing to enter the competition under these terms, which was either signed or verbally approved of by every architect in the city except about six, and including every one of any prominence, and a protest was sent to every member of the profession in most of the large cities in the United States, with a view to informing them as to the merits of the case. The matter then rested, and no decision has been made yet.

MR. R. R. TATLOCK, the city analyst of Glasgow, has conducted a series of experiments for the purpose of ascertaining the best materials, as regards efficiency and economy, for use in the precipitation and treatment of the sewage of the Bridgeton district. In making the experiments, the analyst was also guided by the question whether the consumption for sewage purposes would be likely to affect the common market in which they are sold. As the result of twenty-nine experiments, Mr. Tatlock is forced to the conclusion that, if the necessary efficiency is to be attained, one of the processes based upon the use of sulphate of alumina in conjunction with lime ought to be employed; it would cost about 18s. per million gallons. He also remarks that it is very desirable, if not absolutely necessary, to filter the whole of the effluent. The best materials other than those of gravel and sand would be those employed at Sheffield, such as coke and breeze, which have the advantage of serving as fuel when they are exhausted in the filters.

THE Perth builders had their eighteenth annual excursion on Thursday in last week. At 7.30 about fifty gentlemen started in four brakes from Prince's-street, and drove by Bridge of Earn, Forgandenny, and Invermay to Dunning, where there was a halt for half an hour. On reaching Auchterarder, luncheon was served in the Star Hotel. The party visited Drummond Gardens, where some time was pleasantly spent. Crieff was reached about four o'clock in the afternoon, and dinner was served in Stewart's Hotel. Mr. Beveridge presided, and the croupiers were Councillors Smart and Davidson. After dinner, Mr. T. Craig, of the firm of A. and T. Craig, builders, of Dundee, proposed "Success to the Perth Building Trades," and Mr. J. Ballantine, joiner, acknowledged. Mr. D. Beveridge, in giving "The Architects," said that within the last twenty years there had been a marked improvement in the buildings in Perth. Other toasts followed.

Steps are being taken to raise Castleford, Yorks, from a town under the jurisdiction of the local board to the dignity of an incorporated borough.

Trade News.

WAGES MOVEMENTS.

COLCHESTER.—The recent dispute in the building trade has been amicably settled. The masters have met and decided to grant a rise of a halfpenny per hour on November 1, and also to sign a code of working rules. These terms have been accepted by the men, and the strike, therefore, ended last week.

COLNE AND NELSON.—On Saturday the plasterers at Colne and Nelson, Lancashire, struck work, demanding an advance from 7d. to 8d. The masters offered 7½d. advance.

EALING.—The central committee have sent out notices to the master builders of Ealing district stating that on and after August 8th they should be requested to pay 9½d. per hour (in place of 9d. per hour) to their men, and agree to the code of working rules adopted by the local branch of the society. The masters have been paying 9d. per hour.

LAMBETH.—The strike of bricklayers and labourers against free labour at the Nelson Wharf, Commercial-street, Lambeth, has been settled. A meeting of the strikers was held on Thursday in last week at the Wharf, at which Messrs. Thorne (secretary Gasworkers' Union) and W. Stevenson (Builders' Labourers) were present, and both advised the men to return to work and leave the free labour question to be discussed between the union officials and the employers. After two hours' discussion the majority of the men decided to return to work.

PONTYPRIDD.—The builders' strike at Pontypridd, which has lasted three months, has ended by the masters consenting to pay the men 9d. per hour, and to strike out the clause which the Cardiff masons declare they want struck out in the rules published by the Master Builders' Association. The Cardiff strike has also been ended on similar terms.

CHIPS.

The organ in Fowey parish church was opened on the 28th ult., after reconstruction by Messrs. Hele and Co., of Plymouth.

A memorial window was unveiled in Thornbury parish church on Friday. It represents "Our Lord Blessing Little Children," and the artist is Mr. A. O. Hemming, of Cavendish-square, London.

The 22nd autumn exhibition at the Walker Art Gallery, under the auspices of the Liverpool corporation, will open on Monday, September 5th, and will close on December 17th.

An additional window in the parish church of Kettins, N.B., has been filled in with stained glass by the Hallyburton family. The subject is the "Last Supper," and the work has been executed by Messrs. Ballantine and Gardiner. The window was formally handed over to the church authorities on Saturday last.

Mr. Morris Muleley, builder, of Salford, has been fined forty shillings and costs, inflicted under the Salford Improvement Act of 1870, for allowing six new houses, of which he is the owner, to be occupied without first having them certified as fit for human habitation.

An extensive block has just been added to the Colchester workhouse. Mr. J. W. Start, of that town, was the architect, and Mr. Chambers the builder.

The directors of the St. Julian's Brickworks Company held a meeting at Newport, Mon., last week, at which the tender of Mr. J. T. Morris, of Newport, was accepted for the erection of new engine-house and other works in connection with the development of the company's property. The tender is for £6,000. In addition to this, there will be erected kilns on a new principle, at a cost of about £1,500; and other improvements will bring the total outlay up to nearly £9,500.

At the last meeting of the Hampshire County Council a committee recommended that plans which had been prepared by Sir Arthur Blomfield, A.R.A., and Mr. Robinson (the county surveyor), for the new county offices facing Upper High-street and adjoining Westgate, should be adopted. On the motion of Sir Nelson Rycroft these plans were adopted. The estimate for the new offices is about £8,000.

Mr. A. P. J. Cotterell, Assoc. M.Inst.C.E., of Bristol, has been called in by the Wincanton Rural Sanitary Authority to advise them as to supplying the town of Bruton with water.

On Sunday a baptismal font which has been presented to the Roman Catholic church, Old Goole, was unveiled and blessed. The font is of Caen stone, and is placed on two large steps. The carvings on the panels surrounding the font represent the Seven Sacraments. The work has been executed by Mr. A. H. Wall, of Cheltenham.

Holloway's Pills never cause pain or irritate the most sensitive nerves or most tender bowels. They are the best known purifiers of the blood, the most active promoters of absorption and secretion, whereby all poisonous and obnoxious particles are removed from both solids and fluids.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

TENDERS.

* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BERMONDSEY, S.E.—For dividing the long room in each of two departments in the Alexis-street school into three classrooms, for the London School Board:—

Goad, W. V.	...	£425 0 0
Leeks and Hooker	...	398 0 0
Nightingale, B. E.	...	295 0 0
Charteris, D.	...	280 0 0
Downs, W., Waiworth (accepted)...	...	271 0 0

BETHNAL-GREEN, E.—For the enlargement of the Maidstone-street schools, Bethnal-green, by 798 places, and also for carrying out various improvements in the school, for the London School Board:—

Kilby and Gayford	...	£17,119	...	£263
Clarke and Bracey	...	16,576	...	260
Atherton and Latta	...	16,560	...	261
Longley, J., and Co	...	16,451	...	268
Charteris, D.	...	16,397	...	270
Grover and Son	...	16,310	...	269
Pattinson, S. and W.	...	15,217	...	269
Williams, G. L. S.	...	15,117	...	268
Cox, C., Hackney (accepted)	...	14,742	...	238

A.—If brickwork be built in cement, add.

[(a) Cost of class-room accommodating 793 places, £4,521; (b) class-rooms accommodating 400 places in lieu of two class-rooms converted into a hall on each floor, £2,110; (c) corridors, cloak, and lavatories, £2,111; (d) w.c.s, £440; (e) drainage, £690; (f) boundaries, £212; (g) teachers' rooms, £300; (h) schoolkeeper's house, £1,046; (i) works for existing buildings, £1,960; (j) extra depth of foundation, £1,152; (k) brickwork to be built in cement, £238; total, £14,780. Cost per head of (a) only, £5 13s.; total cost per head of entire school when completed, £8 15s. 5d.]

BROCKLEY, S.E.—For removing three temporary iron buildings from Ivydale-road, Nunhead, and for re-erecting them in Brockley-road, for the London School Board:—

Croggon and Co.	...	£570 0 0
Harbrow, W.	...	491 0 0
Cruwys, T., Camden Town (accepted)	...	450 0 0

BIRMINGHAM—For the erection of two villa residences in the Thornhill-road, Handsworth, for Mr. A. Jones. Mr. Oliver Floyd, architect:—
Grant, H., Selly Oak (accepted) ... £897 0 0

BRISTON, S.W.—For converting the two large rooms in the girls' department of Stockwell-road school into three smaller classrooms by glazed sliding partitions, for the London School Board:—

Goad, W. V. ... £187 0 0
Holloway Bros. ... 140 0 0
Maxwell Bros., Ltd. ... 140 0 0
Garrett, J., and Sons ... 186 0 0
Downs, W., Walworth (accepted) ... 118 10 0

BROMLEY-BY-BOW—For dividing the two large classrooms of the boys' and girls' departments at the Knapp-road school into three smaller rooms, for the London School Board:—

Kilby and Gayford ... £475 0 0
Robey, J. T. ... 472 0 0
Lawrence, E., and Sons ... 495 0 0
Vigor and Co. ... 425 0 0
Calnan, M., and Co., Commercial-road (accepted) ... 352 0 0

CANNOCK—For the supply and fixing of heating apparatus at the West Hill board school:—
Jellyman, S., Cannock (accepted) ... £69 15 0

CANNOCK—For painting the various schools belonging to the school board:—
Benton, J., Hednesford (accepted) £104 2s. 6d.

CLAPHAM, S.W.—For dividing two large classrooms in the Larkhall-lane school, Clapham, into three smaller rooms, for the London School Board:—

Hammond, W. ... £165 0 0
Holloway Bros. ... 158 0 0
Garrett, J., and Son ... 157 0 0
Triggs, E., Clapham (accepted) ... 125 0 0

CLAPHAM, S.W.—For the enlargement of the Haselrigge road School, Clapham, by 372 places, and also for providing a new girls' staircase, cloak-rooms, and five other rooms, for the London School Board:—

Hart Bros. ... £5,420 ... £81
Nightingale, B. E. ... 5,102 ... 95
Lawrence, E., and Sons ... 4,779 ... 70
Holloway Bros. ... 4,556 ... 71
Downs, W. ... 4,506 ... 60
Holliday and Greenwood ... 4,124 ... 66
Co-operative Builders, Ltd., Burton-road, Brixton (accepted) ... 3,836 ... 53

A.—If brickwork be built in cement, add.
[(a) Cost of classrooms accommodating 372 places, £1,571; (b) staircases, cloak-rooms, and corridors for the whole school, £868; (c) teachers' room, £100; (d) technical room, £445; (e) playgrounds and drainage, £130; (f) works to existing buildings, £399; (g) extra depth of foundations, £23; (h) brickwork in cement, £53; total, £3,889. Cost per head of (a) only, £5 0s. 7d.; total cost per head of entire school when completed, £10 15s. 2d.]

DALSTON, E.—For dividing a room in the boys' department of the Wilton-road school, Dalston, by providing a glazed sliding partition, for the London School Board:—
Grover, J., and Son ... £56 0 0
Britton, F. ... 55 0 0
McCormick, T., and Sons, Canonbury-road (accepted) ... 49 10 0

DEPTFORD, S.E.—For erecting a laundry centre and a technical room at the Stanley-street school, Deptford, and also for carrying out various additions and improvements to the school, for the London School Board. Second list of tenders:—

Garrett, J., and Son ... £2,960 ... £50
Dearing, C., and Son ... 2,851 ... 89
Whitehead, L., and Co. ... 2,786 ... 67
McCormick, T., and Sons ... 2,778 ... 67
Willmott, J., and Sons ... 2,669 ... 66
Coxhead, F. J., Leytonstone* ... 2,603 ... 54

A.—If brickwork be built in cement, add.
* Accepted.

[(a) Cost of technical room and laundry centre, £1,503 17s. 6d.; (b) tar-paving and covered playgrounds, £419 11s. 2d.; (c) boundary walls and gates, £315 12s. 2d.; (d) w.c.'s for boys' department, £134 17s. 1d.; (e) works to existing buildings, £133 2s. 1d.; (f) extra depth of foundations, £96; (g) brickwork in cement, £54; total, £2,657.]

EAST DULWICH—For piercing windows in the south wall on the ground and first floors of the Adys-road school, East Dulwich, for the London School Board:—

Goad, W. V. ... £75 0 0
Holloway Bros. ... 66 0 0
Downs, W., Walworth (accepted) ... 49 0 0

EDINBURGH—For causewaying the carriage-way of Dean Bridge, for the city council:—
Brebner, R. C., Edinburgh (accepted) 1,063 1s. 4d.

HANLEY—For the erection of the Wellington schools to accommodate 660 children, for the Hanley School Board:—

Cornes, C., Hanley (accepted) ... £6,400 0 0
[Lowest of nine tenders, the highest being £8,020. Cost per head, £9 13s. 11d.]

HITCHIN—For new buildings for the Hitchin Local Board. Mr. J. Shilcock, architect:—

James... £502 0 0 ... £149 0 0 ... £645 0 0
Barker ... 465 0 0 ... 148 0 0 ... 587 0 0
Seymour & Son 465 6 2 ... 153 16 3 ... 599 9 3
Jeeves, W. ... 469 0 0 ... 137 7 6* ... 533 0 0*
Foster, M. ... 437 10 0* ... 143 0 0 ... 552 0 0
Willmott and Sons—
465 0 0 ... 150 0 0 ... 575 0 0

A.—Engineer's House. **B.**—Boundary Walls. **C.**—Store-houses.
* Accepted. All of Hitchin.

HAMPSTEAD, N.W.—For enlarging the infants' department of the Fleet-road School, Hampstead, by 116 places, and also for carrying out various improvements to the building, for the London School Board:—

Clarke and Brace ... £3,289 ... £80
Lawrance, E., and Sons ... 3,085 ... 53
Nightingale, B. E. ... 2,993 ... 68
Willmott and Sons ... 2,592 ... 59
Williams, G. S. S., and Sons, Barnsbury (accepted) ... 2,595 ... 53

A.—If brickwork be built in cement, add.
[(a) Cost of school and closets, £1,395; (b) tar paving and playgrounds, £223; (c) cookery centre, £638; (d) extra depth of foundations, £39; (e) brickwork in cement, £53 7s.; total, £2,648. Cost per head of (a) £14 12s. 2d.; total cost per head of entire school when completed, £12 8d. 3d.]

HOLBORN, W.C.—For the enlargement of the Prospect-terrace School, Grays Inn-road, by 196 places, and also for providing a playground for the girls' department on the roof of the building, for the London School Board:—

Lawrance, E., and Son ... £1,772 ... £35
Smith, J., and Sons ... 1,642 ... 38
Nightingale, B. E. ... 1,634 ... 46
Patrick, J. and M. ... 1,583 ... 35
Willmott and Sons ... 1,483 ... 52
Coxhead, F. J. ... 1,470 ... 59
Gaze, H. W., Kingston-on-Thames 1,341 ... 33

A.—If brickwork be built in cement, add.
[(a) Cost of school buildings only, £1,247; (b) works to existing buildings, £40; (c) extra depth of foundations, £54; (d) brickwork in cement, £93; total, £1,374. Cost per head of (a) only, £6 7s. 2d.; total cost of entire school when completed, £10 19s. 10d.]

HORRABRIDGE—For new Church of St. John the Baptist, Horrabbidge, Devon. Mr. George H. Fellowes Pryne, F.R.I.B.A., London, architect. Quantities supplied by Mr. R. Henry Hale, F.S.I., London:—

Trevena, W. ... £4,373 ... £4,050 ... £2
Reed and Blight ... 3,732 ... 3,468 ... £237
Berry, J. ... 3,407 ... 3,022 ... 724
Shellabeer, G. ... 3,250 ... — ... 367
Laphorne and Goad... 3,102 ... — ... —
Andrews, A. ... 2,800 ... 2,600 ... 490
Higman, W. H. ... 2,693 ... 2,468 ... 399
Blowey, P. ... 2,589 ... 2,350 ... 298
Fuge, H. B. ... 2,520 ... 2,270* ... 375

A.—Original tenders. **B.**—Revised tenders.
C.—Boundary walls. * Accepted.

INVERKEITHING, N.B.—For carrying out improvements at the waterworks for Inverkeithing and Aberdour:—
Rolland, A., Dunfermline (accepted) £591 18 7

For the supply of valves for same:—
Glenfield Iron Co. (accepted) ... 26 14 0

LIVERPOOL—For alterations in the basement of St. George's Hall, for the city council:—
Hughes and Stirling, Liverpool (accepted) £950.

HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

AND ENGINEERING JOURNAL.

VOL. LXIII.—No. 1962.

FRIDAY, AUGUST 12, 1892.

ROOFS AND ROOF COVERINGS.

IN actual execution the roof, of course, precedes the roof covering; but in working out a design it is frequently the covering which decides the shape of the roof. When once settled, it fixes at least the lower limit for the pitch, and it may even have an influence on the question of hips or gables. In olden times this influence was marked. In many districts hip-tiles were scarcely to be had; lead hips were too costly for common use, and hips made up with slates and mortar were both unsightly and insecure. This difficulty has long since vanished. Facilities for transit are, from one point of view, even too great. Materials can be so readily taken from place to place, that local peculiarities in building are tending to die out. The country, and one might almost say the world, is getting too much alike all over it, and, amongst other things, we now find tile-hips and ridges everywhere. They have, however, usefulness at least to recommend them. They supply a practical want; but this is more than can be said of all the materials which are nowadays becoming fashionable in localities to which they do not belong. Travelling has become easy; but when all places become pretty much alike, what will there be to travel for? It is time that all architects set themselves, as some have long done, to fight against this impending uniformity, and it is worth noting how many roofing materials, and how many ways of using those materials, may still be found within the boundaries of England alone.

One roof covering which is dear to painters, though hardly dignified enough for their architectural brethren, is thatch. The recent destruction by fire of a thatched village in the South of England will not help to commend it, even for cottage roofs, to the practical man. Yet, apart from its pleasant associations and its home-like look, it has merits of its own. Sir Epicure Mammon, in the "Alchemist," when he is scheming to strip the lead from the churches and turn it into gold, proposes to put thatch instead, and remarks, truly enough, that thatch will lie light upon the rafters. And it is not only remarkable for lightness, but for warmth. In the hands of a clever workman all kinds of forms can be produced in it—gables, hips, valleys, and almost everything but gutters. In the Eastern Counties it was brought to great perfection, because reeds were abundant, and were used instead of straw. We need not, indeed, expect to see a general revival of thatching, even in the remotest districts; but it would be a great pity to let the art die out, and the only serious objection, the inflammability of the straw, could in all probability be much lessened by simple means.

The use of oak shingles is almost confined to spires and *flèches*, and there they may be made extremely effective. If well seasoned and selected, they are durable; where there is a proper lightning-conductor they run little risk of taking fire; and in a certain class of work, usually unpretending, though refined, their colour and texture are invaluable. A shingled spire in a freestone county looks, perhaps, a little out of place, though one old example, at least, and by no means a bad one, may be found in Lincolnshire. On a wooden turret, however, shingles form an ideal covering. They enable the feature to be completed in the same material in which it is begun, and there is a charm in unity, although fortunate accidents may

make even patchiness attractive. Shingles, too, from their smallness, are invaluable in giving "scale." The chief objection to them is their cost. This, when the modern contractor is asked to give an estimate for them, turns out to be surprising. Perhaps the reason is that they are so seldom called for. If a country carpenter here and there, in districts where oak is cheap, would make a specialty of these roofs, he might advance his own interests, and they might be less expensive and less exceptional than they now are.

The nearest approach in effect to oak shingles is produced by excessively small and rather thick grey slates, such as still remain on a few old houses at Penzance. The architect who has not seen these houses, or something like them, can hardly imagine how much beauty is to be got out of slating. Here it is used close to the sea, for wall coverings as well as for roof coverings; and so it is also in South Devonshire—as, for instance, at Totnes. The Totnes people were more ambitious in their slating than their Cornish neighbours. They built their walls of a slaty stone, which was liable to let the driving rain through its laminated beds; to prevent this evil, they then covered the walls with slate hanging, and they experimented on this in all sorts of ways. There are slated quoins and slated pilasters, and many other Classic or semi-Classic details, slated over. They look as if a scaly eruption had broken out on the naturally smooth surface of an Italian building, and by degrees had covered it. The result is not always agreeable; but the simpler cottages at Penzance, with their slate hanging, are in this respect quite models for imitation. The artistic objections to slating are its even, mechanical surface, and its want of tone and texture. In Westmoreland green slating these objections are more or less removed. The slates are thick, to begin with. Then they vary in size, diminishing in courses as they rise from the eaves to the ridge. The colour is a pleasant one, and the surface is broken up by the well-marked and somewhat rough edges of the slates. The misfortune is that Westmoreland slates are too expensive for ordinary use. But the old cottages of Devon and Cornwall show us how we may get all the artistic qualities of Westmoreland slating, except its colour, out of some of the commonest and cheapest slates that are anywhere to be had. They are worth looking at a little more closely.

First of all, the size of the slates in general was very small indeed. Next, it often varied in different courses, somewhat as it does in Westmoreland slating. The olden slater took his slates as they came, and they did not come to him all sorted to one size, as they come to his successor of to-day. Neither did he try to reduce them all to the same gauge. He was a man, with such rudiments of artistic talent in him as most men have, or used to have, by nature. He was not a machine, like the typical modern workman, trying to do, by the imperfect aid of hands and arms, things which could be done much better and more regularly by the unerring assistance of wheels and pinions. Hence he put his mind into his slating; he fitted here, and contrived there, and considered how this part would look, and how that part would keep out the weather. Along with his small slates, a few larger ones reached him—as big as "Countess" or even "Duchess" sizes. He did not cut them up to match the others, because he had a use for them elsewhere. If his roof had hips, he worked them in there, one big slate ranging, sometimes with two, sometimes with three, or four, or even five of the smaller courses. If his roof had gables, he worked them into the verges just in the same way, and so he was able to make the verges overhang more, and protect the walls from the weather. Again, where his roof abutted against a wall

or a chimney, he first tilted it up well, to throw the water off, away from the rubble or the masonry. Then he covered the junction with a carefully executed filleting of lime and hair, or mastic, in lieu of lead, and over this he found a place for some of his strongest and most durable slates of medium size. The use of these was to prevent the water, which was sure to run down the masonry in stormy weather, from finding its way into the house through crevices at the back of the plaster filleting. To accomplish this he built them in like steps, each 10in. or 12in. long, and 3in. or 4in. in projection, a little way above the raking line which the roof forms against the wall. As the water ran down the face of the work, it reached these stepped slates, and could not pass them. Consequently it either ran over their edges and on to the roof at a safe distance beyond the filleting, or it just dropped from one projecting slate to the next, until it got down to the eaves. This was the old-fashioned substitute in cottages, and sometimes even in parts of churches, for lead flushings, step flushings, and soakers. It cost less and lasted longer. Compared with the modern slated roofs, which, with other things of their kind, so sicken the townsman of to-day that he has to run away as long and as often as he can, to forget them, these old West-country roofs were full of interest, of art, and of beauty. But we could not get them, or anything like them, by writing a clause in a specification. It takes a man to make them, and a man whose heart is in his work.

The intense ugliness, flatness, and monotony of most modern slating have driven our architects to the use of tiles. Now tiles do have some texture, some solidity, some play of light and shade over them, however mechanically they may be laid. With plain tiles the courses cannot be much more than 4in. wide, and so the "scale" of a building does not suffer by them as it does by slates of the sizes now customary. Plain tiles, too, are not absolutely flat, and their slight curvature gives variety of tone and softness of effect. In Hampshire one sometimes sees tiled roofs, perhaps to mere sheds and out-houses, which seem to have the softness and richness of velvet, even when new. Broseley tiles and others of that class look hard when first laid, and turn black, rather than greenish or brownish, by time. Tiles of a different make or of a different tint mixed at random amongst them help to prevent the deadness which comes over such surfaces. But the difficulty is to get them mixed at random. The modern slater would rather make them into patterns, or into bands, or into something else that is loud and staring. He cannot appreciate the beauty of a quietly and delicately diversified surface, and if he is not allowed to do worse, he is likely at the least to put into one mass all the tiles which you are introducing to get a little play of colour, so that he can go on with his even, mechanical task, and rejoice at having got rid of them. There are places, of course, where patterns may be welcomed. Here, in England, we seldom find them in such places; though we see them often where they would be far better away. But some of the French churches show what can be done, when that sort of doing is desirable, with both unglazed and glazed tiles of the richest colours.

Ornamental ridge-tiles are dear to the speculative builder. Like tile patterns, there is a right place for them; but that place is not where he puts them. Fortunately, they make admirable marks for stone-throwing, and it is a merit in the street-boy, which ought to hide a multitude of his sins, that he does his best to relieve us of these excrescences. Some five-and-twenty years ago quite a crop of patent tiles sprang up. They were on the pantile system, or on various modifications of it, and some of them were clever; but the weak point in all of

these was that the roof covering was only one tile thick, so that if there was a crack or a flaw in any tile the water came through at once. For the same reason, roofs covered with them were very liable to injury by workmen, and the result is not only that they are little used in new buildings, but that they have even been removed from older ones. Roman tiles, which have a separate covering piece over the vertical joints, are stronger, and less liable to injury; but English architects have found it difficult to get them properly made. And all these specimens of the pantile type have such a marked and distinctive character of their own, that they either jar with or overpower most architectural details.

We have no room to speak of lead as a roof covering. It has a beauty of its own, though in London the smoke and soot seldom let us see it. But the grey roofs of Lincoln are something to remember, and so is a quaint, old, lead-covered spire like that at Braunton, near Ilfracombe. Bleached in places almost silver-white, covered with rolls and fragments of rolls, patched up with patterns and ends of patterns, old and new, it looks like a history of North Devonshire plumbers for many generations. But their patching was surely not without expense; and in the quantity of it which has been needed we may see the reason why lead-covered spires are as infrequent as they are.

THE BISHOPSGATE INSTITUTE COMPETITION.

SIX competitive designs for the institute to be erected in Bishopsgate-street, on a scheme of the Charity Commissioners for St. Botolph Without, have been exhibited in Spital-square. The site selected is bounded on the north by Brushfield-street, on the east by Duke-street, and on the west by Bishopsgate-street, and presents a particularly irregular plot, its main length being east and west surrounded by frontage properties. Three entrances are available from the streets named, those from Bishopsgate and Brushfield streets being very narrow, and the former not at right angles to the main block, which has necessitated a rather awkward bend at the junction of the chief entrance with the main building. The design selected by Mr. MacVicar Anderson, the assessor, under the motto "Arts and Letters," is by Mr. Charles Harrison Townsend, F.R.I.B.A., who arranges the main hall, reference and lending library blocks within the irregular boundaries, and as nearly as practicable on an axis parallel to Brushfield-street. A wide entrance corridor from Bishopsgate-street gives access to the large hall about 80ft. by 47ft., with a platform recess opposite the entrance, and cloak and ante rooms on the right-hand side; to the left a wide corridor, 14ft. wide in part, returns and runs lengthwise with the hall on the Brushfield-street side, with two doorways into the hall at the side. Access to this side corridor from the entrance in Brushfield-street will also give an additional entrance to the hall. The same corridor is continued to Duke street, where there is a third entrance and staircase. Close to this entrance is the lobby for borrowers. This department is disconnected from the hall by a cross passage. The lending and reference libraries, separated by a librarian's room, are lighted by windows towards Duke-street, and from the back or south area, and the main side corridor is top-lighted by skylights and circular lanterns in the ceiling. The first-floor plan gives a newsroom, with girls' room at the Duke-street end, a reading and magazine room and room for boys attached, well lighted mainly by windows, and at the Bishopsgate-street end a board-room over the main entrance, with convenient cloakrooms and clerks' office attached. The caretaker's rooms are over the Brushfield-

street entrance. The large hall is lighted by a series of upper windows on both sides of roof; a hammer-beam type of construction is shown, with arched ceiling between the queen-posts. The elevation to Bishopsgate-street is of Renaissance design, with a circular archway to entrance, above which is a mullioned window between octagonal projections carried up and crowned with steep spirelets. There is a balcony formed between these octagons over the arched entrance, and the elevation has a steep, hipped roof, the features agreeing well with the characteristic architecture of this old thoroughfare. The Duke-street front is of plain brick character, while that towards Brushfield-street is gabled, with archways forming the side entrance to hall. These elevations are artistically treated, and the detail is fairly good. The basement plan illustrates the course of heating trunks and drains. The stairs are well arranged for convenience to the board-room and hall, and the library and hall departments are separated. "St. Botolph" shows some clever planning; the blocks are aligned in parallel lines, but the public hall is placed at the Duke-street end, with platform recesses towards the street, and is divided by a row of pillars which carry side galleries, also the main arched ceiling and hall, thus forming above the galleries lean-to roofs with lunette clerestory lights. The hall is approached direct from Duke-street and Brushfield-street; the latter entrance gives access to a vestibule between the hall and lending library. The reading-room for 300 persons, and reference-room for 52 persons, are aligned end to end on the south side, a corridor from Bishopsgate-street running between the lending-room and reading-room, and giving access to the latter, and also to the borrowers' lobby at the left-hand corner. The reference-room and reading-room are top lighted. On the first floor we have the gallery round hall, mainly top-lighted; rooms on each side of platform recess for refreshments, a book-case gallery over reference library and one round the lending library, also top lighted, a board-room in front over entrance, with office. Skylights are shown on each side of lending library, over corridor, and side area. The elevation in Bishopsgate-street is in the Renaissance style, two arched entrances and a gabled termination. The other elevations are plain. In this design the author claims direct light to all roofs which have double skylights, while extract ventilators are shown to all of them. The librarian has a room corbelled out at corner of reading-room, which enables him to supervise the leading departments on the first-floor level.

"Justitia" is clever in its blocking of departments, which are arranged in parallel lines. An entrance corridor from Bishopsgate-street leads to a lending library, 50ft. by 28ft., on left of corridor, with lobby, a reference library, and librarian's room on right of corridor. A cross hall from entrance in Brushfield-street separates the library from the hall, which latter is placed flanking that side with corridor between it and the newsroom on south side. The hall has a circular platform recess at the east end, and is 67ft. by 37ft., exclusive of platform. The newsroom is 66ft. by 30ft., is irregular, and shows iron columns supporting the outer walls above, cutting off the irregularity of site. The defect of the plan is the want of separation between the hall and library department, or newsroom. The corridors are top-lighted, and the hall is lighted by three domical lanterns and circular windows along the springing of elliptical vault. It has an iron roof. The roof plan shows the skylights, which are numerous. The elevations have scarcely any distinctive character. "Progress" is distinguished by neatly-drawn ink elevations of some refinement. The hall, 83ft. 6in. by 49ft., is at the Bishopsgate-

street end, with central vestibule and a corridor approach on each side of hall. The reading-room is at the Duke-street end, and is entered from side corridor and lobby entrance in latter street; but we do not like the shape of this room nor the columns which carry the upper walls. The hall is lighted by glazed panels in the ceiling, and by an upper tier of windows. The library is lighted at top and side, and on the whole the lighting is good. "Postage Stamp" has the hall approached from Bishopsgate-street, a large crush-room intervening. A long side corridor extends along the Brushfield-street side, skirting hall, with side entrance. Next follows the lending library, with borrowers' lobby and a reference library at Duke-street end, all entered from side corridor and side-lighted. The entrances are cleverly planned; there is clerestory lighting round the hall. The newsroom is over the library, and has skylights. The corridors are top-lighted, with side windows at areas. A want of character marks the elevations, which have Italian features. Large details of hall and ceilings are sent in with this well-drawn set. "Plan" has three distinct blocks separated by corridors; the library is placed at the Duke-street end of site, and is irregular. The public hall is central, 48ft. by 65ft., with platform on the south side; next is the reading-room, also square, 59ft. by 55ft. The hall is lighted by a circular lantern in centre. The elevations show gabled fronts of an elaborate design towards the main entrances. The scheme has at least the merit of separation between the buildings and of good lighting, a point which the competitors had to keep in view, owing to the contiguous premises requiring the rights of light to be preserved. In this respect the author of the selected design appears to have succeeded in satisfying the conditions. The contracted frontages towards two of the principal streets are unfortunate, and prevent the attainment of an architectural exterior worthy of the object and the locality—a consideration that can only be realised by the purchase of the main frontages towards Bishopsgate-street and Brushfield-street.

THE BRITISH ASSOCIATION AT EDINBURGH.

THE exciting proceedings in progress at Westminster have tended to rob the sixty-second congress of the British Association, held during the past ten days at Edinburgh, of much of its popular interest, while the papers themselves have not, as a whole, been up to the old Association standard. We published last week (p. 196) a summary of the lucid and picturesque address by the President, Sir Archibald Geikie, and propose to follow this up, as in previous years, with abstracts of a few of the papers specially attractive to our readers. Those desirous of more full reports may be referred to the last and current issues of the *English Mechanic and World of Science*.

THE DEVELOPMENT OF COAST LINES.

Professor James Geikie devoted his opening address, as President of the Geographical Section, to a consideration of the geographical development of coast lines. He dealt, in turn, with the coast-lines of the Atlantic and of the Pacific, and with the Arctic and Antarctic coast-lines of North America, and, summing up, he said they arrived at the general conclusion that the coast-lines of the globe were of very unequal age.

THE WINDINGS OF RIVERS.

Mr. J. Y. Buchanan, Edinburgh, in a paper on "The Winding of Rivers," pointed out that there was a family likeness between all rivers in regard to their windings, and apart altogether from their size. In the case of such a river as the Rhine, which for the greater part of its course ran through a broad valley, there was no external obstacle to the bends taking a larger form, and the reason why the bends did not take that larger form, but remained as they were, was

found in the mechanical laws of the motion of water. The windings of rivers he explained on the basis of the harmonic curve.

CIRCULATION OF UNDERGROUND WATERS.

Mr. E. De Rance gave in the report of the committee on the circulation of underground waters, and exhibited a map which is being prepared by the secretary of the committee for Mr. Brunner, M.P., showing how the rivers interweave with the county boundaries. The map is for presentation to the county councils and county boroughs of England and Wales, to aid in the formation of joint boards for the control and prevention of pollution of the rivers of the country.

THE TRIUMPHS AND PROSPECTS OF ENGINEERING SCIENCE.

Professor W. Cawthorne Unwin, the President of the Mechanical Science Section, recounted in his opening address some of the recent triumphs of the science and speculated as to its prospects in the immediate future. The year just passed was not, he thought, one unmemorable in the annals of engineering. By an effort remarkable for its rapidity, and as an example of organisation of labour, the broad-gauge system had been extinguished. It had disappeared like some prehistoric mammoth, a large-limbed organism, perfect for its purpose, and created in a generous mood, but conquered in the struggle for existence by smaller but more active rivals. The past year had also seen the completion of the magnificent scheme of water supply for Liverpool from the Vyrnwy, carried out from 1879 to 1885 by Mr. T. Hawksley and Mr. G. F. Deacon, and since then completed under the direction of the latter engineer. He next discussed some of the causes which had made the steam-engine inefficient, and the extent to which they were getting to a scientific knowledge of the methods of evading them. The history of steam-engine improvement for a quarter of a century has been an attempt to secure the advantages of high pressures and high ratios of expansion. It became clear from Hirn's experiments that for each engine there was a particular ratio of expansion for which the steam expenditure per horse-power was least. Professor Dery had since deduced from them that the practical condition of securing the greatest efficiency was that the steam at release should be nearly dry. The whole tendency of the conditions created by the use of steam-power had been to concentrate the industrial population in large communities, and to restrict manufacturing operations to large factories. The whole social conditions of manufacturing centres had been profoundly influenced by these two conditions—that coal for raising steam could be easily brought to any place where it was wanted, and that steam-power was more cheaply produced on a large scale than on a small scale. It looked just now as if facilities for distributing power would to some extent reverse that tendency. Just as in great towns it had become necessary to supersede private means of water supply by a municipal supply; just as it had proved convenient to distribute coal gas for lighting and heating, and to provide a common system of sewerage, so it would probably be found convenient to have in all towns some means of obtaining mechanical power in any desired quantity at a price proportionate to the quantity used, and in a form in which it could be rendered available either directly or by simple motors requiring but little skilled superintendence. He then addressed a few words as to modes of distributing power. Electrical power distribution had not yet made so much progress as might have been expected. Few persons could have seen Niagara Falls without reflecting on the enormous energy which was there continually expended, and for any useful purpose wasted. The exceptional constancy of the volume of flow, the invariability of the levels, the depth of the plunge over the escarpment, the solid character of the rocks, all marked out Niagara as an ideally perfect water-power station, while, on the other hand, the remarkable facilities of transport, both by steam navigation on the lakes and by four systems of railways, afforded commercial advantages of the highest importance. The whole steam utilised would supply 7,000,000 H.P. That was more than double the total steam and water power at present employed in manufacturing industry in the United States. The idea of a method of

utilising the Falls, capable of greater development, and free from the objections to the hydraulic canal, with mills discharging tail water on the face of the cliff, was due to the late Thomas Evershed, division engineer of the New York State Canals. He proposed to construct head race canals on unoccupied land some two miles above the Falls. From these the water was to fall through vertical turbine pits into tail-race tunnels, converging into a great main tunnel, discharging into the lower river. Apart from an inappreciable diminution of the volume of flow over the Falls, this plan avoided any disfigurement of the scenery near the Falls, and permitted a head of nearly 200ft. to be made available. It was, however, essential to such a plan that work should be undertaken on a very large scale. The present plans contemplated the utilisation of 100,000 effective horse-power, and Niagara was likely to become not only the seat of large manufacturing operations of familiar types, but also the home of important new industries.

ELECTRIC LIGHTING AND REFUSE DESTRUCTORS.

Professor Forbes made a communication on the "Application of Destructors, especially to the electric lighting of Edinburgh." He said his object was to enable the citizens of Edinburgh to see the enormous natural advantages which existed in the city and their relation to electric lighting. These advantages would enable them to obtain electric light at a price cheaper than gas, a thing that had not been possible in any town. His subject was divided into two heads. First he had to speak about the use of destructors for burning the city ash-bin refuse, and the means of using these destructors for generating steam so as to apply it directly to the generation of electricity for lighting. The natural advantages of Edinburgh enabled it to overcome one of the most serious causes of the high price of electricity in other central stations. The reason why Edinburgh was peculiarly well situated was that it had very high land in the immediate neighbourhood of the town. At the summit of Arthur Seat there was a gully looking down in the direction of Portobello, which, by means of a very short dam, enabled them to make a reservoir, which would not be the least unsightly in the neighbourhood of Edinburgh, which would be invisible in all directions from which Arthur Seat was such a magnificent object, and which could only be seen from the direction of Portobello. After that a pipe line could be taken down to Lochend—nearly a mile distant. The height of the reservoir would be 725ft.; that of Lochend was 83ft. By building a dam near the summit of Arthur Seat they could get a reservoir to a height above Lochend of 605ft., and the content of the reservoir was approximately two million cubic feet, which meant 28,000 horse-power hours on the assumption of 75 per cent. efficiency in the turbines and pipes. The cost of the pipes gave about £1 per horse-power. They could obtain a maximum output from the 28,000 horse-power in the central station of 12,500 horse-power. The use of destructors for getting rid of refuse and getting up steam for electric lighting purposes would play an important part in the future. In Edinburgh they would be able to use destructors with the utmost advantage, as the difficulty regarding hydraulic storage was done away with.

FILTRATION OF SEWAGE.

Mr. Richard F. Grantham, in a paper entitled the "Absorption and Filtration of Sewage on Sandy and other Soils," described the example of sewage irrigation in Edinburgh, Dantsic, and Berlin, and the effect on the sandy soil in each case.

FLEXIBLE METALLIC TUBING.

Mr. Gilbert R. Redgrave described flexible metallic tubing, invented by M. Levavasseur. In the tubes made it became possible to omit the rubber, and to obtain a perfectly tight joint between the metal surfaces. Figures were submitted showing the strength of various tubes, and an account given of the industrial applications of flexible tubing.

THE MERSEY AQUEDUCT TUNNEL.

Mr. G. F. Deacon, in a paper entitled "Shield Tunnelling in Loose Ground under Water-Pressure," gave an account of the tunnel recently completed under the river Mersey for connecting the Lancashire and Cheshire portions of the Vyrnwy aqueduct. The operations occu-

pled 47 months. He sketched the history of the movement, and narrated the difficulties encountered in carrying out the work. A shield might be constructed in any particular case to meet all the contingencies that could arise; but it was from works like the Vyrnwy aqueduct tunnel under the Mersey, in which the means of meeting difficulties were not sufficiently provided, and where success was nevertheless attained, that the most valuable lessons were to be learnt.

DESIDERATA IN PHYSICAL LABORATORIES.

Professor Schoute, of Groningen, gave a description of the physical laboratory there, which had been built with a view to carrying out researches in the most accurate manner possible. The chief points aimed at were: (1) The elimination of disturbances from traffic, (2) that the free access of sunlight on all sides should not be obstructed; (3) that the foundation should be firm, but without transmitting vibration; and (4) that the presence of any iron in the building should be avoided.

SOIL-PIPES AS LIGHTNING CONDUCTORS.

Mr. W. H. Preece called attention to a new danger in the destruction of lightning protectors by recent municipal legislation. He said that the immunity of private houses from being struck by lightning is very marked, and this is considered to be due to the fact that the lead on our roofs and the iron stack-pipes that drain these roofs, connected as they are together, form admirable lightning protectors. Any charge of atmospheric electricity which may fall upon a house so protected is conveyed harmlessly away to the earth. Householders are now required to remove these pipes from direct connection with the drains, and to leave an air space between the end of the pipe and the grating of the drain. The result is that the electric conduction of the pipe is broken, the stack-pipe ceases to be a lightning protector, and houses are left exposed to the danger of atmospheric electricity. The remedy is very simple. The pipe need not be entirely cut away. Three-fourths of its circular section may be removed for the distance required, and one-fourth may be left to maintain the old electrical connection; or, if the separation has been effected, then the stack-pipe should be connected with the drain by a wire or rod, so as to restore a path for the charge to the earth. Householders are also now compelled to put up stack-pipes to ventilate their soil-pipes, erecting above their roofs a metal tube forming a prominent object exposed to the atmospheric charge, and terminating frequently in an earthenware pipe on the first floor. They are thus liable to be struck by lightning without offering any means of escape. The tubes should be connected electrically with the earth, either directly or indirectly through the stack-pipes, which would then make them sources of safety rather than of danger.

THE IMPURITIES OF TOWN AIR

was the subject of a paper by Dr. G. H. Bailey, read in the Chemical Science section. During the past twelve months the Air Analysis Committee of Manchester, in conjunction with the Royal Horticultural Society, has been engaged on the analysis of the air of large towns. A large amount of information having been already collected by previous observers as to the carbonic acid in the air, it was thought desirable to devote more special attention to such impurities as sulphurous acid and organic matter. Furthermore, since the object in view was not merely to collect data, but to lay the foundations of what may be termed chemical meteorology, the atmospheric conditions prevailing at the time of the observation have been noted. From the results of several hundreds of analyses carefully conducted in London, Manchester, and Liverpool, the following conclusions are drawn:—1. That in clear, breezy weather, the amount of sulphurous acid is less than one milligramme per 100c.ft. of air. 2. That in anticyclonic periods it rises very considerably, and in times of fog maxima of 34 and 50 milligrammes have been recorded for the worst districts of Manchester and London respectively. 3. That wherever an open space or a less densely-populated area occurs there is a very marked diminution in the amount of impurities in the air. 4. That an increase in the amount of sulphurous acid is accompanied by at least as large an increase in the amount of organic impurities in the air. 5. That smoke, promoting as it does the formation

of fog, and preventing freediffusion into the upper stratum of the air, must be regarded as the principal cause of the impure state of the atmosphere in large towns.

THE TAXATION OF BUILDING LAND.

A paper by Mr. Mark Davidson, "On the Taxation of Building Land," dealt with three proposals—(1) the taxation of ground rents; (2) assessment of unoccupied land capable of yielding ground rent; (3) acquisition by the community of the unearned increment of land. He said that as to the first the question is one of assessment, and especially the method of assessment adopted. The rent of ground already pays rates equally with the rent of houses. To tax it additionally would be to alter the principle on which rating proceeds, and would tax lands of identical values at different rates. On the other hand, the second proposal is in keeping with the system of local rating adopted for vacant land, which, being exempted from rating, is treated differently from other real property. The third proposal is the most complex, because it is not a matter of taxation, but of the acquisition of property; and the difficulty of the problem consists in the fact that it is desired to appropriate real property without assuming the right to administer it.

REPORT ON GRAPHIC METHODS.

Prof. H. S. Hele-Shaw, University College, Liverpool, submitted an abstract of a second report on the "Development of Graphic Methods in Mechanical Science." He pointed out that there was scarcely a treatise or publication dealing with mechanical science that did not employ some kind of graphical expression as a means of exposition or calculation. Graphic methods really included every way of representing numerical quantities by means of drawing, except the representation of actual bodies and purely geometrical construction. A study of the list of references to graphic applications in scientific literature of this country appended to the report showed that gradually, but with an ever-increasing rate, it had become the custom to employ representations of numerical results graphically, and to suggest and use the solutions of various problems by graphic methods. These two purposes: (1) Representation of results by means of plotted curves and autographic diagrams; and (2) solution of problems by graphical methods, seemed to suggest a satisfactory way of dealing with the subject. The difficulty of ascertaining what subjects in mechanical engineering had been treated graphically in current literature was very great. Nothing less than an examination of every page of engineering journals and scientific papers sufficed for the purpose, since no intimation was usually given in the index. The scheme of the report was described under four headings: First, geometrical considerations involved in the representation of results graphically, and in graphical calculations; second, the representation of results; third, graphical solution of problems; and fourth, classified list of reference to graphical methods.

Next year's meeting of the British Association will be held at Nottingham, and Dr. Burdon Sanderson will deliver his presidential address on Wednesday, September 13. Oxford has been selected as the meeting place for 1894.

THE ARCHITECTURAL ASSOCIATION EXCURSION.—I.

[WITH ILLUSTRATIONS.]

ON Monday next this annual excursion will commence proceedings from Taunton, where the London Hotel is to make the headquarters of the party. We printed an outline of the programme on the last Friday in July, and by way of a prospective description, we intend to-day to give some few particulars of the district, concluding with a description of Dunster, with its church, castle, and old houses. Both the Quantocks and the range of the Brendon Hills are, of course, beyond the limits of Exmoor, with its wild uncultivated grandeur and lonely charms; but the irregular line of the Quantocks, rising away towards the sea north-west of Taunton, with their breezy slopes bare or partly covered with trees, comprise scenery of a kind second to none on Exmoor itself, and far superior to the tamer delights of the Brendons—"Hilles that renne in crestes from Quantok-hedde towards Tauntown," and are almost now as wild as when Leland thus

described them in his "Itinerary." The crown of the westernmost heights of the Brendons assumes an almost dead level belt of unbroken heather-land, which becomes monotonous when seen for miles over the wooded slopes and graceful combs on either side, at once lacking the wild magnificence so peculiar to Exmoor. These hills are Devonian in formation, and the new red sandstone of the lowlands is remarkable as a fertiliser, where farms are famous for prosperity. This stone, known as Keuper, was largely used for building, as at St. Mary's, Taunton. Between the Quantocks on the east and the borders of Devonshire on the west, there must be at least, according to the best authorities, no less than thirty old manor houses erected during the days of the Tudors now used as farmhouses. Many of these old manorial homes have chapels or oratories in situ still. Lower Marsh, near Dunster, is a specimen, with its little prayer-closet over the porch, a veritable Mediæval dwelling. Between Minehead and Stower, running some fourteen miles alongside of the Bristol Channel, there are twenty-two more such houses still remaining. A great feature in the larger number of them is the elaborate plasterwork both to fireplaces and ceilings, and even in cottages, which never at any time seem to have been other than very small dwellings, some of the most exquisite specimens of this kind of work are to be found. Thus at Stamford Brett there is a beautiful ceiling in a cottage well worthy of a more ambitious building. Timber was freely employed for arched doorheads and the tracery of windows, and, like the screen work and bench ends throughout Somerset, is detailed often in the most elaborate and admirable manner. The Tannery at Minehead, Bratton Court Farm, and a cottage at Lynch, near Porlock, are capital examples of this use of timber. West Somerset boasted of three religious houses—namely, the Cistercian Abbey of St. Mary of Cleve, and the Priors of Barlynch, near Dulverton, and Dunster. The greater part of the first named exists, consisting of a refectory of exquisite design, a dormitory, common room, chapter-house, cloisters, and offices. These will be seen on Tuesday, and illustrated by us next week. Barlynch was a small Augustinian foundation, instituted by William de Say in the 12th century, but only two crumbling walls are now standing. Dunster possesses nothing more than the priory barn and dovecote. The churches are famous throughout the county for their Late, and sometimes "Flat," detail characteristic of the Perpendicular period, which in this immediate district is scarcely so rich in the detail of stonework as in other parts of Somerset. Bishop's Lydeard has, however, one of the grandest towers in the county, and, of course, St. Mary's at Taunton is among the most celebrated in England, rising as it does 153ft. to the parapet, and elaborated to a degree. Wrington tower ranks perhaps the finest in Somerset, then that of St. Cuthbert at Wells, after which comes St. John's, Glastonbury. Evercreech, Cheddar, and Huish Episcopi have all remarkable towers, and so has Middlezoy, which is of another type. That of St. Mary's at Taunton is wanting in the graceful proportions and harmony of scale which mark the designs of its peers. The overbearing dimensions of the pinnacles on the cresting, needlessly elongating the almost detached lantern, give a top-heavy appearance, which is more conspicuous when seen on the angle than in direct elevation. The base hardly spreads sufficiently to indicate a spire-like growth, so essential to good effect, while lateral breadth is lost by the introduction of double windows to the three upper stages. Inside the church is very handsome, the double row of columns to the nave arcade being unusual and effective. The screens, pulpit, and organ-loft deserve mention.

Turning now to Dunster, the excursionists will see, adjoining the very scanty remains which still exist of the once famous Benedictine Priory of "Dunestora," the spacious and beautiful parish church of St. George, which, until 1499, was used in common both by the people as well as by the monks. The Abbot of Glastonbury was at that time called over to arbitrate between the two factions, who had for a long while contested the right of equal use of the building. The decision thus arrived at here, as elsewhere, was that the parish altar in future should stand west of the rood screen, under the western arch of the central tower, leaving the choir and transepts for the clergy. The monks soon had to give way, how-

ever, for the Dissolution, conducted on what we nowadays should call the Progressivist policy, soon set the cowed worthies to the rightabout, and "the hole church of the late Priory serveth now for the parochie churche—afore tymes the monkes had the est parte closed up to their use." Subsequently to Leland's time, when he thus wrote of the place, the church became greatly neglected, and in fact was closed entirely for a long time. A few years ago the building was, however, renovated and restored by the late Mr. G. E. Street, R.A. The chancel, long used as a private chapel of the Luttrells, is of Early English character, with simple lancets, but the rest of the church is mainly of the Perpendicular period, with embattled walls to the nave and south porch. The tower, which rises to a height of 90ft., contains some good bells, and on the wall the "Articles of Ringing" are intended as a corrected list of punishments reserved for contumacious bellringers, whose fines for the most part were stipulated to be expended "in cyder or in beer." Inside the church there are some tombs, the principal one being the canopied altar monument to Sir Hugh Luttrell and his lady, who died respectively in 1428 and 1433. This tomb in general character bears some resemblance to the Harrington Monument in Porlock Church. The curious archway between the south transept and the choir, herewith illustrated to-day, exhibits one of those curious alterations, if not original bangles in buildings, sometimes found in specimens of old work. The general explanation is that the archway was increased in width during the 15th century, and the corbels were inserted at the springing of the earlier arch as we now see. The dark oak screen is interesting, as is also the chantry with its altar stones, and the Decorated canopy, too, over the effigy of the Everard lady, whose remains rest against the south wall of the presbytery. The font, sculptured with the emblems of the Passion and the five sacred wounds, deserves mention, and in the churchyard stands the stump of a 13th-century cross. In Church-street, on the way to the castle, is an old plastered and timbered dwelling, once the home of the priest, but now occupied by the vergers. "The Nunnery," further down the road, bears a more decidedly ecclesiastical and picturesque appearance, with the tiled penticies which divide the stories of the building, and enhance its antique effect, surmounted as it is with lofty gables and steep roofs. The name given to the house is seemingly quite recent, and even within the present century the "High House" was the common appellation. Now it is divided into cottages, but formerly was known as "The Tenement of St. Laurence," from the fact that the revenue of the chantry of St. Laurence was derived from the property. Although the fancy kerseymeres once known as "Dunsters," long enough ago ceased to be fabricated here, the old, quaint Yarn Market-house, still standing in the midst of the main street, serves to remind the passer-by of the days of James I., for the building dates from 1609, and at that time an Act of Parliament refers to the cloths just alluded to, which were then as famous as the worsteds in Norfolk. One of the massive angle posts of this old building, too, bears the unmistakable mark of one of Blake's cannon balls in connection with the historic incidents of 1646. The Abbots of Cleve once resided hard by in the old tavern, which possesses a porch of 15th-century date, and has the credit of belonging long ago to the beforementioned priory, founded by the Mohuns soon after the Conquest. The "Luttrell Arms" anyway, is a very old house, with indications of the original chapel still discoverable, while at the rear of the premises the earthworks of the Roundheads remain to tell the tale of their siege of the castle under Blake. Upstairs the oaken gabled room has some features of more than ordinary interest, and in another apartment the typical plaster chimneypiece has figures in Elizabethan dress, as well as a coarsely-modelled nude form represented attacked by hounds, and commonly thought to impersonate Actæon. Some have considered that the composition had its origin in the character of Lazarus undergoing the attention of the dogs, who had more mercy than their master. The castle, now known as the princely home of Mr. Luttrell, incorporates all that remains of the masterful stronghold originally erected by William De Moion, great baron of the Cotentin, who received the manor with sixty-

seven others in the West of England, from William the Norman. One of this same family of Mohuns, as they came to be called, held the castle against Stephen. The present owners bought the estate in 1376, on the death of John de Mohun, the eighth baron. The lady who thus acquired the property was Elizabeth, daughter of Hugh Courtenay, Earl of Devon, and widow first of Sir John de Vere, and afterwards of Sir Andrew Luttrell, of Chilton, a cadet of the Barons Luttrell, of Irnham. She was, too, of Royal descent, and related to Edward III., and, moreover, had great wealth. Her son built, most likely, the great gate-house. The Luttrells shared their influence with the Lancastrians; but during the wars between Charles and the Parliament the family sided really with neither party, and were out of favour consequently with both. In 1643 the Royalists took possession, and Charles had a chamber for his own use in the house. Three years later Blake's attack, which we have already spoken of, took place, and a few iron cannon balls, memorials of this siege, have been preserved. Sir Francis Wyndham, who was in command of the Royalists, surrendered the castle on the 19th of April, 1846, after holding out for six months. Alterations of the buildings from time to time have been made, but generally so with a view of material improvement to the place, such, for example, as the raising the surface in the lower ward to probably 14ft., with earth obtained by scarping the adjacent slope of the tor. This involved the closing up of the old gateway, and no doubt was combined with the construction of the new approach, which passed below and outside the gate-house, wound round the castle and the tor, and entered the lower ward at the new level. The keep was probably either circular or polygonal, and, like Lincoln, was approached by a direct flight of steps from the lower ward. The gateway, which belongs to the days of Henry III., has recently been restored as far as may be, and gives access by steps to the lower ward. The great gate-house still remains perfect, and makes an appropriate entrance to the mansion. It was erected, perhaps, by Henry Stone, in Henry V.'s reign. The principal, or second floor, has lately been converted into a handsome hall with an open roof. The summit is embattled, and at the four angles are turrets. The Luttrell arms rule everywhere. When Mr. George Luttrell came into possession of the property in 1864, he enlarged the Elizabethan mansion and added a new tower to the west front from the designs of Salvin. The fine hall and staircase of the house are rich in carving, and grand plaster ceilings exist in both, dated 1681. The plaster chimney-pieces in some of the rooms are of the curious kind found at East Quantock Head House, and in very many old residences, both large and small, throughout the district. The Italian painted leather hangings in one of the rooms, representing the diversions of Antony and Cleopatra, are unusual, and generally are known erroneously as "tapestries" in local descriptions. The paintings in the house include Vandyck's famous portrait of Cromwell, some Opies, pictures by Sir Joshua Reynolds, and others. The present south front was built about 100 years ago. The view towards the sea includes the park, which extends from Minehead to below Chrampton. Inland the prospect is one of exceeding richness, limited and sheltered on the south and west by the graceful table-tops of the Brendon Hills, and the high ground rising beyond Dunkery Beacon towards Exmoor. The vales of Cleve and Williton nestle to the east, bounded by the Quantocks. Seaward, again, to the north, the eye ranges over Bridgwater Bay to the headland of Brean Down and Worle, and commands the west or opposite coast from Penarth Point to Aberavon and Swansea. "The scenery is neither colossal nor overwhelming." "It is infinitely beautiful and picturesque"—

"Bold, rising on an insulated height,
With deep encircling woods, all verdant crowned,
Thy Castle Dunster! proudly meets our sight."

Dunkery Beacon, the highest point of Exmoor, is the weather-glass of the district—

"When Dunkery's top cannot be seen,
Horner will have a flooded stream."

Dunkery was never, it seems, a British fortress, and no remains upon its summit exist beyond the beacon and the ruined fire-hearths' scattered stones. There are no ruined castles in this part of the country, with the exception of Castle Mount at Stowey. Those who visit this district

and go on towards the Doone Valley, the Forest of Exmoor, and away southwards to Dulverton, should not fail to read Mr. John Lloyd Warden Page's "Explorations of Exmoor and the Hill Country of West Somerset." It is a most delightful book, full of information, by one who knows the country and loves its beauties, describing them with knowledge and enthusiasm, cultured by taste.

"BUILDING NEWS" DESIGNING CLUB.

A SEASIDE BATH HOUSE.

IT would be difficult to name a more seasonable subject, just as everybody is turning their attention to holiday-making, and many are enjoying their leisure by the sad sea waves, than a bath house for a watering-place. All must have seen the shockingly ugly, and for the most part exceedingly inconvenient, buildings which hitherto have done duty in various parts of the country in not a few small towns along the coast. At Brighton, Scarborough, Bournemouth, and other fashionable resorts, large bath houses, of course, have been erected years ago; but in the majority of the less important seaside places the accommodation which exists of this kind is extremely inadequate and out of date. We therefore thought it might serve a useful purpose if our Designing Club contributors would show what might be done in the direction of artistic treatment and convenient planning for such buildings. We publish the result herewith to-day, awarding the first place to "Vulcan," the second to "Smilash the Goth," and the third to "Unitate Fortior." The following are the conditions of the problem which we set with the above view. Whether others would have solved it more satisfactorily or not must be an open question; but we fancy that "Vulcan" has produced a capital design, which, with a few modifications, would make an excellent building.

"A Seaside Bath House for a small Watering-place.—The site is situated with a frontage towards the parade running at the top of the beach. It is 100ft. long by 45ft. deep, part of the depth to be reserved as a garden or grass forecourt. The accommodation to comprise two sets of six slipper baths supplied with hot and cold sea-water—one set for ladies and one for gentlemen; a drying-room for airing towels, and a small room or office for the attendants (two females and one male). The entrance hall to be commodious enough for waiting-room purposes. A verandah may be put partly along the seaside front. Each department is to have two w.c.'s and a lavatory basin. Provision to be made for a storage cistern at roof level. Elevations in stones and slate roofs. Building to be on one floor. Style bold and simple, suitable for an exposed situation. No skylights. Scale 8ft. to the inch. Plan may be 1/4th if desired. Elevations, section, and view."

In criticising the plan, it is necessary to follow the provisions thus set forth. The entrance hall, for example, was intended to be available for waiting purposes by both ladies and gentlemen. Some may think that separate entrances are desirable, and with plunge-baths or institutions of large size it may be so; but economy of working is essential in small undertakings of this kind, and by the sea, where men and women frequently take their morning dip in machines immediately adjoining each other, with a numerous assembly of spectators on the beach, it must be a piece of Mrs. Grundyism of the worst kind to fancy that decent folk cannot meet in a common waiting hall attached to a bath-house like the vestibule in "Vulcan's" plan. We name the subject because many correspondents wrote to us asking if we really intended such an arrangement. The ticket-office in "Vulcan's" design faces the entrance, and right and left run the different baths. The drying-room for towels is conveniently located, and the cistern comes in a squat kind of tower over the hall very prettily. The verandah, with its kiosk-like alcoves at the ends, would be very comfortable both in fine as well as shower. The simple and sturdy appearance of the whole composition seems well adapted to seaside exposure, and the building looks like a bath-house. "Smilash the Goth," too, deserves praise, but is a trifle too ambitious with his stone arches to the verandah, buttresses above, and apsidal transept-like bays, of which no use is made in the upper part. The boiler-house and drying-

room are practically considered, far more so in fact than by "Vulcan," who omits the flue from his heating-chamber, which we understand to be under the central part, though it is not delineated. The passage in this plan is between, dwarf divisions separating the baths, thus allowing a better circulation of air, but we lose privacy, which is a necessity, especially for baths used occasionally by invalids. "Unitate Fortior" in some respects is better than "Smilash the Goth," and makes a point with his scheme for ventilation by means of a through trunk from end to end. We presume it is intended to be so over the cistern in the middle part. This, on examination, is hardly so clear as might be wished. The arched, cloister-like verandah is badly proportioned, the arch-stones running up into the frieze, and the design architecturally wants overhauling: the student needs the master at his elbow. Two ticket-offices in the building are needless. If men and women can meet in the hall with impunity, the tickets for males and females won't surely go astray in one office. The hit-and-miss arrangement to the baths, by which a recess for clothes is managed, shows thought. The perspective, however, exhibits no skill, and presents the building in anything but a pleasing manner. "Firefly" is clever, but, like most clever people, cuts capers with endless breaks and dodges. His perspective cramps the front, unfortunately. It would be twice as long as here appears, and would be quite 50 per cent. better. "Firefly" should try more simple methods. He has ability: it requires cultivating and moderating. "Newfardi" at least is simple, but he is not too fond of light. The passages between the baths would be dark, and so would the two little waiting-rooms. There is no verandah to this design, which we place here mainly for its breadth of treatment. Its detail is crude and careless. "Nil Nisi Bonum" cramps his baths too much, and overwhelms the design with the huge central block, where the planning is inconvenient and wasteful, without any notion as to how the working of such an institution is to be carried on. The verandah is of wood, and very slight in construction. "Umbopa" puts a central octagon, which lights the assembly-hall; but it isolates the administrative department into two parts so entirely, that the male attendant has to go into the female corridor every time he wants some dry towels. There is no ticket-office, and the verandah takes the form of a portico. "Umbopa" lets his octagon run away with him, and then finds it so tall within, that he has to erect a sort of conservatory inside, with opaque glass, to hide the roofing over. Externally the effect is not so bad. "Black Prince" endeavours to be original, but he plans shockingly and draws but poorly. The masher drawn in the doorway exhibits at once the hideous proportions of the opening. The plan illustrates how the doors would clash in the ugly lobby inside the angle. "Black and White" gives his quiet design a school-like appearance. The lavatory and w.c.'s adjoining the entrance vestibule would be hardly available with comfort for either sex, as they are so very public, and the hall would be quite dark. "Graham," no doubt, is original, with an attempt after the eminently severe. Sturdiness we like; but then there must be no trumpery detail. The wasteful treatment of the hall, with its alcove for hiding old pot flowers in, to fade and look unpleasant; the attendant's office, with the circular bay like a lady's thimble in proportions, cut off from the working department; and the crowded-in verandahs, go far to spoil his design. "Sweet Auburn" is very neat. He gives his pay-office, with the cistern over it, a big three-light window, large enough for the end of a Baptist chapel. The central hall is commodious, but no real convenience is provided for the proper working of the baths. The attendants' rooms are mere closets, as if these people were put away out of sight till rung for, whereas they have to do the work of the establishment. "Cyclist" gives us a gimcrack harlequinade of a building, and copper balls poised on iron pins along the sky-line make capital cock-shies from the beach. The plan is very crude, and great sacrifices are made to the big octagon hall, with its high conical roof, in which tanks are to be stored, but no one knows how they are to be reached. The other designs are by "Box," "Symbol," "Sphinx," "Perseverando," "La Cigale," "Excelsior," "Don Quixote," "Ivanhoe," "Sector," "Old Stamp," "Peterborough," and "Zingarella."

RAVELSTON-HOUSE-FOUNTAIN

THE CASTELLATED AND DOMESTIC ARCHITECTURE OF SCOTLAND.

THE fourth and fifth volumes of Messrs. David MacGibbon and Thomas Ross's instructive history of the castellated and domestic structures of Scotland continue the descriptions of the remaining edifices of the "Fourth," or last, period, and bring the narrative down from the 12th to the 18th century. Through the kindness of the authors we are enabled to present our readers with two double pages of illustrations from this work. In our last notice of Vol. III. we sketched the classification adopted by the authors of this valuable historical and graphic record, and mentioned a few of those castles and mansions which mainly took the form of the L in plan. Those edifices were simple keeps, and are very numerous, outnumbering those of the types now described, and distinguished as the Z, T, E, and

courtyard plans. The three former types are found mainly in the smaller buildings; the Z-plan, having round or square towers at the extreme angles, was adopted during turbulent times, and was intended to afford protection; next, the T-plan is described as a convenient form for giving separate access to two rooms on each floor of an oblong house by means of a single wheel stair contained in a square or round tower projecting from the centre, while the E-plan was a main block of oblong proportion, having a central tower and stair approach flanked by a projecting wing at each end, and as a more symmetrical arrangement was followed during the "Fourth period." But the buildings designed on the L and courtyard plans were most popular at this period, as will be seen in going over the list of structures given. Of those of the Z type, described and illustrated by plans and sketches, may be mentioned Craigcrook Castle, Midlothian, near Edinburgh, which has been much altered by additions, to adapt it for domestic purposes. The oblong portion or main

block is about 30ft. by 23ft., one round tower at the south-west angle is 20ft. in diameter, and the square tower at the north-east angle 17ft. square. The exterior presents many of the interesting features of this class of castle, such as the circular stair turrets or bartizans corbelled out from the angles and conically roofed, the crow-stepped gables, one of which crowns the square tower. Riccarton House, in the same district, has square towers, and has evidently been converted from the L-shaped block. The staircase turret is introduced, as usual, in the re-entering angle of the east wing. Dargavel, Renfrewshire, is also a remodelled mansion, with circular stair turrets at the opposite angles, and a fine piece of corbelling to angle turret. Of the same type is Dairsie Castle, Fifeshire. Square angle towers occur at Arnage Mansion, Aberdeenshire; Keith Hall, and at Castle Menzies, Perthshire—the last a structure of considerable size and of several stories; this latter is noteworthy as showing the development from the keep to the domestic residence in the 16th century.

MONTROSE PANELS.

FROM AN OLD HOUSE
NEAR MONTROSE
NAME NOT KNOWN
SKETCHED IN A
BROKERS' SHOP
AT EDINBURGH
OCTOBER 1881

DOOR PANELS ARE
22½ INCHES X 6½ INCHES

One of our illustrations (p. 206), taken from Messrs. MacGibbon and Ross's work is an interesting fountain from the garden of Ravelston House, Midlothian, one of the structures of this form, which was destroyed by fire early in the present century, except a staircase tower with stepped gables. The fountain is a unique specimen, and has the date 1630. From the top of upper step to the under side of basin it is 2ft. 8in.; to top of same, 3ft. 9in.; and to top of unicorn on summit, 9ft. 10ft. The diameter of basin is 3ft. 10in., and the shaft 15½in. diameter. "Above the basin the fountain is ornamented with dolphins, through whose mouths the water flows from a hollow cistern inside the stone at the thick part beneath the dolphins. The fountain contains the same initials as the doorway and fireplace, twined together in three love-knots." The fireplace, now turned into a summer-house, is another of the relics illustrated in this work belonging to the old hall, and is a fine example of moulded and enriched jambs and mantel; the outer ornament is a Greek fret, and the inner hollow is filled with square rosettes and a small intervening member of dog-tooth ornament. The cornice is enriched by carving, with a monogram of the owners, George Foulis and his wife Janet Bannatyne.

The E type of plans illustrated comprise a few important structures more or less mutilated. Wallyford, Midlothian, is a fine example, with a good doorway pediment and several details, which are of the Renaissance period. We give one example from Stirling, Cowane's Hospital, a representative of a simple 17th-Century building. As the authors say, "with some infusion of Renaissance, it still preserves a good deal of Scottish character." The central tower forms the entrance, and it once contained a staircase. The middle niche above entrance contains a statue of the founder of the hospital. A tablet over the door contains the inscription: "This hospital was erected and largely provided by

John Cowane, Dean of Gild, for the Entertainment of Decayed Gild Breither. John Cowane, 1639. I was hungrie, and ye gave me meate; I was thirstie, and ye gave me drinke, &c." The hospital is now converted into a guildhall for the meetings of the gildry. On the T-plan several interesting examples are given: Grange-pans, Linlithgowshire; Old Leckie House, Luffness Castle, Haddingtonshire; Lauriston Castle, Midlothian; Queen Mary's House, Jedburgh. Those are distinguished by less of the keep or fortress, and more of the residence character, the staircase turret, or tower forming the projection from an oblong block. Many important plans illustrate the courtyard type. Holyrood Palace is a well-known quadrangular arrangement, several views of which are given. George Heriot's Hospital is another splendid example of the courtyard plan, also well illustrated by some brightly-drawn sketches by one of the authors. Glasgow College, lately demolished, was also a very interesting instance, and both of them are fine examples of the Renaissance style as developed in Scotland during the 17th century. Four periods of this type are distinguished by Messrs. MacGibbon and Ross. During the castellated times a central courtyard was the form round which the buildings were extended, either before or after the introduction of the keep. The third period commenced in 1400, when castles were designed on this plan, and this continued during the fourth period. We have given in one of our double pages a sketch of Hatton Hall fireplace as a remarkably characteristic example of Renaissance. It is constructed of wood, and is in the centre room of first floor of this very interesting old mansion. Pollok Castle, Renfrewshire, is remarkable for some fine specimens of Renaissance gateways and courtyard details. The entrance gateway, shown by a sketch (p. 221), is dated 1694, and we give, as one of our double-page illustrations, a perspective view of the gateway in south wall, interesting for its elegant outline, inverted and

ramped parapet. It gives entrance to the flower-garden, and is the centre feature of the wall, which is terminated by pavilions at the S.E. and S.W. corners. These erections are of later date than the building, which was damaged by fire in 1882. As one of the last of the courtyard class, we may mention Dunrobin Castle, plans and sketches of its present state being given. Some exceptional types of buildings of later date are given. We are enabled to give one or two details. One is a fireplace in a private room, Carnassery Castle, Argyllshire, which exhibits a very elegant form of ornamentation, consisting of fine baluster-like shafts moulded with horizontal members. The drawing we give is a restoration from existing remains.

The "altered and fragmentary" examples of houses form another large class of structures.

We give a sketch in the text of some interesting details of oak door and panels found in a partition of an attic in an old house in Montrose, taken down in 1878. They were brought from Abbot Panter's Hospital, a demolished building (circa 1516). The door measures 5ft. 9½in. high by 3ft. 3½in. wide and 1½in. thick, and the size of panels is about 22½in. by 6½in. It is said to be one of the best pieces of wood carving in Scotland, though whether native or not is unknown. The five panels we give are from 18 found framed in two rows. The centre panel at the top represents fanciful birds resembling those in the foliage of capitals in the Chapter-house of Arbroath, believed to have been built by Abbot Panter. The grotesques, it was supposed by the late Mr. John J. Reid, F.S.A., represent swine dressed as monks, and indicate a pre-Reformation date. The upright stiles are carved. In the door the stiles are decorated with small niches and traceried windows.

Not the least interesting volume of the series is the last, which completes the houses in towns and other omitted structures, and con-

prises descriptions of tolbooths and town-halls, churches and monuments, and Scottish sundials. They illustrate the transition of Renaissance. The accounts given of early Scottish masters of works, master masons, and architects of the Fourth period are valuable contributions to architectural history, and will be read with interest by all who wish to understand the early superintendence of buildings. Very few of the old town houses survive, and many of the illustrations given of them are reproduced from old drawings and prints. We have little space to enter into this part of the author's work. The series of townhalls or tolbooths have many picturesque features, as those of Forres, Tain, Dingwall, Canongate (the latter erected in 1591), especially the towers, which are massive and crowned by octagon lanterns, angle turrets corbelled out, and other forms of roof. The churches are especially of interest, and some good illustrations and details are given of Torpichen, Stirling, Pittenweem churches. We confine our remaining remarks to a few of the fittings of these churches. One of our illustrations represents the pulpit of Fenwick Church, Ayrshire, with its huge projecting sounding board, one of the few remaining examples. The building was erected in 1643. The front of pulpit is circular, and the panels are filled with minute flat ornament. The large sounding-board and carved wings and hour-glass on iron stand, are features of interest, and were common at one period of Scottish church architecture.

A very remarkable example of the internal fitting up of these churches is shown in our adjoining illustration. It represents the grandiose family gallery situated in the north aisle of Kilbirnie Church, and is constructed of oak, for John, first Viscount Garnock, between the years 1703 and 1708, the year of his death. This gallery and its canopy occupies the full width of the aisle projecting into the church, abutting against the east gable. The central portion is convex in plan, and projects about 2ft. beyond the sides. The front portion is occupied by the proprietor and his family, and the portion behind is separated by an open screen (see sketch). Four columns, with capitals and convoluted fret-work, distinguish this pew. A higher screen behind separates the gallery from the entrance passage. The projecting canopy is canted and follows the curved front, the panels of which are filled with armorial bearings, while the canopy has in the centre the family arms or achievement. These are described in detail. But the chief interest is in the elaborate and gorgeous structure itself, so significant of the 18th-century love of family display in churches whose higher functions were then subordinated to family distinctions and personal comfort. The whole design has the appearance of a royal box in a theatre.

On the upper left-hand corner of the same page we reproduce the fine Montgomery monument, erected by Sir Robert Montgomery in 1636 in the old church of Largs, the aisle of which is still preserved. The monument stands in the aisle or north transept of the old church, and is a good example of Renaissance. It was joined to the structure by an open arch, and the aisle has a barrel vault of timber, boarded and divided by ribs into compartments painted representing the old Castle of Skelmorlie, Largs Church, and emblematic and heraldic devices. A plan of the monument and details are given in Messrs. Macgibbon and Ross's work, from which it is seen that the monument consists of a gallery raised by a few steps above a partially-sunk basement, which forms a tomb-house, the door to which is seen in the view. Many similar monumental structures are illustrated, but of less architectural interest, such as the Lauderdale, Haddington, and the Bruce in Carlross Abbey church. The Aberdeen Mercat Cross, designed and built by John Montgomery, mason in Old Rayne, Aberdeenshire, in 1686, stands in the centre of Market-place, Aberdeen, but it has been removed from its original site. It measures 21ft. across, and is 18ft. high to the top of the parapet, and about 12ft. 6in. more to the Corinthian capital. The twelve panels of the parapet contain medallions of the Stuarts, beginning with James I., and the Royal arms and those of Aberdeen. Montgomery was both designer and builder, and the work was erected from a model of timber and pasteboard.

The other sketches we give illustrate sundials: a fine one from Newcastle Abbey, Midlothian,

where there are two dials exactly alike, which stand in the gardens on the east of abbey. The dial is octagonal. Four of the spaces are filled with coronetted initials of William, Earl of Lothian; those of the countess, the arms of the earl, and a figure of the sun, the family crest; the other spaces have dials. The total height is 16ft. from top of upper step. The design is, as suggested, rather too much after a goldsmith's model. The last is a very remarkable and quaint design from North Barr, and the sundial stands in the centre of the old-fashioned gardens of North Barr. The figure is picturesque in its 17th-century prim costume and head-gear, the grotesque-looking hair curls are intended to give strength to the neck, which supports the overhanging sundial, the latter of which is octagonal, with 17 faces. On the upright faces the dials alternate with cup hollows. The height of figure is 3ft. 11 $\frac{1}{2}$ in., of figure and dial 5ft. 3 $\frac{1}{2}$ in., steps 8in. each, and the whole is wrought out of grey freestone. North Barr was for generations in the possession of the Stewarts of Darnley. These sundials form a very interesting section of the work; the variety in the design is remarkable, and it was a happy idea to conclude so important a work on Scottish edifices with an illustration and description of these very artistic accessories of castles, mansions, and churches. The authors have, in fact, classified their materials and treated the subject with the completeness it deserves. The sketches given are numerous—over 200 examples are noticed; they are well selected for the peculiarity of their design, and include those attached to walls of buildings and those disengaged, both of these main groups being treated. The former appear on walls, on gables, corners of houses, over archways, &c., and these are often designed to form part of the building and to become very architectural accessories, as at Heriot's Hospital, Alloa; some are corbelled out, others built in as a quoin-stone, but set crosswise. The detached class are quite as varied, and are divided into obelisk-shaped, lectern-shaped, facet-headed, and horizontal dials. Some of the lectern-shaped are remarkable for their shape, as at Woodhouselea and Ruchlaw. The facet-shaped are also ingenious and ornamental treatments, as at Haddington, Glamis Castle, and those we have illustrated. We congratulate the authors, Mr. David Macgibbon and Mr. John Ross, on having completed their arduous undertaking. As an illustrated record of Scottish architecture planned on a scientific basis, these volumes form a valuable contribution.

THEATRES.—IV.

By ERNEST A. E. WOODROW, A.R.I.B.A.

A THEATRE should be divided, considering the nature of its contents and the class of business carried on in the building, into three principal parts, which should again be divided and subdivided into many other parts, in order to effectually meet the requirements of theatrical management. The three larger divisions of a theatre are the approaches, the auditorium, and the stage. As, in this chapter, we have only to deal with the means of separating these particular parts of the building, it is needless to dwell at present upon the subdivisions contained therein.

To be a safe building a theatre should be so substantially built that any portion of it would withstand a sudden shock or a great additional strain upon any of its parts; it has been said that structural weakness in any part of a theatre which has to contain a large number of the audience, whether moving or stationary, is dangerous in the extreme, and should be guarded against by all possible means. The external walls should be strong and solid, and the cross-walls should be well bonded into them. The chief cross-walls, which in a theatre are quite as important as the external walls, are those which contain the three principal divisions, and separate the approaches from the auditorium, and the auditorium from the stage, the latter being commonly called the proscenium wall. The work these walls have to perform is to create separate fire divisions or risks, like the water-tight compartments of a ship, and in order to do that they should be carried up through the roof of the theatre as well as down to the level of the footings of the main walls; there should be as few openings in them as possible compatible with

carrying on the business of the house, and the provision of egress therefrom.

In the new regulations of the London County Council, there is a full description of the manner in which that body requires the architect who builds within their jurisdiction to design and carry out this portion of the theatre. It is enacted that in all such premises where a stage with a proscenium is erected, such stage must be separated from the auditorium by a brick proscenium wall not less than 13in. in thickness, and such wall must be carried up the full thickness to a height of at least 3ft. above the roof, such height being measured at right angles to the slope of the roof, and must be carried down below the stage to a solid foundation. Not more than three openings are allowed to be formed in the proscenium wall, exclusive of the proscenium opening. No openings must exceed 3ft. in width and 6ft. 6in. in height, and each of the openings must be closed by a wrought-iron door not less than $\frac{1}{2}$ in. in thickness in the panel, hung in a wrought-iron frame so as to close of itself without a spring. No openings formed in the proscenium wall must at the lowest part be on a higher level than the floor of the stage.

In New York the proscenium wall has to be carried up higher than in London—i.e., 4ft. instead of 3ft.—and Captain Sir Eyre M. Shaw advocates from 4ft. to 6ft. as necessary. New York has another provision not included in the London regulations; there the proscenium opening must be arched over by fireproof materials, or an iron girder covered in fireproof materials, to protect it from heat; and if a girder is used a relieving arch is required to carry the superstructure. The custom in England varies; some architects prefer a wood girder of large balk surmounted by a relieving arch, while others employ an iron girder with or without the arch over; but there is no doubt, whatever material is used for the girder, there should always be a relieving arch over to distribute the weight of the high wall above, the wing walls of the proscenium forming the abutment.

The height of the proscenium wall in London must be governed by the fourteenth regulation of the London County Council, which provides that the height of the wall plate carrying the rafters of the roof over the stage must not be less than twice the height of the proscenium opening, such height being measured from the level of the stage at the curtain line. The object of this is, of course, to allow the scenery to be lifted up out of sight without rolling or folding, thus avoiding the great danger of the cloths coming in close proximity to the hanging gas battens. The necessity of this was seen by Saunders a hundred years ago, for he says: "both above the scenery and below, the heights should be increased. Instead of 6ft. or 7ft., the height usually given under the stage, I would propose 20ft. or 30ft. This would give opportunity of much assistance to the machinery, and on either side the carpenters' and painters' shops might be placed communicating with the stage by trap-doors." One is, however, rather surprised, after reading these words, to find the latter part of the above sentence. I suppose, as I hope to be able to point out hereafter, a worse position in the whole building could not be found for the carpenters' and painters' shops, than under the stage floor. With regard to the additional height proposed by Saunders, modern requirements for stage display have demanded and introduced this, and where the stage is not far below the level of the street, such depth can with ease be given to the "mezzanine" and "cellar" below the stage. This, of course, adds to the depth of the proscenium wall which divides the mezzanine of the stage from the orchestra.

The decorations or enrichment of the proscenium opening must be constructed of fireproof materials. The New York laws require that if the moulded frame round the proscenium opening be of metal, it shall be filled in solid with non-combustible material, and securely anchored to the wall with iron. Whatever material is used, the solidity of the construction is, of course, of immediate importance. Carton pierre is a favourite material, but of late marble has been much used in decorating the opening. In treating the proscenium opening from an artistic point of view, it must never be forgotten that it is but the frame for the living picture represented on the stage, and it must, neither by form nor colour, detract from the stage, but be a setting to the picture.

The width and height of the proscenium opening are the key to the whole interior of a theatre. From tables of dimensions of various moderate-sized theatres, it is found that 30ft. is about the average width of the opening. For the safe and convenient working of the stage, the outer side stage walls must be, at the very least, 60ft., or twice the width of the proscenium opening—in fact, a somewhat greater width of stage is required for the convenient manipulation of the scenery “sliders” and “bridges.” With a stage opening of 30ft., the slides are 30ft. wide, and it requires rather more than 15ft. more to take off the “sliders” on either side. Now, as the width of the proscenium opening determines the width of the stage, and the position of the main side-walls of the stage, so it will be found that the width and height of the opening govern the location of every seat in the auditorium. This will be further explained in a forthcoming chapter on the sighting of the auditorium. No house is a good one unless a good view of the stage can be obtained from every seat. People pay to see, and it is vexatious not to get what one pays for. As the square or frame through which the picture is to be seen is limited in size, so the radiating sight lines must be governed, and these lines determine the pitch of the seating of the various tiers, both at the sides and in the centre of the house.

But I am drifting away from the subject immediately under consideration—namely, the division walls of the three main parts of a theatre. The wall dividing the auditorium from the corridors at the back and sides must of necessity be pierced by such openings as will give access and egress from the corridors to the seats, and the number and position of these must be governed by the number of people seated on each tier or division of the audience. To effectually create a fire-resisting division between the auditorium and the corridors, one would naturally require a heavy fireproof door made to close of itself. This, however, in the auditorium would become a matter of impossibility and extreme danger to the public, as self-closing iron doors which are in frequent use are a source of danger and annoyance, inasmuch as they often jam the fingers of those passing through them. The constant jarring and banging of heavy doors in an auditorium would effectually put a stop to any serious artistic performance on the stage; the ordinary wooden swing doors are bad enough as it is. The fire-resisting doors described in the revised laws relating to the construction of buildings in the city of New York are allowed in that city to be constructed of pine or other soft wood, of two thicknesses of matched boards at right angles with each other, securely covered with tin on both sides and edges, with folded lapped joints, the nails for fastening the tin being driven inside the lap; the hinges and bolt, or latches, being securely fastened to the door after it has been covered with the tin. Where such doors are used they should be hung upon an iron frame, independent of the woodwork of the doors, or on two iron hinges securely fastened into the masonry. A door built up in this manner would, it appears to me, be light and suitable for use between the auditorium and the corridors, for it would retard the spread of smoke or fire from the auditorium to the corridors for some little time. A door of hard wood or asbestos in an iron frame would also be effectual up to a certain point; in fact, a door of any material would be better than no door at all, with perhaps the exception of doors with glass panels.

Another phase of the question naturally arises when one has to provide sufficient means of retarding the spread of fire through the prescribed and necessary openings in the proscenium wall. Here the doors are not constantly on the swing, and during the whole time of the performance should, with the exception of the orchestra door, be always kept locked. Heavy doors of fireproof materials are therefore admissible and desirable in the proscenium wall, and when they are provided on both sides of the wall to each opening, a double protection is insured.

The number and size of the openings in the proscenium wall, in addition to the large or stage opening, are restricted in London by the regulation of the County Council already quoted in full.

Speaking from a fireman's point of view, the late chief officer of the Metropolitan Fire Brigade advocated openings in the proscenium wall at the level of each tier. These openings would necessi-

tate iron ladders on the stage side of the wall to overcome any difference of level that existed between the floors in the auditorium and the floors and flies of the stage. With increase of openings there must be increase of fire risk, and although it might be desirable for the fireman, should there be only one employed in the theatre to have access from stage to auditorium at various levels, yet that difficulty would be overcome by firemen being stationed in the auditorium in addition to those on the stage.

It would appear useless to protect the smaller openings in the proscenium wall while the stage opening was left with only the act drop or green baize to divide it from the front of the house; a fireproof or rather fire-resisting curtain of some description is absolutely necessary, and in all new London theatres this protection is now enforced by the rules of the London County Council. For some years past this provision has been made on the Continent, and doubtless the authorities at home would have compelled a like provision of safety had the powers been vested in them to do so to all theatres.

Of the patterns of fireproof curtains which have of late years been introduced, nearly all are fixed on frames, which by various powers are raised bodily above the opening. This, of course, necessitates the height of the proscenium wall being twice the height of the proscenium opening, with a space from the top of the opening to the underside of the roof equal to the space from the stage floor to the underside of the proscenium arch or girder, in order that the curtains may be raised without rolling, folding, or sliding in sections. In old theatres this height is not often found; and this may be accepted as a reason why these curtains are difficult to provide in old buildings.

The thirteenth regulation of the Council which deals with this point is a new one as far as London is concerned; but long before its enforcement several fire-resisting curtains had been erected in the newer theatres of the Metropolis, notably in the buildings designed by Mr. Phipps and Mr. Emden.

The rule reads that the proscenium opening shall be provided with a fire-resisting screen to be used as a drop-curtain, of such pattern, construction, and gearing, and with such arrangements for pouring water upon the surface of the screen which is towards the stage, as may be approved by the Council.

There have been many forms of curtains advocated, but none that can claim to be fireproof, nor does there seem any likelihood of such a curtain being devised, without increasing the weight so as to render its use in a theatre impossible. It has been said by the best authority that the opening should be protected by means of a metal curtain which could be dropped at a moment's notice, and that this curtain should be supported and worked by steel or iron chains. “Such curtains, it is true, have before now been tried, and have not found favour with managers of theatres; but that does not at all affect the subject under consideration. They may have been badly made, badly fitted, or badly worked; but even so, it must be obvious that, in the event of a fire happening, they would have done some good.”

Since these remarks were made, there have been other views expressed on the subject, notably those of Mr. Max Clarke, A.R.I.B.A., who has introduced into several theatres a curtain designed by himself. This curtain claims to be an improvement on the wrought-iron plate curtain, which has been found defective, as it twists and buckles under great heat, and allows the passage of smoke and flames into the auditorium. Its inventor describes its superiority over those made of the wire-gauze, which are fragile and apt to break with the weight or contact of falling bodies; the asbestos curtains, which are easily torn; the canvas and water-spray curtains, which depend upon mechanic means for their efficiency, or the water-curtains, through which smoke can penetrate. The protected iron curtain designed by Mr. Max Clarke is an open iron and wire frame, covered by silicate cotton or slag-wool on each side. The silicate cotton is covered with wire netting, and is said to form an absolute non-conducting material, which can be covered on the auditorium side with the green baize, or be treated as an act-drop.

There is a form of asbestos curtain manufactured by the United Asbestos Company which appears to have been used in several provincial

theatres, as well as in two London playhouses. The asbestos cloth of which it is made is fixed to an iron frame in panels by hoop-iron and bolts every 6in. This curtain is also designed to adapt itself to theatres where there is not sufficient room above the opening to allow it to be taken up whole, and is constructed with the lower part hinged to fold up. In the fire at the Queen's Theatre, Manchester, in 1890, the roof of the auditorium fell in and the centre part of the theatre was completely destroyed before the fire was extinguished; the stage portion was, however, it is stated, saved by the lowering of an asbestos curtain. This is a practical proof of the use of a fire-protecting proscenium screen.

There is yet another fire-resisting curtain before the public—one manufactured by Messrs. John Stones, Limited; the framework of which is made of light L iron or T iron, with suitable stays from the corners to the centres to procure rigidity and to keep it in the square. One side of the frame is covered with thin corrugated steel sheets, lined on one side with silicate cotton, which is pressed or padded in the corrugations and covered over with iron or steel network, which is secured to the steel sheets. The manufacturers claim that their invention has an advantage over the asbestos-cloth curtains, inasmuch as it will not show any signs of fire through the outer sheet being kept cool by means of the silicate cotton packing, which is said to repel the heat; the asbestos curtain, they state, although fireproof, will be liable to cause panic by the glaring appearance it gives when attacked by fire. Another quality claimed for this particular screen is that it is said to be sound-proof, and should any excitement prevail on the stage, the noise would not be heard by the audience.

Doubtless there are several other forms of curtains in the market of various merit; but the foregoing descriptions are sufficient to illustrate the various forms and materials employed. Whatever form is adopted, it should be in constant use, for by this means there is an assurance that the apparatus is in working order, and the fear of alarming the audience by its unexpected descent is avoided. Such a curtain, if the audience are unfamiliar with its appearance, coming down in the middle of a performance would be but the signal of alarm. The fire screen should be so fitted as not to permit the flames or smoke to pass between it and the proscenium wall, and in New York, the law compels it to be fitted in iron grooves built into the brickwork, and extending 6in. into the grooves.

In Brussels, the curtain required is a metallic one or other apparatus “sufficient to intercept the passage of smoke, and to prevent fire being communicated between the stage and auditorium.”

In St. Petersburg, the curtain must be stout, durable, and non-inflammable, so that in the event of fire it will not easily bend by the weight or pressure of gaseous vapours, nor break by the falling of the scenery upon it, nor allow the smoke to pass in such quantities as to be dangerous to human life, or be destroyed by the great heat at the outbreak of a fire; it must be so constructed as to be easily let down without danger to the man in charge of its working.

In Hamburg, the permanent decoration of the proscenium must be fixed close to the iron curtain, and in Paris the wire gauze curtain demanded must be hung with combustible cords and counter-weights on metal ropes to check the too rapid descent. The Mons Board of Works advocate a water curtain, and in Antwerp metal curtains are required. From this it will be seen authorities differ widely as to the material that should be employed.

SANITARY SPECIALITIES.

MESSRS. THOMAS CRAPPER AND CO., sanitary engineers, of the Marlborough Works, Chelsea, S.W., have just issued a new catalogue and price list of their special manufactures, fully illustrated and brought up to date. The index to the well-bound volume indicates the large variety of the sanitary fittings and appliances made by this well-known firm. Amongst these we notice first the very excellent “Improved Kenon Trap,” suggested by Professor Corfield, M.A., M.D., to which we have before drawn attention, and which in face of other inventions still holds its own as a trap which allows the rapid discharge of sewage with

The least friction, on account of its egg-shaped section with ready access for cleansing. Architects and sanitary experts cannot do better than specify the "Improved Kenon" disconnecting trap for house drainage. The trap is made to 4in., 6in., and 9in. sizes, and the prices quoted are exceedingly moderate, for a 4in. glazed stoneware trap the price being only 8s. 6d. The channel pipes and junctions for manholes, white glazed, are all figured, and their radii and prices given on p. 13, thus saving time and expense in ordering. We lately spoke of the admirable sanitary air-tight frames and covers for manholes made by this firm, which seem to give all that is required; the covers of these can be ornamented by tiles to match paving. Several sizes are made, and they can be painted or galvanized. The air-tight joint is simple and effective, no hinges being required. Next we come to several improved forms of glazed stoneware grease-traps, designed for use with the automatic flushing tank. The section of invert is egg-shaped, and they are made circular or square, with galvanized iron air-tight cover. Messrs. Thos. Crapper and Co.'s improved automatic flush-tank for flushing drains, made to hold from 30gals. to 100gals., has the great merit of giving a rapid and powerful flush, and every system of house drains should have one. Improved gully traps, and improved closets of various types, are illustrated. One of the most effectual and cleanly is the "improved elastic valve closet," with white china top and dish in one piece. It has a flushing rim basin, and the overflow is kept clear and siphonage prevented. Several patterns are made, some of very moderate price. Crapper's improved siphon water-waste preventer is quite an artistic improvement upon the ugly box type, which architects ought to note, and on p. 49 it is shown fitted to an ornamental flush-down closet. We must also mention Crapper's automatic seat-action closet, well adapted for hotels; their "wash-down" closet, with patent lead connection; the "flush-down" combination closet. The "silent siphon water-waste preventer" is a clever adaptation. We also note the improved wood seat for pedestal closet; the self-rising seat, adapted also for a slop-receiving closet, and various improvements in basins and traps, sinks, and lavatories. Ball-valves and taps, cocks, tanks, cisterns, boilers, and r.w. goods are included in this comprehensive price-list of sanitary fittings, which ought to be in every engineer's, architect's, and builder's office.

BOOKS RECEIVED.

Scientific and Technical Papers of Werner von Siemens, Vol. I. (London: John Murray, Albemarle street).—This volume of scientific papers and addresses, translated from the second German edition, is of much interest to the scientific reader. The collection of papers now published for the first time in this country comprise a variety of subjects of special value to electricians and engineers, but far too numerous and abstrusely scientific for us to deal with in these columns. The first paper, written in 1845, on the "Employment of Heated Air as a Motive Power," describes an engine driven by heated air, which consists of three cylinders, the two outer being alternately heated and cooled, causing an expansive force to take place in the heated cylinder, and to cause a plunger or piston to move in a smaller centre cylinder. Dr. Werner von Siemens points out the advantages from an economical view in perfecting an engine of this kind. Any kind of gas may be employed; the cost of mechanical power is reduced by the reduction in the consumption of fuel. The author's keen mechanical insight into the conditions of a successful machine is obvious when he discusses the difficulties to be encountered in the construction of such an engine, as in avoiding the loss of heat. The Dundee engine described works up to 26H.P., makes 30 revolutions a minute, and a consumption of 6lb. of fuel, whilst the steam-engine of the same power consumed 36lb. The author describes how heat can be retained and fuel further reduced. Another paper follows on "The Application of the Electric Spark to the Measurement of Velocity." Other interesting papers on "Duplex Telegraphy," "Electrostatic Induction," "On the Law of Motion of Gases in Tubes," "On Pneumatic Despatches," "On the Influence of Light," "On the Electric Resistance of Selenium,"

"Standards of Resistance," "On the Unit of Electrical Resistance," "On Currents of Air," and on many questions of physical research are to be found in this volume, which will form a valuable addition to the library of every scientific student and electrician. The papers, although they date from various periods during the last forty years, show the learned author's anticipation of many important discoveries that have taken place.—*The Transactions of the American Society of Civil Engineers* for May are before us. One of the chief papers is that on the "Main Relief Sewer of Brooklyn," by Willard Beahan, M.Am.C.E., illustrated by maps and diagrams. Mr. Beahan gives a descriptive account of this main relief sewer, which has been successfully completed by the Department of City Works, of which Mr. J. P. Adams is commissioner, and Robert Van Buren, M.Am.C.E. chief engineer. The city is divided into sewer districts, the boundary lines of which are the dividing ridges in the secondary or tertiary drainage. The sewers are of various dates, some of vitrified pipe, of cement pipe, and the main district sewers are of brick and stone. The rapid growth of the city has tended to overcharge these sewers, and hence the relief sewer, which intercepts them. The drainage area is 2,000 acres in extent, and the need of relief of storm water was much felt. A provision for this from an area of 1,300 acres was considered sufficient. The maximum rainfall in Brooklyn is 4in. per hour, and it was assumed that 1in. per hour would reach the relief sewer. The sewer described is circular, chiefly 15ft. in diameter in the larger part, and 10ft. and 12ft. at the upper end. It is of brick. The depth of sewer for a great part of the way exceeds 50ft., and this portion was tunnelled. Headway was difficult to obtain in places, and resort to flat tops composed of I-beams, with flat brick arches between to carry the street surface, was made, sections and details of which are given.

—*On the Older Forms of Terracotta Roofing Tiles*, by EDWARD S. MORSE, Director Peabody Academy of Science, is a paper communicated to the Essex Institute, Salem, which appeared in the *American Architect and Building News*. The author describes, and illustrates by sketches, the forms of terracotta roofing tiles used in China, Corea, India, Persia, Greece, Italy, Spain, Mexico, Belgium and Holland, Java, Germany, Russia, France, Switzerland, Great Britain, &c. Mr. Morse's contribution traces back the present roof covering to a remote past, and the typical Roman tile may be found in all these countries. Dörpfeld, in his "Origin of the Doric Style," says it was the invention of the terracotta roofing tile that first made the construction of a sloping roof possible. The Greeks derived the roofing tile from the East; but we must look to China for the early development of the tiled roof, as it was there fictile art began. Graeber describes tiles on the ruins of the Temple of Hera at Olympia, dating nearly a thousand years B.C. The ancient tile consists of two elements, a wide underpiece (tegula) slightly concave upwards, and a narrow semi-cylindrical piece (imbrex) placed in an inverted position to cover the junction of two adjacent tegulae. The open end of the imbrex has often a circular rosette or disc. In Japan and Korea the same type of tile is seen. The tiles are thick and roughly made, the eaves being decorated with scroll patterns, with circular discs of rosette pattern. It is supposed that this type of tile was derived from sections of bark, which was very early used as a roof covering. It is interesting to find the same type in use in Greece; the broad, curved tegula with narrow imbrex is seen, and, in fact, the normal Asiatic type is found in the Orient, Greece, Italy, China, and India. The two latter countries have treated the roofing tile artistically. Massive ridges formed by the imbrex are seen at Shanghai. Mr. Morse's interesting paper is well worth study.—*Holidays in North Germany and Scandinavia*, edited by PERCY LINDLEY (London: 30, Fleet-street) is a capital tourist's guide to these favourite parts of Germany and Scandinavia, by the author of "Walks in the Ardennes," "Walks in Holland," "Walks in Epping Forest," &c. Notes and brief-descriptions of the route, the cost, and the various cities are given, interspersed with very telling illustrations of Hamburg, Heligoland, Lübeck and its Rathhaus, Stralsund, Rügen, Hanover, Hildesheim, the Harz Mountains, and places in Denmark and Norway. The route has the advantage of freshness to the ordinary traveller, and is out of the old track of holiday seekers.

The large German port of Hamburg and its easy reach of Heligoland make alone an attractive trip, and its cost is less than from London to Edinburgh, to say nothing of the smaller cost of North German hotels. Those of our readers who are contemplating a visit to the coasts of the North Sea and Baltic will find this little book of much value and full of just the information they require, the price of which is only 6d.—Two more issues of the handy paper-covered Continental guides, published by Orell and Fussli, of Zurich, at a franc each, under the title of *Illustrated Europe*, have just reached us. No. 133 is devoted to a description of Davos and the railway from Landquart, which has made this healthy resort in the Rhaetian Alps more accessible to English tourists. The work is written by J. Hauri, Pastor of Davos, and illustrated by 29 views, by J. Weber, a native of the same village, and a map. No. 143 of the series describes the *Kursaal Maloja*, an immense mountain hotel of the hardest Austrian Renaissance type just completed on Lake Maloja in the Upper Engadine; it is well illustrated, and has large scale and key maps.

STONEWARE v. IRON PIPES.

SOME useful data are given in a paper by Mr. George Maxwell Lawford on the "Drainage of Town Houses," concerning the advantages of iron pipes for drains passing under premises. Comparing cost between iron and stoneware, taking excavation as common to both, the stoneware is said to work out to 1s. 8d. per foot run, and is made up as follows: 4in. stoneware pipes, per ft. run, 4½d.; laying and jointing, per ft. run, 2d.; bed of concrete, 1ft. by 1ft. 6in. by 1ft. 6in., equal to 2 cubic feet, per ft. run at 15s. per cubic yard, works out at 1s. 1½d. per ft. run. A 4in. coated iron socket pipe, weighing 18lb. per ft. run, costs 1s. 6d. per ft.; laying, 2d. per ft.; jointing, 7d. per ft. run. (Detailed as follows: one joint takes 13lb. of lead at 2d., say, 2s. 2d., and allowing 2d. for oakum, 2s. 4d.; labour, fuel, and clay, 2s. 6d. per joint—total per joint, 4s. 10d.; and with one joint to every 9 feet, the cost is as nearly as possible 7d. per ft.) Totalling these items, the prime cost amounts to 2s. 3d. per ft. run, or nearly 30 per cent. more than the cost of stoneware. This percentage is sometimes exceeded. There is an objection raised by ordinary layers of drains to use anything but stoneware for pipes that pass under the house. In America iron drains are generally used, and in New York, as Mr. Lawford says, they are made compulsory for house drains. The advantages of using them are many. Settlement of the ground does not break them as it does stoneware; the joints of lead and oakum are more secure, and the length of each pipe adds to the security of iron as a material. We should like to see a more general use of iron in the drains passing underneath the house, as we believe the mode of laying stoneware pipes is often faulty and careless in the extreme.

CHIPS.

At the recent Canterbury Diocesan Conference held at Lambeth Palace, Earl Stanhope presented to the Archbishop a replica of Professor Herkomer's painting of the late Bishop of Dover, to be added to the interesting gallery of episcopal portraits in Lambeth Palace.

The position of city engineer of Toronto, which has been allowed to remain vacant for a year, has finally been filled by the appointment of Mr. E. H. Keating. Mr. Keating was formerly city engineer of Halifax, and occupies at present a similar position at Duluth, Minn. The salary offered was 4,000dol. a year, but Mr. Keating demanded, and was promised, 5,000dol.

On Sunday the parish church of Hartburn, after having undergone restoration, was reopened and the new reredos and pulpit were dedicated by the Bishop of Newcastle.

Sir Arthur W. Blomfield, A.R.A., has been appointed as the architect of the memorial to the late Bishop Claughton proposed to be erected in the parish church of Kidderminster.

Mr. Robert Glassby, the sculptor, who assisted Sir Edgar Boehm for many years, died on Wednesday week at Chelsea. Previous to his illness he was engaged upon a marble bust of the late Grand Duke of Hesse, which the Queen had commissioned him to execute, and which was to have been placed in the Royal Mausoleum at Frogmore.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.—	
DURHAM COLLEGE OF SCIENCE, NEWCASTLE-ON-TYNE.—	
CASTELLATED AND DOMESTIC ARCHITECTURE OF SCOTLAND.	
—DESIGNS FOR A SEASIDE BATH HOUSE.	

Our Illustrations.

THE A.A. EXCURSION TO SOMERSETSHIRE,
(See descriptive article on p. 204.)

THE DURHAM COLLEGE OF SCIENCE, NEWCASTLE-
ON-TYNE.

THIS large institution has not been illustrated before, though for some years its erection has been proceeding. The north front and part of the east side were built and opened by the Princess Louise in 1888. The remainder of the east façade and that on the south side are now being erected. The main front, with the great tower over the principal entrance leading to the quadrangle, has not yet been commenced. The first portion cost £23,000, and the present contracts are for a similar amount, so that the entire cost will be between £60,000 and £70,000. The walls are of red brick, with stone dressings, and the roofs are covered with Ruabon tiles. We gave a lengthy description of the building scheme when it was first determined upon, in our issue for Oct. 8, 1886. The museum and school of art are to be located one on either side of the main entrance. The public lecture theatre is to the rear of the tower. The physical laboratory, the lecture room for physics, class-rooms, and chemical laboratories range on the north side, and along the east wing come the chemical lecture hall, the technical chemistry department, and the boiler-house. The south block contains the mechanical engineering, naval architecture, and literary departments. The design, which is a very imposing rendering of a rich phase of English Jacobean, was the work of the late Mr. Robert J. Johnson, F.S.A., of Newcastle, and may be described as his chief work. It is being continued, and has been carried out since his death, a few months ago, by Mr. A. Crawford Hick, the diocesan surveyor of Durham, who was Mr. Johnson's partner. We hope soon to be enabled to illustrate the work more in detail.

THE CASTELLATED ARCHITECTURE OF SCOTLAND.

A REVIEW of this important work by Messrs. Macgibbon and Ross, illustrated with further sketches, will be found on p. 206 *ante*.

A SEASIDE BATH HOUSE.

THE bath-house designs received in the BUILDING NEWS Designing Club competition are critically dealt with in an article on p. 205.

Herr Theodor Hoeck, an architect of the Prussian Ministry of Public Works, has been attached to the German Legation at Washington.

The Countess Grosvenor on Saturday laid the foundation stone of a new church for Saltney, an industrial suburb of Chester. The church is to cost £3,000, and is to seat 325 persons.

COMPETITIONS.

GORTON, MANCHESTER.—For the proposed free library for Gorton district, the city council of Manchester have adopted the designs submitted by Messrs. J. W. and F. Beaumont. The estimated cost of execution is £3,850.

KINGSTON-ON-THAMES.—In reply to the advertisements issued by the town council for designs for a new swimming-bath and extending the Queen's Promenade, half-a-dozen architects sent in designs. At the last meeting of the town council a committee recommended that a premium of £20 be granted to the author of the design under motto "Kingfisher," and £10 to the author of that entitled "Sunlight." The names of the authors were ascertained in open council, and the first was Mr. E. Carter, of 55, Clarence-street, Kingston, and the second Mr. W. H. Hope, surveyor to the Kingston rural sanitary authority. Mr. Carter was appointed architect on condition that his design can be carried out for the sum of £4,435, the estimated amount. Major Macaulay, C.E., acted as assessor.

SALISBURY.—At the quarterly meeting of the Salisbury city council on Friday, the design of Mr. Edward Webb, architect and surveyor, of Queen-street, Cardiff, was accepted for the erection of the tower near the Infirmary, for the new town clock, given to the borough by Dr. Roberts.

WALSALL.—The town council adopted on Monday the recommendation of a committee that the first premium in the preliminary competition for a town hall should be awarded to Mr. J. R. Withers, of Shrewsbury, and the second premium to Mr. Daniel Arkell, of Birmingham. It was further decided, on the committee's advice, to offer three premiums of 100 guineas, 75 guineas, and 50 guineas respectively, for complete designs, with specifications and estimates, the cost of the building not to exceed £20,000, and the main hall to contain seating accommodation for 1,800 persons, calculated on a basis of 13in. for each person, with gangways 12in. wide. A proposition that a sub-committee should be empowered to lay down the conditions upon which competing designs should be invited led to a long discussion, but was adopted by a majority of two to one, an amendment seeking to restrict the outlay to £15,000 being rejected. With regard to a second-competition, that for the proposed public baths, a committee reported that twenty-five sets of plans had been received, and that the Baths Sub-Committee had been asked to select the three sets which, in their opinion, were entitled to the premiums offered.

The subscriptions to the fund with which a memorial is to be raised to the late Mr. Oliver Heywood, a prominent philanthropist in Manchester, now amount to £2,663. A meeting was held on Monday, at which a division was taken as to whether the statue to be erected should be out of doors or within the Town Hall. By 14 votes to 12, it was decided that the statue should be placed out of doors. It was suggested that a suitable site could be found in St. Ann's-square.

Considerable additions and alterations have just been made to the Northern Counties Railway Hotel at Portrush. Mr. Lanyon, of Belfast, is the architect, and Messrs. McLaughlin and Harvey are the contractors.

The restoration of the church tower at Little Wenlock has just been completed at a cost of £400, and two new bells have been added to the three, which have been quartered by Messrs. Taylor and Co., of Loughborough. A new eight-day clock, which strikes on the tenor bell, having two dials, has been also placed in the church, the total cost of improvements amounting to £600. Mr. Roper, of Wellington, was the contractor, and the reopening services took place last week.

The trustees of Shakespeare's birthplace, obtained possession, on Monday, of Anne Hathaway's cottage, Shottery, Stratford-on-Avon, and this interesting Shakesperian relic will now be preserved and maintained as national property under a legally constituted trust. Fifty years ago the cottage was sold by the father of the present tenant, who claims to be a lineal descendant of the Hathaway family for £345. Three months ago, Shakespeare's trustees gave £3,000 for the property. Between fifty and sixty years ago the end portion of the cottage was divided off, and let as a separate tenement. It is now to be opened up as part of the cottage proper, the partitions are to be removed, and the Elizabethan bedstead is to be put back into its original position—an apartment on the ground floor, known as the sleeping chamber.

ARCHITECTURAL & ARCHAEOLOGICAL SOCIETIES.

NATIONAL ASSOCIATION OF MASTER BUILDERS OF GREAT BRITAIN.—This association held its twenty-ninth half-yearly meeting at Newcastle-upon-Tyne on the 26th ult. The president, Mr. J. C. White, of Liverpool, occupied the chair, and representatives from the local associations at London, Liverpool, Birmingham, Bradford, Shrewsbury, Preston, Newcastle-upon-Tyne, Newcastle and Potteries, Leicester, South Shields, Gateshead, Huddersfield, and Derby were present. The report and accounts for the past half-year were adopted. The report stated that during the past six months the Bath, Ipswich, and Isle of Portland Associations had joined. Reference was also made to the important compromise effected in the London district in June last, at which a new series of working rules were agreed to on both sides, and it was also decided to advance wages, both to skilled workmen and labourers in all trades, 3d. per hour. The report added: "It is hoped that the action taken by the London masters will have the effect of preserving peace and quietness in the trade for some years. It is well to mention that the trades were working four different sets of hours. There were no definite rules as to overtime and country money. All these points are now settled on a permanent basis, and it is felt that the concession of wages is met by the settlement of these different points." The Association confirmed the proceedings of their Council in regard to the form of contract now under negotiation, as amended by the Council, and resubmitted to the Institute of Builders, through whom it is to be presented to the Royal Institute of British Architects. A discussion took place as to the question of worked stone being sent from the quarries to the yards or works, and also other matters connected with the building trade. It was decided to hold the next meeting at Derby.

ROYAL ARCHAEOLOGICAL INSTITUTE.—The annual meeting of this institute was opened at Cambridge on Tuesday, when a welcome was offered by the Mayor and Corporation and the Vice-Chancellor at the Guildhall. It is thirty-eight years since the institute visited Cambridge. Earl Percy, the president, replied. The architectural section was opened by an address from Professor J. Willis Clark, the chairman of the section, and President of the Cambridge Antiquarian Society, and visits were paid to various places of interest. On Wednesday there was an excursion to the Cambridgeshire dykes and to Bury St. Edmund's.

CHIPS.

Mr. E. Bernard Tyzack, Shirley, Sharrow, Sheffield, has placed a new clock, with two large ornamental dials and two bells, to the parish church, Sharrow, Sheffield. The clock and bells were supplied and fixed by Messrs. Wm. Potts and Son, of Guildford-street and Cockridge-street, Leeds.

The county council of Cornwall have just issued a bluebook folio of health and other statistics for the county for 1891. It has been compiled by Mr. Silvanus Trevel, M.S.A., of Truro, the chairman of the committee, and gives much useful information as to the progress and welfare of Cornwall.

The vicar and churchwardens of Winnington, near Northwich, with a building committee, recently invited competitive designs for a new church of St. Luke, to seat 500 persons, and to cost, say, £5,000, on a site reserved.

The Glasgow Institute of Fine Arts is about to make a new departure by instituting a series of autumn lectures, which will be given in Glasgow and other parts of Scotland. The lectures will be given for the benefit of the building fund of the Institute.

The parish church of Churt, Surrey, was reconsecrated last week after the rebuilding and enlargement of the chancel at a cost of £500, borne by the Right Hon. George Cubitt. The work has been carried out by Messrs. Tompsett and Kingham, Farnham, from designs by Mr. E. B. P'Anson. The old chancel has been lengthened about 3ft., the east end made square, the roof carried to the height of the rest of the nave, two additional windows opened out, a new chancel arch provided, the altar has been raised two steps, and a piscina inserted in the south wall of the chancel. A new organ-chamber has also been provided. The whole of the new work is in the Transitional style. The additions are faced with Bargate stone, and the coigns and tracery have been carried out in Bath stone.

ABERDEEN MERCAT CROSS

CASTELLATED & DOMESTIC — ARCHITECTURE — OF SCOTLAND.

BY DAVID MACGIBBON & THOS ROSS ARCH^{TS}

NEWBATTLE ABBEY - SUNDIAL

WAYSIDE NOTES.

THE British Association meeting has afforded no features of very special interest to architects. Compared with former years, the subjects of discussion have been rather lean and threadbare. Old friends, such as "the atmosphere of towns," &c., have reappeared with the methodical precision of the seasons. It seems a pity that the programme is not rendered a little more up to date and apropos of current events. For example, the planet Mars, being in a favourable position for observation, would have been an interesting subject for able papers, and volcanic eruptions being of the present hour, more might have been said about them. Instead of a few great subjects, many puerile and senseless ones came under discussion. "The Prehensile Power of Infants" was the subject of a paper on Monday, and we learned the interesting fact that a newly-born child will support its own weight for a minute on a doctor's finger, while a record of a three-week-old is 2min. 35sec. This shows how we may live and learn. It will strike many as being immensely funny that at the end of this paper, an indignant lady scientist "repudiated the idea that because babies had this prehensile power they must go back to the ape for its origin."

As I have said, the impurity of the atmosphere of cities came up as an evergreen topic. Dr. J. Bailey, of Manchester, read a paper before the Chemical Science Section on Tuesday, and gave some facts with regard to the state, conditions, and causes affecting the air of large towns, the conclusions wherefrom may be well pointed out as striking examples of platitudes. "More smoke, more fog," is the paper in a highly condensed form, and some people knew this before. Sir Douglas Galton, in the discussion, dealt several blows at the open fireplace—a device much abused and ill-treated down in the dust years ago, yet always coming up to time, and holding its own against parsons' grates and other so-called slow-combustion stoves. One would like to ask so eminent an authority as Sir Douglas whether, in view of the "large quantity of decomposing matter from stables and ashpits and street pavements," not to mention the emanations of sewer-gas from street ventilators and other points—the carbon in the air of a large city does not comprise a very effective disinfectant, and whether a little carbon in the nostrils is not preferable to much fever in the blood? We hear a good deal of "London fog." It is generally supposed to be *sui generis*, and head-and-shoulders above other varieties in point of density and blackness; but on the June morning after my arrival at Glasgow—whilst recently in Scotland—there was a thick gloominess about the city that we are not accustomed to in the summer months even in London.

Professor Preece, on Monday, read a paper before the Mechanical Science section, dealing with the destruction of lightning protectors by recent municipal legislation. The point raised is curious and interesting. It appears that it is considered that the marked immunity of private houses in this country from being struck by lightning is due to the fact that the lead on the roofs, and the iron pipes draining the roofs, being connected, form admirable lightning protectors. As householders are now required to remove these pipes from direct connection with the drains, and to leave an air space, the electrical conduction of the pipes is broken, and the pipes ceasing to be a lightning protector, the houses are exposed to the dangers of atmospheric electricity. Poor householder! Another danger! It is satisfactory to know that Professor Preece, while discovering these fearful risks, has found a way out of the difficulty. The remedy that the professor proposes is that while three-fourths of the circular section of the pipe are removed, one-fourth may be retained to maintain electrical connection.

During the recent carpenters' strike much work that would have been done in wood was carried out in iron, and something of the same kind has happened in connection with the ship-building trade. Mr. J. Price, general manager of Messrs. Palmer's shipbuilding yard at Jarrow, gave evidence before Group A of the Labour Commission on Tuesday, when a sitting of the Commission took place at the Westminster Town-hall. Mr. Price

instanced a case where the joiners in their engine-shops refused to allow the carpenters to do certain woodwork which was wanted to finish two large ships. The carpenters would not allow the joiners to do it, and neither side would consent to submit the point to an arbitrator. As a result, the manager had to get the work done in iron instead of wood, in order to get the ships away. We shall hope that the carpenters and joiners saw the folly of their ways. Jealousy between the trades, says Mr. Price, is very marked. Jealousy between plumbers and fitters led to work being passed from one branch to the other and back again, in order that each might do some little portion claimed by them respectively. Such is particularly the case with the fitting of pipes and their flanges, which, it is said, could be done almost completely by either. This action of the workmen is extremely foolish, and in the case of Messrs. Palmer's shipbuilding yard has led to loss of time, increased cost, and the driving of trade into foreign hands. We know what this sort of thing is in the building trade. The necessity of calling in men of another trade to do ten minutes' work has often struck me as ridiculous, particularly on small jobbing works where the farcical nature of the proceedings is very plain. Unfortunately, masters and employers encourage the principle, especially where there is a bill to make out, and plumbers', carpenters', and plasterers' time can all be put down, together with the hods of lime, and bricks, timber, &c., that seem, on paper, to make up a vast deal of work. Doubtless the employers would say that it was the men who were responsible for the system; but a system that answers so well when an account or bill of extras has to be made out, is not likely to receive much discouragement.

Dean Argles' gift to the Peterborough Cathedral—a magnificent marble pavement—has now been completed, and the Italian workmen who have for many months been engaged on the work, have proceeded to Truro Cathedral to carry out a similar scheme. There is thus an added attraction to Peterborough Cathedral, and those going into the neighbourhood should endeavour to see this new work, which is said to be so good.

I notice that the completion of the widening of Ludgate Hill gives a more extensive view of St. Paul's Cathedral. As far down as the railway bridge one can see the whole of the south tower and the major part of the great portico.

The Royal Archaeological Institute this year holds congress at Cambridge. At the commencement of proceedings on Tuesday, when the mayor and corporation welcomed the members in the Guildhall, Earl Percy, president, addressed the meeting and advocated greater unity among the different archaeological societies in the country, recommending that there should be a great central body, with affiliated societies in the provinces. The need or use of such a combination does not occur to one. As means of pleasurable passing winter evenings and going upon picnic excursions in the summer, archaeological societies are very good institutions; but what definite object could be fulfilled by such a banding together as Lord Percy suggests is not very apparent. If, indeed, they could imbue the public with a more general appreciation of the beautiful in architecture, it would be a very good thing; but I do not think that our archaeological societies have done much in this way, although they have had abundant opportunity.

GOTH.

The death is announced from Brussels of M. Joseph Stevens, the well-known animal painter, and elder brother of the still more famous Belgian artist M. Alfred Stevens, who was with him when he died. Joseph Stevens was born in 1819. His paintings were highly esteemed throughout Europe, and gained him many distinctions.

The Mercantile Dry Dock Company, Jarrow, which has been in operation for the last three years, formally opened their second dry dock, at Jarrow, on Thursday in last week. The contract for the making of the dock was let to Mr. J. Best, of Edinburgh, and the engineer of the works is Mr. James Watts Sandeman, of Newcastle. The principal dimensions are:—Clear length on floor, 350ft.; width at top, 72ft.; width on floor level, 49ft.; width of entrance, 50ft.; depth of entrance below cope level, 24ft. 9in.; depth of water on sill, 21ft.

Engineering Notes.

BLACKPOOL.—At the meeting of the directors of the Blackpool Tower Co., held at Manchester on Friday, Messrs. Maxwell and Tuke, the architects, reported that the fourth and last foundation for the tower legs was completed, and everything was now ready for the erection of the steel superstructure. The directors visited the works of Messrs. Heenan and Froude at Newton Heath, and inspected the first of the four legs, which is built and put together in the yard. This leg, which has been sent to Blackpool this week, is 50ft. in height and 18ft. square. The directors also inspected a large amount of steel work lying at the works ready for delivery. It was pointed out that an enormous amount of preliminary work had been done in the working of drawings and in setting out and templating the work; but most of this is now completed, and the delivery will now proceed with considerable speed and regularity. At the subsequent meeting of the directors the estimate of Messrs. Heenan and Froude for the lifts was accepted. These are arranged with two cages, each capable of lifting 50 persons at a time. When working at full speed, the return journey will be performed in less than three minutes, including the time occupied in loading and unloading the passengers. The lifts will be actuated by three sets of accumulators, which will be fed by three hydraulic-pressure pumps, and these in turn will be driven by three independent gas-engines of the "Otto" type, with an aggregate of 240 indicated horse power. The engines, pumps, and accumulators are so arranged that they can be worked either separately or together, and the power provided has a margin of one-third over that required for ordinary use.

GLASGOW.—A new gas-tank at Temple has just been completed for the corporation of Glasgow. The tank is the largest in Scotland, and one of the largest in the kingdom, having a diameter of 240ft. and a depth inside of 46ft. It will contain a three-lift gasometer constructed of steel, and have a capacity of six million cubic feet. The tank, and also a new retort-house at Dawsholm, have been built from plans by Mr. Foulis, gas engineer to the Glasgow Corporation, Mr. Robert M'Alpine being the contractor for both undertakings. The special feature in connection with the tank contract is the extraordinarily short time in which it has been completed. It was begun on October 27 last, and since then 90,000 cubic yards of material have been excavated, a large proportion of it being rock, and there have been worked into the tank 20,000 cubic yards of building materials and puddle, so that, with the re-excavations to form the embankment, upwards of 200,000 tons of materials have been handled. The work has been done in about 200 days, giving an average of 1,000 tons of material handled daily.

NORTH CORNWALL RAILWAY.—The first part of the second section of the North Cornwall Railway has been opened from Launceston to Tresmeer. The London and South-Western Railway Company opened the first section, from Halwill Junction to Launceston, in 1886. The second section will extend from Launceston to Delabole, 19 miles; but the distance from the former place to Tresmeer is eight miles. Splendid scenery is witnessed on the route, including the valley of the Kenesey, and the Kenesey river, until the village of Egloskerry is reached, a station for which is now in course of construction. The North Cornwall coach will now meet trains at Tresmeer instead of Launceston, the coach route to Newquay and Tintagel being consequently shortened by the alteration. To construct the line some 350,000c.ft. of earthworks have had to be taken up, and there are 25 bridges of various characters constructed. The gradients rise to 1 in 74 between Tresmeer and Egloskerry, and 1 in 132 is the highest on the four miles of rail uniting Egloskerry and Launceston. The line from Tresmeer to Delabole will be continued, and opened about the middle of next summer. The engineers of the line are Messrs. Galbraith and Church, of London. Mr. J. Salter is the resident engineer, and Mr. C. E. Barron represents the contractors, Messrs. Curry, Reeve, and Co.

The death is announced from the island of Sylt, on the west coast of Schleswig, of the landscape painter Emil Schindler.

STONE ARCHES OF LARGE SPAN.

THE largest two stone arches in the world are the one over the Adda at Treyyo, and the other over the Dee, near Chester. Of these, the former is built of granite, and has a span of 251ft. The latter is constructed of sandstone, with a clear opening between abutments of 200ft. Stone arches, if properly designed and erected, are in themselves—that is, so far as the absolute “vault” is concerned—practically indestructible. A comparatively small settlement in their foundations, or in almost any part of the structure, will, however, bring about their premature decay and ultimate destruction. The immovability of their supports is essential to their self-preservation.

In a recent number of *Le Genie Civil* there is a design and description of a stone arch of 330ft. span, which possesses features of both novelty and interest. The author of the design is M. C. Tourtay, Ingenieur des Ponts et Chaussées, who, similarly to some other engineers, considers we have not yet reached the useful limit in the dimensions of arches of masonry. Curiously enough, there exists, as will be pointed out, a community of idea or analogy between the arch under notice and the principle of the continuous or cantilever

girder. It will be seen from the skeleton elevation in the annexed cut that the entire structure consists of three separate pieces—namely, the thin arch A and the two massive curved abutments B and C. The latter, although really independent, do to some extent form a portion of the arch, since the curves of pressure, shown by the dotted lines, are continued down and contained within their thickness. All dimensions on the cut are in feet and decimals, from which, putting S for the span and V for the versed line of the segment, $\frac{S}{V} = 0.125$.

The form of the arch A is that known as “surbased,” of which the generatrix is always greater than the half circumference, and the particular curve of it is the catenary. The author insists strongly upon this curve, as it has long been proved to be the one the best adapted for surbased arches of large span. It is the curve of equal resistance, and as such permits of the line of pressure being drawn in such a manner as to pass nearly through the centre of the joints of the arch-stones, and exert upon each a pressure nearly constant. From the fact that the intrados or soffit is parallel to the extrados the arch is also termed “extradosed.” An existing example of this somewhat peculiar form of arch is to be found in the roof surmounting the lantern at the Pantheon, in Paris.

In order to allow of the proper settlement of the arch when the “centres are struck,” as well as for the expansion due to variations of temperature, “articulations” or hinges are to be provided both at the springings and at the crown. In the braced iron arch, as well as in other types of iron bridges, this proviso is frequently insisted upon by some engineers. Theoretically, no doubt, the precaution is an excellent one, but, as a matter of fact, the “hinges” of an iron arch bridge in France having a span of over 300ft. have been removed, and the arch made continuous at the crown, without the stability of the structure having been the least impaired. It does not necessarily follow that the same course would be advisable with a catenarian stone arch, but, whether or no, the effect is to induce a settlement in the spandrels at DD in the figure, which assumes the form of an open joint, the extent and importance of which will depend upon the magnitude of the structure. It is evident that the curve of the abutments is not a prolongation of that of the surbased arch. The object of this difference is to insure that at no point shall the line of pressure approach either the intrados or the extrados sufficiently closely to risk the opening of any of the joints. In ordinary circular arches the point of rupture is usually located at

an angle of about 30°, and if the curved abutments in the “cut” were traced with a radius approximately equal to that which would prolong the curve of the arch, the point of rupture would be found at nearly the same spot. But by tracing the curve of the abutments with a much larger radius, the line of pressure is maintained well within the proper limits of safety. In the figure, one of the abutments is curved to a radius of 181ft. and the other to one of 198ft., the latter being purposely so drawn, in order to show the effect upon the dotted line of pressure, which is thus thrown more towards the extrados.

In the cantilever and continuous girder bridge the object of the principle is to bring the mass and consequently the weight of the whole structure nearer to the supports, while at the same time diminishing those two items of construction at the centre of the span. Each bridge consists of three parts—confining our attention for the moment to a single span—namely, the two cantilever portions and the central length. If, in a cantilever bridge, the central girder be removed, the two others will remain unaffected by its absence. If, in a continuous bridge, the girder be severed at the points of inflection or of contrary flexure, and the central length removed, the equilibrium of the remaining lengths is undisturbed. This operation was carried out in the case of the Boyne viaduct, which is a continuous girder bridge of three spans, the middle having a length of 260ft. The points of inflection in a continuous girder correspond to the junction of the central and side spans in a cantilever bridge. The two systems are nearly identical both in theory and practice, although there is a marked difference in actual construction.

Regarding the surbased arch and curved abutments, more in a horizontal than in a vertical plane, it is evident that the arch may be considered as analogous to the central girder of the cantilever bridge, and the curved abutments to the cantilever portions over the supports. The object in both is the same—that is, to reduce the dimensions at the centre to a minimum while augmenting them nearer the *points d'appui*. As the curved supports in the figure are to act strictly as abutments, they would stand alone, and consequently the central length—that is, the surbased arch—might be removed without in any degree imperilling the stability of the remaining part of the building.

CHIPS.

Foundation-stones of a Primitive Methodist chapel were laid last week at Mainstone, near Bishop's Castle. The building will be Gothic in style, and Messrs. T. Jones and Sons are the builders.

The Priory Gatehouse at Worksop is about to be inclosed. It has been taken in hand by the Cowley Fathers, and a scheme is on foot for the diversion of the Prior's Well-road which now runs under it in order to inclose the gatehouse in the Priory Church grounds. The Duke of Newcastle has undertaken to defray the cost of the new road, the contract for which has this week been let to Messrs. Cope and Rayner, of Nottingham, at £765.

On Saturday the memorial stone was laid of new flour-mills now being erected at Bonnington, Leith, by the Scottish Co-operative Wholesale Society. The mills, when completed, will be capable of an output of about 4,000 sacks of flour per week, and the warehouse will hold about 40,000 sacks of flour. The machinery is to be provided by Mr. Simon, Manchester.

The annual Ecclesiastical Art Exhibition, which has of late years been an adjunct to the meetings of the Church Congress, will take place this year in part of the building used for the Folkestone Exhibition of 1887. The exhibition will, as usual, embrace every object used in the building and adornment of churches—goldsmiths' and silversmiths' work, ancient and modern and ecclesiastical metal work in general, tapestry, embroidery, wood and ivory carving, church furniture, paintings, drawings, and architectural designs.

Brother M. H. Shaw Stewart, M.P., Provincial Grand Master of Stirlingshire, laid the foundation-stone on Friday in connection with the proposed restoration of the south, east, and west aisles of Falkirk parish church. It is intended to use the new aisles as halls for Sunday-school and other church purposes. The cost of the restoration and of placing an organ in the present building, which it is also proposed to do, is estimated at about £3,000. Mr. Watson, of Messrs. Wardrop and Anderson, Edinburgh, is architect for the work, while Messrs. Forster and Andrews, Hull, are the builders of the organ.

Building Intelligence.

BAYSWATER.—A convent chapel was recently opened at the Convent of the Daughters of Sion, Bayswater. The building is Renaissance in style. The chapel is approached by an entrance-hall, with portress's lodge and waiting-room adjoining. The chapel, which will seat about 250 people, consists of a nave and side-aisles, the principal feature being the altar, with a large reredos, and with niche containing a statue of Our Lady of Sion. The ground floor is devoted entirely to the use of the community, and classrooms occupy the first floor. Over these are three other floors of dormitories, the music-rooms being relegated to the top floor of all. The building has been carried out by Mr. B. E. Nightingale, of Albert Embankment, from the designs of Mr. Arthur Young.

DULWICH, S.E.—Last week the foundation-stone of a new parish church for Dulwich was laid by the Duchess of Teck. The new church, which will be dedicated to St. Barnabas, will, when complete, accommodate 790. The portion proposed to be built at present will hold 500. The style adopted is Perpendicular, of the Norfolk parish-church type, the complete church being designed to consist of nave and aisles, with north and south porches and a large western tower forming a baptistery, a chancel with morning chapel on the south, and vestries on the north, the organ being placed in a gallery over the priests' vestry. The materials used are brick and terracotta, with red stone for tracery and dressings, and slated roofs. The church will be heated with hot water. The architects are Messrs. Oliver and Leeson, of Newcastle-on-Tyne.

HULL.—The Grosvenor Hotel in Carr-lane, facing the Arcade, was opened on Saturday. It is Dutch Renaissance in style, cost £12,000, and consists on the ground floor of a restaurant and serving-room, together with a smoking-court, billiard-room, public lavatories, and stock-rooms for the accommodation of commercial travellers. On the first floor there are the commercial-room, 30ft. by 20ft.; coffee-room, 30ft. by 20ft.; drawing-room, smoking room, several sitting-rooms, and a dining-room, 60ft. by 20ft. There are in connection with the hotel about 70 bedrooms. The kitchens and laundry are arranged on the fifth or top floor. The hotel is fitted up throughout with the electric light. Mechanical-power lifts have been fitted up by Messrs. Waygood, of London, and the boilers and steam arrangements are by Messrs. Barford and Perkins, of Edinburgh. The building is from the designs of Mr. W. Alfred Gelder, F.R.I.B.A., and the contract for the building has been executed by Mr. F. Blackburn. We illustrated the hotel in our issue of July 24th, 1891.

KINGSTOWN, CO. DUBLIN.—A meeting was held at Kingstown on Sunday, under the presidency of the R.C. Archbishop of Dublin, in aid of the fund for raising some £1,100 for the completion of St. Michael's Church, now in progress, from plans by and under the superintendence of Mr. John L. Robinson, R.H.A., of Great Brunswick-street, Dublin. The architect explained that he had prepared plans for the completion of the church on the general design of the portion built in the time of the late Cardinal McCabe, but it has been decided to carry out the work in sections. The present contract includes the removal of the flat roof and plaster groining over the chancel, and the erection of a roof of the same pitch and character as that covering the new nave. Some heavy piers close by the transepts have been removed, and new arches, with polished granite columns supporting them, have been inserted in their place. The nave will now be divided from the transepts by lofty moulded arches supported on coupled granite columns with Portland stone capitals and bases. The chancel will now be divided from the nave by an arch, 37ft. in width, supported by six polished granite columns. The chancel arch will be richly moulded and carved. This section is being carried out in such a manner that any of the other sections may be undertaken either now or hereafter without undoing any of the present work. Mr. James Kiernan, of Talbot-street, Dublin, is the contractor. At the close of the meeting promises amounting to £1,138 were made.

LYNTON.—The parish church of Lynton, North Devon, was recently reopened, after having been

restored and enlarged. The old building seated 420 persons, but in the new one accommodation will be found for 550. The work has been divided into two portions, the first of which, costing about £3,000, is now finished. The plans were prepared by the late Mr. J. D. Sedding, of London. The church may be said to be almost entirely rebuilt, for of the old structure only the tower and south aisle, with a 15th-century oak roof (recently cleansed from plaster) remain. The tower, which dates from the 15th century, has been re-pointed inside and out, and four windows have been added. The work now done also includes the restoration of the south aisle and the complete rebuilding of the nave and north aisle. The walls are built of limestone, the stone dressings and arcades being of Ham-hill stone. The roof is a waggon roof, with oak bosses and deal framing. The body of the church is laid with parquet flooring, and the aisles with Portland stone and slate. The new stained-glass windows have been designed to illustrate the Benedicite, beginning with the west window, and continuing round to the window next to the north porch. The masonry work has been carried out by Messrs. Bryant and Sons, of Barnstable; the carpentry by Mr. Gardiner, of Landkey; and the glazing by Mr. Allen, of Barnstable. It is proposed to light the church with the electric light in September.

ROCHESTER CATHEDRAL.—According to the writer of "Cathedral Notes" in the *Rochester Diocesan Magazine*, the north nave turret was condemned solely on the ground that it was in so bad a condition that its face would have to be entirely renewed, and that such restoration could not be carried out so as to preserve its original character. It was merely rubble work—the odds and ends of the mason's yard, put together without properly constructed groins, its face having been patched up at various times with mortar or cement and bits of flint. It was cracked right through from bottom to top in two of its angles. The mortar was quite rotten; in fact, when it was pulled down—for the turret is now gone—the workmen found it difficult to keep some parts of it from crumbling down under their hands. With regard to completion of the north nave turret and of the two side turrets, the committee first of all asked Mr. J. L. Pearson, R.A., their architect, to submit designs of his own conception in a style other than Norman; but, having had fresh evidence brought before them of the character and dimensions of the Norman turrets which were standing 150 years ago, they have decided to reproduce them.

TIR PHIL, GLAMORGANSHIRE.—On Sunday last the Bishop of Llandaff opened a new mission-room and Sunday-school which has been built at Tir Phil for the Rev. S. Bees, vicar of Pontlollyn. The building will accommodate about 200. It is Domestic Gothic, plain in style, but effective architecturally. The walls are of native stone, with Ebbw Vale red pressed brick and Bath-stone dressings, the roof being covered with green slates. Mr. Owen Lewis, of Cardiff, was the builder, and Messrs. Veall and Sant, of the same town, were the architects.

WEST BATTERSEA.—On Wednesday week the foundation-stone of the new Church of the Sacred Heart was laid by the Bishop of Southwark, Dr. Butt, in Trott-street, Old Battersea. This, the first church built in England by the Silesian Order, is designed in the Romanesque style of the 12th century, and will resemble, on a small scale, the church of St. John the Evangelist, at Turin, built in recent years by the same order. The galilee of the Cathedral of Durham has to a great extent been followed as a model in the design. The whole of the church is externally constructed of red brick, with stone dressings sparingly used. The plan consists of a wide nave, with a span of 32ft. in the clear, with two broad aisles, a chancel terminating in a semicircular apse behind the high altar, and two apsidal chapels projecting from small eastern transepts, which terminate the aisles. At the west end will be a lofty tower and spire. The tower is flanked by western transepts, in one of which is the baptistery. The total internal length of the church is 124ft., and its width, including aisles, 65ft. 6in. The nave is groined in wood, with stone vaulting, shafts, and springers, while the chancel is vaulted in brick. The floors, where not tiled, will be all of solid wood-block paving. The heating will be by warm air. Mr. Frederick Walters, F.S.A., of Great Queen-street, is the architect, and the contractors are Messrs. Longley and Co., of Crawley, Sussex.

TO CORRESPONDENTS.

(We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.)

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 382, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL, XLII, XLVI, XLIX, L, LI, LIH, LIV, LVIII, LIX, LX, LXI, and LXII may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

SASHER. (We know nothing of the patent sash referred to. It cannot be much in vogue, or it would be advertised in our pages. We cannot ask for gratuitous advertisements of appliances, &c., in "Intercommunication." If a maker or vendor does not advertise in our pages, it is a pretty sure sign that there is either no necessity for him to do so, or that there is very little demand for his goods—most often the latter.)

RECEIVED.—W. R. and Co.—Elijah.—B. M. R. (Truro)—Reg. Plumb.—S. C. M. Co.—F. R.—Martindale.

Correspondence.

THEATRES.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Woodrow, in his interesting series of articles, has referred to my work on theatre construction, and to my proposal for a "safety theatre," having up-sloping exits in lieu of staircases. He questions the practicability of my suggestion on the grounds of expense, and proceeds to give the dimensions of my proposed site, which I admit are somewhat extensive. In fairness, it should be stated that my theatre is a model theatre—a self-contained building in all that pertains to the business of a theatre and the multifarious trades connected therewith. Hence the seemingly large area required.

The application of up-sloping exits to an ordinary-sized theatre does not necessitate a prohibitive increase in the area of the site. In fact, the requisite increase of area required is already demanded by the L.C.C. Regulation No. 3—if strictly enforced—which provides that a theatre shall not be erected "within 20ft. of any windows or other openings belonging to any other premises overlooking the site."

The superior safety of the ascending method of egress advocated by me for some years past, is admitted by Mr. Woodrow and all who have studied the subject. The only question at issue is the extent of its application, and in my model theatre I have not hesitated to carry out the

principle to its ultimate extent by placing the gallery entrance at the street level.

The L.C.C. Regulation No. 9, which would, as suggested by Mr. Woodrow, prevent my scheme from being carried out in London, does not appear to have been made in the interests of public safety, but rather as a concession to the "stage cellar," and in the supposed interests of drainage.

Mr. Woodrow admits the possibility of constructing a cellar "so as to insure the exclusion and prevent the percolation of surface water," and it is further within the knowledge of architects that modern science has rendered it possible to secure effective drainage in buildings that are at a considerably lower level than the main sewer. In view of these facts, it is difficult to assign a legitimate reason for the existence of such a restrictive clause as Regulation No. 9.

Mr. Woodrow's elucidation of the L.C.C. Theatre regulations will be particularly interesting and instructive. Some of these regulations are arbitrarily restrictive without being protective. In one instance they are positively contradictory, and in another I venture to think impracticable.

The varying value of theatre regulations as a guide to architects is evidenced by the manner in which the vitally important question of ventilation is dismissed with four lines—a masterly display of no knowledge—whereas, nearly three pages are devoted to the subject of electric-lighting.

It is a matter for regret that all provisions pertaining to the safety of the tens of thousands who nightly visit theatres are the result of purely local effort. An affair of such national importance calls for State intervention. Uniformity of theatre regulations is a consummation much to be desired, and Mr. Woodrow's articles promise to be of considerable value in view of prospective legislation.—I am, &c.,

Aug. 9. JAMES GEO. BUCKLE.

A CLUB FOR JUNIORS.

SIR,—I beg leave to suggest, through your columns, that a club should be formed for the youths and junior members of the architectural profession under 18 years of age. The objects of such club should be that friendly intercourse be established between youths and juniors of the profession, that papers be read and discussions held for the instruction and amusement of the members, that a library be formed and sports got up in connection with the club.

I am of opinion that a club such as this would do an immense amount of good, and would be much appreciated among the juniors. I should be glad to receive letters from all in favour of such a club.—I am, &c., G. COLLAS ROBIN.

357, Liverpool-road, London, N., Aug. 9.

The French Minister of Public Works has accepted a contract for the enlargement of the port of Havre, which will cost forty-four million francs, instead of eighty-eight millions, as at first estimated.

The Birmingham District and Counties Banking Company has recently erected new premises on a corner site at Hockley Hill, to which the business of their existing Hockley branch was transferred on Monday last. The bank is built of red Stourbridge brick with dressings of hard Derbyshire and Hollington stone, while a light-coloured terracotta is used in the cornices and parapets. The style is Italian. The banking-room is 33ft. by 27ft. Mr. C. Whitwell, of Cannon-street, is the architect, and Messrs. James Moffat and Sons are the builders.

The baths committee of the Liverpool Corporation to the Upton Asylum, Chester, have paid a visit there for the purpose of examining and reporting upon the Blackman system of clothes drying as installed in the laundry. After looking over the entire laundry, where they first noticed a Blackman fan 42in. diameter, exhausting steam from the wash-house, the visitors were shown the drying-room. Here a most interesting scene was enacted; the committee were so anxious to see everything for themselves, that they took clothes from the hydro and hung them on the lines, where, to their agreeable surprise, they only hung eight minutes before being thoroughly dry. The clothes were sweet, and totally unlike those dried by any other arrangement indoors. Whilst in the old style of drying in closets there is little or no ventilation, and the clothes are practically stewed or baked. With the Blackman system no closets are necessary, the clothes being hung in an open room, through which fresh air is being continually drawn, and the drying is under perfect control.

Intercommunication.

QUESTIONS.

[1823].—**Wood-Block Flooring.**—I should be glad if any of your correspondents can give me particulars for making a good composition for laying wood blocks in flooring.—H. E. G.

[1824].—**Rhine.**—Will anyone who has visited the banks of the Rhine between Coblenz and Bingen kindly say what are the chief objects of interest in the villages, and if the various churches in Oberwessel have any ancient painted glass, or are otherwise noteworthy? Also if any old houses contain original round glass, and where examples can be seen?—RHINE.

CHIPS.

Owing to the rumours of sickness in Paris, the council of the Society of Architects have deemed it wise to abandon the excursion this year.

On Thursday, the 4th inst., the 100th anniversary of the birth of the Rev. Edward Irving, a statue of the great preacher was unveiled in Annan by the Rev. Professor Charteris, Moderator of the General Assembly of the Established Church of Scotland. The statue is placed on a pedestal of Peterhead granite, and is of white marble. It has been executed by Mr. Dods, sculptor, Dumfries. The cost has been £500.

The picture, "The Queen of Sheba's Visit to King Solomon," by Mr. E. J. Poynter, R.A., has been purchased by the National Gallery of New South Wales. It is on view at Mr. Thomas McLean's gallery, 7, Haymarket, previous to being shipped.

An organ, built by Mr. Joseph Brooke, of Glasgow, at a cost of £335, has recently been placed in the Wesleyan Chapel, Farnley, near Leeds. It was inaugurated on Monday.

The latest addition to the National Gallery collection is a large canvas, painted in 1741 by Benjamin Wilson, with whole-length, life-sized portraits of two of the sons of Frederick, Prince of Wales, and their preceptor, Dr. Ayscough. It has been numbered as No. 1364. The famous altarpiece by Francia, No. 179 in the same collection, which was painted on a panel that has of late years rapidly deteriorated, has been transferred to canvas, and rehung in the gallery.

On Wednesday week, a new Wesleyan Methodist chapel at Tanfield Lee was formally opened. The chapel buildings have been designed by Mr. J. W. Thompson, of Newcastle-on-Tyne, and have cost £1,100. Accommodation will be provided for 360 persons.

The Lancaster Bank, St. Anne's-on-the-Sea, is being warmed and ventilated by means of Shorland's Patent Manchester Grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

As two men, named Woods and Mains, employed by Messrs. Bidder and Co., of Manchester, were repairing the top of a chimney at the copper works of Messrs. Newton, Keates, and Co., Sutton, St. Helen's, on Monday, Woods overbalanced himself, and fell from a height of 200ft. His body was shockingly mangled.

Our note on p. 199 last week, with respect to the Hampshire County Council's new offices, of which Mr. James Robinson, C.E., of Winchester, is the architect, was hardly accurate. Sir Nelson Rycroft, in presenting the report, stated that the plans were prepared by Mr. Robinson, and no alterations were made in them by the consulting architect (Sir Arthur Blomfield) except one of the most trifling description. The consulting architect had reported that he considered the plans showed that the building would be an effective one for the purpose for which it was required, that it was conveniently arranged having regard to the site, and that it would be an ornament to the city.

A new church is being built at East Layton, two miles from Darlington, from plans by Messrs. J. P. and H. D. Pritchett, of Darlington. The style is Early Tudor, and the internal fittings will be of oak, the floors in the chancel and passages being of mosaic. Mr. Dods is the clerk of works.

The parish church of Huish Episcopi is now receiving an addition in the shape of an organ chamber, which is being built on the north side of the chancel by Messrs. Hawkins and Son, builders, of Glastonbury, from designs and under the supervision of Mr. Samsen, architect, of Taunton.

A new branch line of railway is being made from Guiseley to Yeadon and Green-lane, Rawdon, by a local company. The engineer is Mr. J. G. L. Stephenson, of London, the resident engineer being Mr. A. Powell, and the present contractors are Messrs. Whittaker Bros., of Horsforth. The cost will be about £50,000, and the line is eventually to be carried on from Rawdon, through Horsforth, to a junction with the North-Eastern system at Headingley.

Legal.

PUBLIC HEALTH FOR LONDON.

IT was clearly quite time the General Public Health Act came to be applied to London, as it was by the Public Health (London) Act, 1891, which has now been in force since the beginning of the present year. Up to this date the health of London has been so far under the care of the Metropolis Local Management Act, 1855, which, after being in force for 36 years, has just been found to be quite useless upon the great sanitary question of the removal of refuse from household dwellings. This discovery was made in the recent case of "Ellis v. Strand District Board of Works" (*Times*, 27 July) when the Court of Appeal reversed a ruling of Mr. Justice Grantham, holding the defendants liable in damages for neglecting or refusing to empty the plaintiff's dustbin. The Court so decided on the ground that this Act of 1855 only required the defendants to provide proper men to remove refuse, or to contract with some person for getting it done. It was shown that they had so contracted, and the Court held that in doing this they had fulfilled their obligation and complied with the law, leaving the contractor liable to the general public if he failed in carrying out his contract.

This reasoning looks sound from a purely technical standpoint, although it may be remarked that the Court of Appeal could just as easily have held both contractor and Board of Works responsible to the public for the breach of a public duty affecting the public health. However, fortunately the point is no longer of so much importance as it would otherwise have been, because the Public Health for London Act now cures the evil. Under that statute it is plainly provided that it shall be the duty of every sanitary authority to secure the due removal at proper periods of house refuse from premises, and the due cleansing and emptying of ashpits, &c., in their district, under penalty of a substantial fine. There is in this Act no loophole of escape as there was in the old one, by merely employing a contractor, who might, and who often did, fail to do his duty. The obligation is plainly thrown upon the local sanitary authority, and it cannot be shuffled off on to some one else. Besides this, it seems clear that the words "house refuse" in the section quoted cover all kinds of domestic refuse, and include such vegetable and mineral matter as compose the ordinary waste of a household, beyond mere dust and ashes.

FRED WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

A new bridge built over the river Frome at Longworth, Herefordshire, was inaugurated by Lady Emily Foley last week. It is of stone, and of one span. Mr. Stone was the contractor.

Some improvements in the engineering department of the Grand Hotel, Eastbourne, have been effected. The establishment had been fitted with two hydraulic lifts, worked by water purchased from the water company. There was also in existence a comprehensive steam service for heating, cooking, and laundry drying purposes, from which the whole of the water of condensation was allowed to run to waste. These two matters have been dealt with simultaneously, in the following manner. A steam pumping engine has been put down in combination with a large hydraulic accumulator, giving a pressure of 130lb. per square inch—i.e., equal to the maximum obtainable from the street mains—and from this the lifts are now supplied, the waste water being collected and continuously repumped. The whole of the condensed water from the steam service above referred to, as well as from the exhaust pipes of the laundry and pumping engines, is trapped, collected, and returned to a tank, from which it is pumped hot to the boiler. The net result of the double alteration is that the saving of coal resulting from the use of the hitherto wasted hot water has proved more than sufficient to compensate for the extra steam used by the pumping engine. There is, therefore, a positive reduction of coal consumption, while, on the other hand, all the water for the lifts and half the water for the boilers is obtained absolutely free of cost. The work has been carried out by Messrs. Archibald Smith and Stevens, of Battersea, who at the same time overhauled both the passenger lifts, and to a large extent reconstructed one of them.

LEGAL INTELLIGENCE.

EMPLOYERS' LIABILITY.—At the Brompton County Court, before Deputy-Judge Cooper-Wyld and a jury, W. Cramp, a labourer, sued to recover £100 damages under the Employers' Liability Act against Messrs. Cromwell, builders. The plaintiff, who was employed by the defendants in January last on some new buildings at Kensington-court, High-street, Kensington, was ordered by the defendants' foreman to hoist some rafters, and was supplied with a sling made of rope for that purpose. When half-way up some of the rafters slipped out of the sling, and the plaintiff, to escape the falling timber, jumped off the staging into an area below and broke his ankle. The plaintiff's contention was that there was a defect in the defendants' plant, in that the rope sling should have been made of iron chain, and that rope was not proper material for the purpose. Numerous witnesses were called on either side. The jury gave a verdict for the defendants, and found as a fact that a rope sling was not an improper material for the purpose.

ARBITRATION AT SALFORD.—Mr. Henry Wood, the arbitrator to whom was referred the question of the compensation to be paid to Messrs. Dewhurst and Co. by the Lancashire and Yorkshire Railway Company in respect of property in Salford required by that company for the purpose of widening, has issued his award. The property almost adjoins the Exchange Station, Salford, and consists of two five-story mills, one three-story warehouse, and 3,515 square yards of land, including cottages thereon. The witnesses on behalf of Messrs. Dewhurst and Co., Limited, valued the property at sums varying from £20,763 to £23,184, whilst the witnesses for the railway company valued the same property at from £7,000 to £7,430. The arbitrator has awarded £11,082.

PROPERTY IN BUILDING MATERIALS.—*THE QUEEN v. WALTERS.*—The Court for the Consideration of Crown Cases Reserved, consisting of the Lord Chief Justice, Lord Justice Smith, Mr. Baron Pollock, and Justices Cave and Bruce, had under review on Saturday, a sentence passed by the chairman of the West Kent Quarter Sessions on Albert Walters, a builder, for removing his own plant (poles, ladders, windows, and door-frames) from land which had been taken on a building lease, with power to the freeholder to re-enter, in the event of failure to carry out the covenants. The builder defaulted in some of the conditions, and before the freeholder had re-entered he removed his plant. For this he was convicted; but their Lordships unanimously quashed the conviction, pointing out that it was equivalent to convicting a man of stealing his own property.

A WORCESTER BUILDER CHARGED WITH ARSON.—At the Worcester City police-court on Friday, Ernest William Summer (25), builder, Sansome-place, and William Sampson, labourer, Friar-street, were charged with conspiring to set fire to a workshop in Bowling Green-terrace, the previous morning, with intent to defraud an insurance company. Summer was further charged with inciting Sampson to commit the act. The Chief Constable said that he and Inspector Wallace went at midnight to prisoner's premises and watched. He heard the door leading into the place open, and saw Summer, who was wearing stockings, carrying sand slippers in his hand, go to some timber and glance round. Witness jumped a wall, and, seizing Summer, asked him what he was doing. He said he was watching his yard, and he expected some of his men there at two o'clock. He learned it was Sampson he was waiting for, and as Sampson did not come, he took prisoner into custody. The shop smelt very strongly of paraffin, and a quantity of shavings were saturated. The woodwork in the shop was also saturated with paraffin. The charge against Sampson was withdrawn, in order that he might be called as a witness, and Summer was remanded for a week.

THE PURCHASE OF TRAMWAYS.—Sir Frederick Bramwell, C.E., sat again last week as arbitrator, with Mr. Phipson Beale, Q.C., as assessor, at the Surveyors' Institute, on the question raised between the London County Council and the London Street Tramways Company, as to the terms on which the Council shall take over the tramways of the Company, authorised by the Act of 1870, between Holloway and Euston-road and Camden Town to King's-cross. The Attorney General, for the Tramway Company, persisted in his contention that the arbitrator was bound, in assessing the value, to take into consideration the earnings of the tramway, but expressed his willingness to have a case stated for the decision of the Court, provided it raised the contention of both sides on the point of principle. After some discussion as to the manner in which the case should be framed, the arbitrator repeating that in his view earnings were entirely beside the question, the proceedings were adjourned *sine die*.

ANCIENT LIGHTS.—*NEWEN v. STEER.*—(Chancery Division, Aug. 2, before Mr. Justice Romer.)—This was an action to restrain the obstruction of ancient lights by the erection of an enormous block of

buildings, intended to be used as flats. The plaintiffs are the owners of the lease of, and live at, 42, Hyde Park-gate, Kensington-road. On the east and south sides of this house, which is only about 35ft. high, are a number of ancient lights, which, especially those on the east side, have suffered, as light transmitters, by the defendant's building operations. On the east side of Hyde Park-gate, and opposite the plaintiffs' house, the defendant had run up his pile of flats to the height of 60ft. His original plan to go up altogether about 90ft. was apparently frustrated by the plaintiffs obtaining an interim injunction. The principal question at the trial was whether the injunction should be enlarged into a mandatory injunction to pull down a portion of the obstructing building, or the plaintiffs should be merely recompensed by damages. Mr. Justice Romer held that the plaintiffs were entitled to £200 damages, and the costs of the action, and ordered part of the building to be taken down, the defendant undertaking not to further erect the buildings beyond a certain height.

ARBITRATION AS TO A SEWAGE FARM.—At St. George's Hall, Liverpool, Mr. Lewis Williams has recently presided over an inquiry with a view of ascertaining what compensation was due from the Walton Local Board to Mr. James Sergeant, farmer, Gill Moss, West Derby, in respect of the lease of land held by him of which the freehold has been acquired by the board for the purposes of a sewage farm. The farm, which consists of 73 acres, is held by Mr. Sergeant on a lease of 14 years from the West Derby Waste Land Commissioners, and of that period half is unexpired. The board purchased the freehold for £10,000, and offered to the tenant £2,100 as compensation for disturbance. Mr. Sergeant, however, claimed £7,500, of which £1,518 was set down as the difference between the rent of £73 lls. actually paid to the commissioners and the rack rent value, which was estimated at £300. It was shown, however, that Mr. Sergeant some time back appealed against a poor-law assessment of £300, and succeeded in obtaining a reduction to £224. Mr. Sergeant kept complete books showing that the annual profit for the past seven years was slightly more than £650. The jury, along with the assessor and the parties interested, first viewed the property at Gill Moss, and at the inquiry heard counsel and expert evidence on both sides. The jury awarded the claimant £3,090, to include all growing crops.

CHIPS.

The deaths of two well-known French artists are announced: M. F. Loewe-Marchant, the portrait and historical painter, who studied under Pils and Luminais; and F. S. Briest de Warville, whose landscape and animal studies have been frequently hung at the Salon since 1841. M. Briest de Warville was 74 years of age, and was a pupil of Léon Cogniet.

At Monday's meeting of the Scarborough town council, Dr. G. H. Monk, Underhall-road, Shrewsbury, was appointed medical officer of health for the borough, at a salary of £325 per annum. There were 41 applicants for the appointment.

The Pudsey local board adopted on Monday a sewerage scheme prepared by Mr. Spinks, C.E., and decided to buy for £1,140 ten acres of land at Hough Side for the treatment thereon of the sewage.

In the case of Frederick Rowbotham, late of Swindon and Manchester, now of Pendleton, Salford, late builder and contractor, now out of business, the discharge from bankruptcy has been suspended for two years, ending July 15, 1894, but leave has been given to apply again.

A special meeting of the Dundee Gas Commission was held on Monday for the purpose of appointing an electrical engineer for the electric-lighting works in course of construction. There were 53 applicants for the appointment, and Mr. W. H. Brownlee, of Glasgow, was appointed at a salary of £200 a year.

A new borough is about to be created on Teeside, the district hitherto known as South Stockton, and governed by a local board, having obtained incorporation under the name of Thornaby-on-Tees. It is situated on the Yorkshire bank of the Tees, is virtually a suburb of Stockton, and has a population of 17,000.

On Tuesday week the chairman of the general purposes committee of the Lambeth vestry unveiled the fountain which, mainly through the liberality of Sir Henry Doulton, has been erected in the Vauxhall Park. The fountain is of granite or Doulton ware, and is worth over £300. The cost of it has been defrayed by £70, the balance in the hands of the vestry for the materials of the old Carroun House, and the difference in price has been given by Sir Henry Doulton. A replica of the fountain will be exhibited at the Chicago Exhibition.

WATER SUPPLY AND SANITARY MATTERS.

THE BIRMINGHAM WATER SUPPLY.—After a long discussion last week, the Birmingham City Council approved the report of the Water Committee, reciting the measures which had been taken for obtaining Parliamentary powers for the proposed water supply from Wales, and asking for authority to acquire the necessary land and to carry the scheme into effect. The Water Committee state that the gravest difficulties they had to encounter arose—first, on the questions raised by the County Councils of London, Glamorgan, and Monmouth; and, secondly, on the mode of dealing with the land question. As to the first point, the opponents, who entirely agreed as to the excellence of the source of supply, strongly urged that Birmingham should not be allowed to appropriate it until a general scheme should have been arranged for the division of the remaining watersheds amongst the communities most in need of them, or, at all events, until the Royal Commission now sitting on the subject of the metropolitan water supply should have presented their report. In reply to this contention, the counsel for the corporation were able to point out that this identical question had been raised 25 years ago, and had formed part of the matters submitted to the Commission appointed in 1866; that the Commission had found the matter too vast for them to deal with in reasonable time, and had, therefore, limited their report upon it to the laying down of a few general principles; and, further, that the point had also been raised at the time when the corporation of Liverpool obtained powers for the Vyrnwy scheme. Strong as these arguments were, however, they would not have prevailed if the water committee had not been able to establish an overwhelming case of urgency for an immediate supply for Birmingham. The committee asked the council to authorise them to proceed with all steps necessary for the completion of the purchases already made for acquiring the remaining land and easements which would be necessary for the works, for obtaining all professional assistance that would be required for the engineering and other work, and generally for carrying out the scheme, reporting, of course, to the council from time to time. The resolution was ultimately carried by a unanimous vote, and the council voted an *honorarium* of 1,000 guineas to the town clerk, Mr. Orford Smith, in recognition of his services in connection with the passing of the Bill.

BLACKBURN.—The Blackburn borough engineer on Saturday reported that the expenditure of £170,000 was necessary to provide adequate water supply for the borough in future. He advocated the construction of a new reservoir in Brenand Valley at a cost of £85,000, and an additional storage and improved plant at the existing works, to cost as much more; the old waterworks at Daisy Green and Pickup Bank to be reserved solely for trade purposes.

BUCKHAVEN, N.B.—The Police Commissioners of Buckhaven, Methil, and Innerleven are about to carry out a drainage scheme which will bring the old-fashioned fishing village of Buckhaven into harmony with modern sanitary requirements. The cost of the scheme is estimated at between £3,000 and £4,000. Its main feature, as laid before the commissioners on Monday by their engineer, Mr. Robert Henderson, C.E., Burntisland, is the construction of an intercepting sewer from the east end of Buckhaven to near the railway station, and the sewage of the whole of Buckhaven will then be discharged by an outlet at the east end of the village at low-water mark, as the tide falls. The east outlet is to be of cast iron and 22in. drain-pipes, and another outlet will be 18in. drain cast-iron pipes. The ventilation of the sewers is effected by means of manhole gratings and ventilating tubes, and a large number of the former have been provided for inspection purposes. Means have been taken also for flushing the pipes by mine water from a colliery.

CRIEFF WATER SUPPLY EXTENSION.—A large extension of the water supply from Loch Turret to Crieff has just been completed. When water was first introduced from the loch to the town, in 1872, the pipes were almost wholly 4in. to 5in. tile ones. Since then, however, these have from time to time been lifted and cast-iron ones of a larger diameter substituted, the latest extension of this improvement just completed being the laying down of a 9in. iron pipe through Glenturret, a distance of 3,900 yards, and which has cost about £1,900. Sir P. K. Murray, who is the superior of the loch, and who originally granted the use of the water free for all time, again has allowed the town council to raise the height of the dam-dyke at the outlet of the loch, in order to add to its storage capacity; so that now an additional supply of water to the extent of about 48 million gallons is available for the town. The whole track from the loch to Crieff (a distance of six miles) is now laid with iron pipes 9in. to 10in. in diameter.

GRIMSBY.—A meeting of the Public Works and Drainage Committee was held last week to meet Mr. G. W. Lawes, M.I.C.E., city engineer, of Newcastle-on-Tyne, and Mr. F. W. Lacey, A.M.I.C.E., borough engineer, of Bournemouth, who had reported to the corporation upon the proposed new drainage scheme for the town. The chairman said the subject was divided into three divisions, viz., the drainage, the flushing, and the salt-water supply. There were two difficulties from which they suffered in Grimsby, the one being from the water lying in the drains when the tide was up, causing the drains to be full of water and the land saturated with sewage; and the other arising from the fact that owing to the town being so flat there was a great deposit of sediment in the drains. The report first dealt with the necessity for a pumping station, the second point was that they should have a suitable plant for the purpose of thoroughly flushing the drains by means of salt water. The printed reports were then gone through, and the opinion of the reporting engineers was asked upon points which arose in them, when Mr. Lawes and Mr. Lacey explained the reasons which had weighed with them in arriving at the conclusions set forth in the reports. They recommended a scheme of drainage which, if carried out, should not only relieve the sewers from being tide-locked for many hours but give a surface drainage to the district of between 2ft. and 3ft. throughout, and as a result ought to favour the district from two to three points in the death-rate of the town. The salt-water scheme for drawing water from the Humber for flushing sewers and for street watering, with its water tower, which had been specially reported upon by Mr. Lacey, was then dealt with. A discussion took place upon the relative advantages of fresh and salt water for flushing purposes and for street watering, Mr. Lacey thinking the salt water much more preferable for street watering. It was estimated that the cost of the water provided according to the scheme would be 2d. per 1,000 gallons as against 1s. per 1,000 gallons charged by the waterworks company.

RICHMOND, SURREY.—The Richmond Main Sewerage Board are perplexed as to the means of ventilating their new system of sewers, recently completed at a cost of over £100,000. The destructor system is employed, whereby the sewage gas passes up an iron pillar, usually a gas lamp, and is supposed to be consumed by coal gas at the foot of the pillar. But the draught is frequently sufficient to put out the lighted gas, which thus escapes into the air, and, fearing that explosions may occur, the Richmond Gas Company refuse any longer to supply gas to the destructors. At this very juncture, owing to the complaints as to the offensive smell emitted from the manholes, the Main Sewerage Board are closing all these ventilators, so that the only means of ventilation will be by the sewer gas forcing its way up the drains into the houses.

It is announced that M. Monchicourt, the liquidator, has signed a convention with a financial and technical group for the resumption of the works of the Panama Canal. That group is composed chiefly of former contractors for the Panama Canal works, who are interested in the completion of the canal.

We briefly announced last week the death of the late county surveyor for Hereford, Mr. William Cheiako, of Aylestone-hill, Hereford. Mr. Cheiako, who was born in 1829, commenced his professional studies in 1849 at Guildford, Surrey, and in London; and was engaged in the office of the late Mr. H. Woodyer and Sir G. G. Scott. He was elected county surveyor of Hereford in 1861, and continued to hold the office until the beginning of the present year, when failing health compelled him to resign.

On Tuesday week the formal dedication and handing over of a library and free school which has been built, furnished, and endowed at the sole expense of Mr. Robinson Gill, stone merchant, of New York, took place at Askwith, near Otley, Yorks. The building, which has been erected from designs by Mr. A. Marshall, of Otley, is 43ft. by 31ft. 6in. The front rooms consist of entrance-hall, library, and committee-room. To the back is a lecture-hall, which can be divided by a movable partition into two rooms.

Queen Wilhelmina and her mother, the Queen Regent, visited Amsterdam on Thursday in last week to open the first and most important part of the new Merwede Canal, which affords direct communication for large vessels between Amsterdam and the Rhine. The section thus opened is 28 miles long, and the whole canal when complete will have a length of 43½ miles. The canal, after leaving Amsterdam, crosses the Leyden Rhine, passes Utrecht, and enters the Leek near Vreeswyk, where for the present it ends. The second portion, which is still under construction, commences at Vianen, opposite Vreeswyk, and finally enters the Merwede, one of the branches of the Maas and Waal Delta, from which the new waterway takes its name, a little below Gorinchem. The average breadth is over 100ft., and the depth 10½ft.

Our Office Table.

THE National Association of Master Builders of Great Britain have issued two statements as to the condition of trade—the one in tabular form showing the present state of the labour market, the other a comparative list of the hours worked per week, and the rate of wages per hour, in the various branches of the building trade throughout the United Kingdom. Both reports are brought down to the 1st July, and were prepared by the secretary, Mr. W. Knox, of Liverpool, for presentation at the recent half-yearly meeting of the National Association, held at Newcastle-on-Tyne, and reported on p. 211. The reports as to the state of trade vary, but are, generally speaking, satisfactory, except on the south-east coast, in South Yorkshire, and parts of Lancashire and Cheshire. The hours worked and the rates of wages differ greatly in various districts, and also in individual trades. Masons, for example, range in working time from 47 hours at Altrincham to 61 at Croydon and Lewes, and 61½ at Brighton, and the hourly wages from 5½d. in small towns to 9½d. in London, the provincial average being 8d. For bricklayers and carpenters the hours and wages range in similar manner, the longest being at Brighton and Lewes in each case.

BRIXTON parish church (St. Matthew's) is undergoing the reconstruction of its roof, which we believe was found in a rather decayed condition. New iron principals or trusses are being erected in place of the old timber ones. These are on the lattice or braced system, and are being put together in sections by Messrs. Matth. T. Shaw and Sons, who are the contractors for the ironwork. The work of restoration is proceeding under a temporary tarpaulin roof, which has been placed a working distance over the old roof, and to the same inclination as the old rafters. It may be mentioned that St. Matthew's stands at the junction of Brixton and Tulse Hill-roads, and is one of several Grecian Doric churches erected early in the present century from the designs of Mr. Porden, and consecrated in 1824. The portico is a Doric hexastyle, and at the east end, over the chancel recess, rises the tower with octagonal termination, said to be a copy of the temple of Cyrrhists at Athens.

A GLASGOW architect writes to point out the serious disadvantages under which Scottish architects' pupils labour. Architecture is, he says, the only "business" in which the apprentices work for five years without remuneration, and in some cases have, on the other hand, the privilege of paying a premium. In addition to that, of late years they have been expected to prepare for three successive examinations, involving work enough to occupy all the youths' time, while there are no classes corresponding to those existing in England at which instruction can be gained, and indeed at present there is no body in Scotland capable of organising fresh educational facilities. Heads:—"What Scotland requires is a purely Scotch Institute, a Scotch architectural degree, and classes properly organised in its principal centres. What its apprentices require is (1) time to attend these classes, and the extension of their holidays, so as to enable them to cover the outdoor study required; and (2) salaries from the third year of their apprenticeship, and overtime paid all through."

THE United States House of Representatives has passed without demur a Bill for throwing open the designing of the public buildings to the architects of the country, under certain restrictions, to be imposed by the Secretary of the Treasury. The measure, which was reported unanimously from the Committee on Public Buildings and Grounds, with a strong recommendation in its favour, has yet to be passed by the Senate and approved by the President before it can become a law; but although it is likely that no final action will be taken during the remainder of the present session, another year will probably see it, possibly with some modification, enacted into a statute. The opinions of the Members of Congress, and of the newspapers, seem to be nearly, or quite, unanimous in favour of the new arrangement. The day when architects and architectural designs were looked upon as useless luxuries, unworthy the attention of a "practical" government, which could be better

served by an astute mechanic, appears to have gone by in the United States.

A LARGE scheme of improvements is at present being carried out at the Royal Botanic Gardens and Arboretum, Edinburgh, which will have the effect of increasing their efficiency as teaching institutions, and making them serve as the Kew of the northern capital. Dating from 1670, the Botanic Gardens were removed from Holyrood to Inverleith in 1822; the new gardens have been successively enlarged in 1858, in 1865, and in 1877, and now extend to sixty acres. They are maintained by the Crown as a national institution, and the works in progress at present, at a cost of £8,000, include the welding of the Arboretum and Gardens into unity by the removal of a high wall which still divides the properties, and the making of cross-walks and paths, and in extensive alterations to the palm-houses and greenhouses, so as to bring up to modern requirements. A modern system of heating by hot water is to be introduced into these houses by Messrs. Mackenzie and Moncur, of Edinburgh.

CHIPS.

The parish church of Bourton-on-the-Water is about to be re-seated in pitch-pine and restored. Mr. George Poole, of Bourton-on-the-Hill, is the contractor.

The town council of Bournemouth have adopted plans by Mr. F. E. Robinson for extending the pier and erecting on the seaward end a pavilion. The estimated cost is £22,000.

The town council of Walsall have received 28 tenders for lighting the streets with electricity, these ranging from £6,712 to £22,733. A committee has been instructed to visit half a dozen towns where an electric-lighting installation has been adopted before accepting any tender.

At the meeting on Monday of the Gainsborough local board the chairman announced his intention of presenting to the town the new clock which has been ordered for the new market buildings from Messrs. Potts and Sons, of Leeds, at a cost of £85. He regretted that the structure of the building did not permit of the chimneys being added. The offer was accepted with thanks.

An inquest was held on Friday at Liverpool on the body of John Donnelly, a bricklayer, aged 23, who was killed on the previous day while working at the Atlas Warehouses in Love-lane, in that city, which are being rebuilt after their destruction by fire. He was working on an internal scaffold about 44ft. from the ground, setting an arch over a window. He was seen to stand on the wooden centre-piece of the window, and was warned that it was not meant to bear his weight, but only to carry the centre of the arch. He took no notice of the warning, and it gave way, and he sustained a fracture of the base of the skull. Verdict, "Accidental death."

The death is announced of Mr. Thomas Fletcher Hill, builder, of Woolton, near Liverpool. Deceased, who was 46 years of age, took a prominent part in public affairs in Wootton, being chairman of the gas company, and a member of the local board. He leaves a widow and ten children.

The vestry of St. Pancras has decided to build new municipal buildings on the vacant site at the south-east corner of Great College-street, Camden Town, and the Works Committee has been instructed by the vestry to obtain plans. The existing vestry hall buildings in King's-road, which are inadequate for the purpose to which they are at present devoted, are to be pulled down, and the site utilised for an extension of the workhouse.

In the bankruptcy case of John How, of St. James's-street, Walthamstow, builder, the discharge has been suspended for three years, ending June 23, 1895.

The memorial stone of the western extension and tower of the district church of All Saints, Norwich-road, Ipswich, was laid on Wednesday week. The works now in hand will complete the church, which has been built since 1887, from plans by Mr. S. Wright, of Morecambe, selected in competition. The western extension will raise the accommodation from 500 to 800 sittings, and will cost £3,000. Messrs. Grimwood, of Ipswich and Sudbury, are the contractors.

A full-length subscription portrait of Sir John Harwood was presented to the Mayor and Corporation of Manchester last week to be placed in the State apartments of the building. The portrait has been painted by Mr. H. T. Manns, of Birmingham. A local journal mentions in connection with the presentation that Sir John Harwood came to Manchester in 1853, at the age of 21, and worked for several years in the city as a journeyman painter and plasterer.

Trade News.

WAGES MOVEMENTS.

THE RECENT CARPENTERS' STRIKE.—The balance sheet of the eight hours' committee on the building trade, dealing with the strike in the building trade last year for an eight hours' working day, was issued on Wednesday by the strike committee. The agitation for shorter hours of labour and increased rates of pay culminated on May 2, 1891, in a strike of the men at three of the largest London firms. This was followed by a general lock-out on the part of the masters' association and a strike of the men employed by 90 firms not connected with that association. Of these 50 conceded the men's demands pending the final settlement of the dispute, and the men resumed work on the terms asked for—namely, 47 hours a week and 10d. per hour. Altogether the strike affected 218 firms and 5,000 men. After a struggle lasting over several months, the dispute was, it will be remembered, referred to Mr. J. MacVicar Anderson, F.R.I.B.A., who gave his award on November 19, reducing the hours of labour to 47 in winter and 51½ in summer, without any increase of pay. The balance-sheet showed a total income of £26,959, and an expenditure of £26,771. The income was made up of levies on the trade in London, including trade subscriptions. The provincial levies amounted to £15,813, including Ireland and Scotland £4,768 2s. America and colonial subscription £130, and grant from other trades £3,937. The expenditure consisted of strike pay, £23,571; committee's salaries and other expenses, £1,452; legal expenses, £283; and printing and stationery, £193. This excludes the amount expended by the various carpenters' and joiners' societies, amounting to upwards of £20,000.

AMALGAMATED SOCIETY OF CARPENTERS AND JOINERS.—The report for August states that four new branches of the society have been opened at Acton, Colne, Llanely, and Wanstead. Considerable progress has been made in the welfare of members in the south-western counties. In Falmouth and Penryn the members, co-operating with the other trades, have succeeded in establishing the hour system instead of the day, leaving work at 5.30 p.m. instead of 6 p.m., and also the Saturday half-holiday. In Exeter a half-penny per hour advance has been secured, with shorter hours for the winter months and extra remuneration for overtime. Gainsborough, Huddersfield, Waterford, and Grays each report that increased wages have been obtained.

THE AMALGAMATED UNION OF BUILDERS' LABOURERS.—The third annual convention of the Amalgamated Builders' Union of Great Britain and Ireland was held last week at the Volunteer Inn, St. Peter's-street, Leeds. Mr. John Judge (president of the Leeds branch) in the chair. The following towns were represented:—Leeds, Bradford, Shipley, Hull, Sheffield, Rotherham, Castleford, Nelson, York, Barnsley, Grimsby, Morley, Wakefield, and Doncaster. The delegates represented 16,000 members. It was agreed that Leeds should be the central branch of the union. The following officers were appointed:—Mr. J. Judge, president; Mr. J. Nolan, secretary to the conference; Mr. H. Hart, corresponding secretary for the next twelve months; Mr. P. Lowrey, corresponding secretary pro tem.

ROCHDALE.—The plasterers are on strike in this town for an advance of ½d. per hour—from 8d. to 8½d.—and a revision of the working rules.

The Lords of the Admiralty have again awarded the United Asbestos Company (Limited) the contract for the supply of all asbestos goods required in the Royal Navy during the ensuing twelve months, the principal articles being "Victor" block packing, "Victor" metallic packing, and hard-spun yarn packing for glands; "Victor" metallic sheeting, tape, rings, ovals, &c., for steam and hydraulic joints; asbestos millboard, asbestos tape, covering for steam pipes, &c.

The new church of the Redemptorist Fathers at St. Joseph's, Dundalk, was dedicated by the Most Rev. Dr. Logue, R.C. Archbishop of Armagh, and Primate of all Ireland, on Sunday.

A new Cambridge quarter-clock, showing the time upon three 7ft. copper disks, with all the latest improvements inserted, has just been set going at St. Paul's Church, Alnwick, Northumberland. The work has been carried out by Messrs. W. Potts and Sons, clock manufacturers, Guildford-street and Cookridge-street, Leeds.

Alterations have been made to the Guildhall School of Music, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the Self-acting Air-pump Ventilator being adopted for the extraction of the vitiated air, and fresh air admitted by their improved air-inlets.

ARCHITECTURAL TOURISTS.

THE annual holidays have come round, and architects and students are either engaged in making pleasure tours, or are trying to combine the convivialities of social intercourse with just as much sketching and photography as will serve to show something for the time and costs of the journey. In these days of easy transit by railway and steamboat, guide-books and publications, excursions are beginning to fall rather flat—or perhaps we ought to say, the greater facilities have rather reduced the keen relish there once was for exploring architectural antiquities. On the other hand, a larger number of persons avail themselves of the yearly tour, and a greater variety of minds are employed in the work of exploration. How these excursions may be made practically useful as well as entertaining, is a matter for inquiry. After drawings, specifications, or quantities, the mind demands a period of repose once at least in the year. But recreation is not merely relaxation of body and mind, but a fresh storing up of the energy required in everyday work, the re-creation of new stimuli. Who has not felt the expenditure of mental energy due to prolonged labour on one large building? The artistic mind gets exhausted of its store of ideas in preparing detail after detail; the draughtsman constantly wielding his pencil falls into a mannered style of drawing, and the designer is apt to revolve upon himself if he is not taken out of the groove of his own making.

As a means of instruction, the holidays afford ceaseless opportunities, if they are properly directed. It is not the guide-book idea of a holiday tour that is of much value: it may be of use in directing where buildings and other objects are to be seen, and in economising time by instructing in the topography of the locality; but there it ends—it does not supply brains. It is rather going fully prepared to discover the peculiarities of each building or object that is presented to our view, to note distinguishing features, whether of the geological formation of a district, its fauna or flora, or those of the architecture. Even in the forest we may glean something from the soil and the character of the trees—the mode of cottage construction; the seaside resort may afford interest in rocks and beach, and the class of its buildings; an agricultural district, in the planning and construction of its homesteads. As the ornamentist may find some plant or leaf from which he may abstract beauty, so the architectural student will take care to notice and examine any peculiarity of structure or treatment of material that he can adapt to his use—not merely in the style of the architecture, but in the plan, the mode of construction and execution, and the detail. And the art of doing this efficiently is what is most needed in the architect's travel. The sketchbook has its value if, in addition to perspective sketches, it contains sketches of details and measured plans that may lead to useful comparisons being made. But the facile artist is apt to be more intent to fill his pages with examples than to detect beauties of design or methods of workmanship. With the aid of the camera the examination and analysis of old buildings might certainly be more pursued. Notes might be made to supplement the photograph or sketch, and these ought to be directed to such points as plan, the materials used, whether brick, stone, or wood, the

jointing and details of masonry and carpentry.

What infinite diversity of design may be found in study, for example, of towers and spires! From careful observations and slight sketches the architectural student may, for instance, compare the peculiarities of the construction and plan of the towers of Somersetshire and East Anglia. The angle design of the buttresses and pinnacles, and the methods adopted in tapering are alone worth the special attention of the tourist in Somersetshire, and he may attack this peculiarity as found in such examples of towers as those of Wrington, Evercreech, and Huish Episcopi, relying on photographs for general views. Especially to be observed is the way in which the builders of those fine Perpendicular towers managed to set in the angle of the tower, and to poise the upper tier of buttresses on those below. Sometimes they are set diagonally on the lower buttresses, and joined by webs of masonry to the tower, or form engaged pinnacles on the upper stage, as at St. Mary's, Taunton. The corbelled pinnacle, so conspicuous also here and at Huish, and the manner of finishing the angle of tower so as to give a batter, are points of masonry which are worth study, as well as are the numerous kinds of parapet and angle turret. In spire construction, the methods of jointing and springing are little known, and would repay study. Attention hitherto has been chiefly bestowed on general characteristics, such as tracery. Roof construction, as we see it in old churches, has not by any means been exhausted. We have only had general views and drawings, but no reliable information as to the framing or the timberused. Stone vaulting is equally worthy of attention. Access to the parts we have mentioned is not easily obtained; but when a party of students make a visit, it would not be difficult to obtain permission to examine. A ladder would be generally all that was required. But this probably is not the young gentleman's idea of making a holiday: it would mean disarranging his attire or spoiling his hat. However, we repeat that a knowledge of methods and detail is much more valuable than an ordinary unmeasured sketch.

There are many things that can be learned without the ladder or the measuring rod. A knowledge of the materials of the district—notably, the building stone and its state of preservation in the older edifices, is one of great practical importance to the architect. His general geological acquaintance could be greatly extended, and made more practical if in every visit he made he did not neglect to note the local use of any particular limestone or sandstone, its bed, colour, state of preservation, and other qualities. To the lithologists the buildings of a certain locality have a special value apart from its architecture, and if the young architect had a general knowledge of the particular sandstone or limestone of the county he visits, he would have a much wider and more complete knowledge of the architectural development of that district, because he can appreciate and understand why the old masons used certain sections and details in preference to others—why, in fact, the architecture of Yorkshire and Northamptonshire differs from that of Somersetshire; why the style of the ecclesiastical structures of the West of England is richer in detail and sculpturing than that of the North or East. An acquaintance with such a formation as the Great or Bath Oolite, and its upper and lower zones, how its character alters from a freestone into a flagstone, gives the tourist an instructive clue to many peculiarities of local building met with in Oxfordshire, Northamptonshire, and Lincolnshire. The petrological peculiarities of the building stones is also a point of

interest. Distinct bands are noticeable, as in the oolites, of which there are recognised four formations, and as these rocks cross the country from the Dorsetshire to the Yorkshire coast, some of the more important architectural districts are influenced thereby. Observations on the decay of building stones in the older edifices are of special value. These can easily be made, and ought to have reference to those portions of buildings which have most suffered the effect of smoke and other acids, and in what manner the decay proceeds—whether by disintegration or exfoliation. There are other ways in which local information may be of value to the architect, and which he can obtain in no other way than by travel. Reports and published results of the most durable stones are unreliable for many obvious reasons: they cannot be tested personally, the particular beds from which they have been quarried are no longer available. Many stones which have resisted the atmosphere are little known or have escaped notice. Landscape scenery in its relation to architecture, roof coverings, and features of building that give each locality a special character of its own, and many other things which go to make up the local colouring of a place, are matters which escape the ordinary guide-book compilers, but are just those which make travel one of the most potent factors in the education of the architect.

THEATRES.—V.

By ERNEST A. E. WOODROW, A.R.I.B.A.

IT is easily conceived that for the requirements of a theatre, it is not sufficient to overcome the difficulty of obtaining an uninterrupted view of the stage for each spectator; but, it is also necessary for all that is said or sung to be heard with ease in every part of the auditorium, in order that the slightest variation and modulation of the actor's voice may not be lost to the nearest occupant of the stalls or the farthest spectator in the gallery.

The science of acoustics, especially in relation to theatres, seems to be but little understood, and success or failure in the properties of the auditorium is never absolutely assured. M. Charles Garnier, architect of the Grand Opera House of Paris, in concluding a discourse on the science of acoustics in relation to theatres, remarks that the results are but chances. I must, however, differ from the views thus expressed, even by so great an authority, for I believe that there are certain fundamental rules which it is most necessary to observe in order to obtain a building in which it is easy to hear in, speak in, and sing in, more especially such rules as relate to proportion and the employment of suitable materials.

Saunders, writing on the subject of theatres,

FIG. 1.

relates in full the results of certain experiments made by him with the human voice. Having traced a circle of 100ft. in diameter, he placed the speaker in the centre. The hearer moving on the circumference of this circle heard most distinctly when in front of the speaker, not much less so at the sides, but scarcely at all behind (Fig. 1). The speaker was then placed 25ft. from the centre or three-fourths of the diameter, or 75ft. to the front and 25ft. behind. He was heard best at the sides at CC (Fig. 1), and indifferently in front and behind.

On repeating the experiments, and changing

the situation of the speaker, it was found that the voice reached the circumference most equally when he was placed 17ft. from the centre (Fig. 2). The voice was next traced the extreme distance at which it could be distinctly heard every way, and the line formed was that described in Fig. 2. The situation of the speaker was at A,

Fig. 2.

from which point B, the centre of the circle, was at the distance of 17ft. in front. The distance from speaker to hearer was 92ft. in front, 75ft. on each side, and 31ft. behind. These experiments were tried on a calm day in the open air, where the sound-waves would die away gradually from friction with the surrounding air. When sound is confined within the limits of a building, experience teaches that the dimensions given above would be too far for the human voice to reach, without considerable effort. The same writer advises that with regard to the size of a theatre, it would not be advisable to have a greater distance than 60ft. from the stage to the farthest spectator on a level with the speaker. Speaking of the height, he asserts that the proportioned height appears to be three-quarters of the diameter. Supposing the diameter to be 60ft., it will follow that the height should be 45ft. from the level of the stage, which height includes all the visual rays within the angle of 45° .

The difference of the sound made by the voice and that made by a fixed sound is evidently occasioned by the voice being pushed forward from the mouth, and the difference is always in proportion to the exertion of the speaker.

With regard to the ascension and descension of the human voice, allowing the difference of the density of the air at the top and bottom, it has been ascertained that it may reasonably be concluded that could the air be found of the same medium throughout, sound would expand equally every way, and form a perfect sphere. In the experiments which I am now quoting, it was found that the proper distance for distinct hearing was nearly the same in a long narrow room or passage as in a large square room. In making this assertion, the writer remarks that it must not be supposed that it is the same in long narrow tubes which have a small bore proportioned to the volley of air issuing from the lungs through the mouth, for it will be equally affected at the end by the displacement of so much air.

The delicate nature of the sound-waves created by the human voice requires a direct and free passage, for a trifling circumstance will check it in its progress; the lightness of the air and gentle impulsion occasioned by the voice will account for its not travelling readily round any obstacle: the time necessary for its arrival gives opportunity for its being destroyed. As any solid obstacle will divert the progress of the sound-wave, so will currents of air affect its direction; therefore in scheming the ventilation of the theatre, it must be remembered that the sound varies in proportion to the density of the air. The direction of the ventilation should be the same as that in which it is desired that the voice should travel. Some doubt has arisen in my mind as to the injurious effect upon the acoustic qualities of the theatre that must be brought about, by the employment of large exhaust ventilators over the stage roof, for if they are made to act as a strong up-draught through the stage, the current of air must tend to divert the direction, and greatly weaken, the sound-

Fig. 3.

S, stage; O, orchestra; V, vestibule; G, seats; L, boxes; E, entrances.

Fig. 4.

waves issuing from the mouth of the actor facing the audience. The ventilation of the auditorium by the sun burner in the ceiling or "dome" has always assisted the sound to travel upwards towards the gallery. As sound does not travel against the current, a ventilation from the auditorium through the stage must be fatal to sound.

Sound, as is well-known, travels in waves in all directions, like the wave created by dropping a stone in water, and when these waves are created in the open air they die away naturally as they become worn out by the friction with the atmosphere; but when they are confined within a limited space by walls, floors, and ceilings, they are reflected in various degrees in accordance with the substance of which such walls, &c., are made.

Materials, therefore, quite as much as form, play an important part in the perfection of the acoustic properties of the auditorium—a part equal in magnitude to the size, shape, and siting of a house. In a theatre the materials demanded by the absolute necessity for creating a fireproof building, contend with the materials which have generally been accepted as desirable for the acoustic qualities of such a building. The architect may experience some difficulty in providing a fireproof building which will possess qualities of acoustic excellence.

It has rightly been observed that we must at all times distinguish between the house designed for the performance of music only and that for the representation of the dramatic art. In the former case a certain amount of resonance is necessary, while in the latter it is all important that the words of the actor should be clear and distinct. The experience gathered from the recently-built so-called fireproof theatres teaches us that if the materials used are not so porous, as to absorb the sound to a large extent, certain forms of fireproof construction are acceptable in houses erected for the drama. Concrete formed of breeze or ground ballast appears to have a certain amount of elasticity, and does not possess the reflecting qualities of denser materials—an echo is not, therefore, produced. Concrete and plaster possess a power of absorption of sound, and fulfil conditions deemed necessary by a French writer on this subject—M. Lachéz—who claims that sound should be killed on the ceilings, box fronts, and walls, and for this reason he considers solid construction more desirable than wooden construction by which the sound would be reinforced. In fireproof buildings there is little difficulty in securing a homogeneous character, and obtaining that amount of vibration, elasticity, resonance, and sympathy between the materials and the sound-waves which are requisite for a

FIG. 5.

theatre of the limited size required by managers of modern times.

One cannot pass away from the consideration of materials in relation to sound without referring to opinions which have been expressed from time to time, as to the desirability of using wood for improving sound in theatres. One writer, who certainly had not the opportunity of gaining the experience we have obtained of late years from the modern theatres, says that wood being of all materials the most favourable to sound, should be adopted in a theatre in preference to every other, not only in the divisions, but the walls, and even the ceiling should be lined with it, care being taken to leave sufficient room behind not to hurt the elastic property of the boards; they should be united in a most artful manner, and the bearers placed at the greatest possible distance. Wood, it has been stated, is the proper material to choose in order to augment the energy of sound in a room adapted for music. M. Lachéz, however, has expressed a very different opinion, and I believe his theory as regards theatres constructed of fireproof materials has proved to be the right one.

Woollen materials are prejudicial to sound, as they absorb it to a great extent, as all materials do which will absorb water. For this reason, a number of persons seated in any part of a theatre prevent the voice reaching those behind, and hence it is we hear better in the front row of the galleries than in other situations which may be nearer the stage, but behind other persons. If the seats of the modern theatre rose clear above each other, as in the ancient theatres, or as in Mr. Wagner's theatre in Bayreuth, this difficulty would be overcome.

In buildings devoted exclusively to music and opera, it is most desirable not to allow the circles to advance too far into the auditorium, to prevent the sound-waves being broken up against the projecting box-fronts. The abolition of columns, which the recent improvement in the construction of theatres has permitted, has done much to improve the acoustic qualities of the theatre. Columns acted as obstructions to the sound-waves, breaking them up, and scattering them in different directions. High partitions dividing the various sections of the audience are bad, as they form a hindrance to the free passage of sound. To inclose the orchestra within, as it were, a ditch, partly buried under the stage, is a self-evident error. The orchestra should only be divided from the audience by an open railing or posts with cord. In America, in Madison-square

Theatre, I believe, the orchestra was placed over the proscenium arch; this proved a failure, for the sound was heard but indistinctly by those below it.

Richard Wagner, the great composer, has designed his own theatre at Bayreuth, a diagram of which I extract from M. Gosset's treatise on the Construction of Theatres. (Fig. 3.) In this house the auditorium is narrowed towards the stage, columns are avoided, and there are no overhanging balconies, the "parterre" sloping rapidly towards the boxes in the rear. There are no stage boxes in this theatre, and there is no doubt that they are always prejudicial to sound.

In the accompanying diagram, which appears in M. Gosset's work on Theatres, was prepared by MM. Davioud and Bourdais in 1875 as a project for a popular opera-house for 9,000 people, with a view to explain their principles of acoustics, it will be observed that there is a large cove over the proscenium, and the stage advances a considerable distance into the auditorium to allow the singers to sing among the audience. The orchestra is spread over a large area. The cove and curved wall at the back of the stage do not appear to me to be of much use, as the scenery and flats which must be placed before them, would naturally destroy all possibility of sound being reflected or enforced by these surfaces.

As shown in MM. Davioud and Bourdais's scheme, the ceiling forms an important function in perfecting the sound qualities of the house. Frequently an auditorium is made too high, and still more frequently the gallery is carried far above the auditorium ceiling. A ceiling sloping upward from the proscenium arch towards the gallery was adopted by Mr. D'Oyly Carte in the New English Opera House, and there is no doubt this form of ceiling is admirable, as it does not hinder the sound-waves travelling upwards to the gallery.

Closely associated with the question of sound is the equally important question of sighting to be dealt with in the next chapter; but before leaving this point, I must remark that of the two forms which I have borrowed for illustrations, that of MM. Davioud and Bourdais show a serious defect, as several of the audience would obtain from the sides little or no view of the stage. These two illustrations show the two extreme examples of the form of auditorium adaptable to modern requirement; but as is well known, horseshoe and prolonged circles of various forms and curves are

more common nowadays, and prove excellent from an acoustic point of view.

Whatever shape the architect may adopt, one thing is certain: he must clothe his theatre in a form agreeable to the eye as well as to the ear; it is also certain that the hard, smooth surfaces of a fireproof building do not prevent the architect from providing a house that is good to hear in. No doubt the upholsterer materially assists with his box hanging and stuffed chairs to prevent the sound being too harsh, and the audience themselves play an important part in the perfection of the acoustic qualities of a fireproof building.

THE ARCHITECTURAL ASSOCIATION EXCURSION.—II.

[WITH ILLUSTRATIONS.]

THE weather was all that could be desired at the start of these proceedings on Monday, when the excursionists began the programme with Bishop's Hull, which is quite close to Taunton. The manor-house is an E-shaped building hard by the roadside, plain enough in general style, which is of a Jacobean kind, with mullioned windows and a good entrance porch, flanked by fluted columns. Upstairs there is a panelled room having a shield-carved frieze round the apartment, which really is suggestive. The church close by has an octagonal tower after the type of Somerton in the same county, and of smaller dimensions. The hideous nave in Churchwarden Gothic was erected in 1824, an early instance of compliance with the requirements of the Incorporated Church Building Society for the contrivance of so many sittings *pro rata* of grant.

Trull parish Church has a square tower, and externally the architect will not find much of interest; but within the sacred edifice the nearly perfect and highly elaborated rood screen, with the florid pulpit and famous oak seating throughout the naves and aisles, will well repay a visit. The style of this work is very late, a mixture of Gothic and Jacobean ornament curiously devised and boldly cut. Some linen panelling at the west end is dated 1560. The pulpit has very boldly carved statues of four Doctors of the Church under ogee canopies, which blend into angel figures above. In the chancel there is some old glass *in situ*, that in the east window representing the Crucifix and SS. Mary and John.

Poundisford Park, once the seat of the Bourdillon family, is a rambling, low-proportioned, and many gabled Tudor-like house with plastered walls externally, and inside some refined and delicately-detailed ceilings contemporary with the building with others of later character. The mullioned windows are very similar in design throughout, and the Georgian addition, comprising a dining-room set at right angles to the entrance front, destroys the symmetry of the composition, which illustrates a somewhat uncommon arrangement. On the extremities of the façade are two big gables, and slightly recessed from these are two smaller ones, that on the left surmounting the porch towards the garden, and the other a bay. In between these is another gable, treated dormer-ways over the main wall, in which is the great window of the hall. The richly-treated lead water cistern, with the water spoutings and stack-pipe heads of elaborate design, is indicated in the small sketch printed with these notes. This is on the entrance side, and formed by the short projecting wings is a small sort of quad. The lead cistern, dated 1671, is enriched with frieze of figures indicative of the chase, wood-cutting, &c., and in the panels are centres of flowers in vases, mermaids, and the like. The hall, which is nearly square, has a sort of fan-vaulted or rather pendent-drop ceiling, with panels relieved by foliated centre-pieces. Over the Jacobean screen is an oriel window projecting into the hall, and between the screen doors is a lantern cupboard glazed on both sides, breaking forwards on both faces, and enriched with baluster uprights, making a little quaint feature. The Carolinian ceiling in the drawing-room is flat and heavy in treatment, with a dove bearing the olive branch as a middle piece of the composition. There is a picturesque brick-built Georgian garden house in the grounds, in harmony with the surroundings. Next week we shall give a general view of the house.

Ruishton Church has a handsome and sturdy

tower, denuded of its parapet or battlements, so that the eye is the more readily concentrated upon the exceptionally rich belfry stages. The lower of these has a central window over a deep string of quatrefoils, and it is filled with pierced stone tracery of corresponding design. On either side of the central window on each face are niches with pinnacled canopies and carved corbels; but the statues there have been removed. The upper stage has two windows of exactly the same design on each front, repeating the detail of the windows below. These are of the Perpendicular period, and are divided by angle-set wall piers, terminating above the springing of the hood moulds as spirelets. The buttresses to the four corners of the tower finish at the string level at the base of these windows, and grow from that point upwards into boldly designed disengaged diagonally placed piers which have gabled faces and crocketed pinnacles finishing below the cornice of the tower itself. The same idea less happily worked out is seen in the great belfry of St. Mary's, Taunton, and in the beautiful tower of Bishop Lydeard Church, which also resembles Ruishton in the arrangement of the belfry windows, which are likewise filled with pierced quatrefoils.

An exceedingly common feature in these parts, as at Kingdon St. Mary, and St. James's, Taunton, as well as at Staple Fitzpaine St. Peter, an extremely nice tower; but in all of these towers the belfry looks in perspective as if it set inwards from the main face of the tower behind the buttress pinnacles. Huish Episcopi is the same, but St. Cuthbert's Wells and at Wrington the buttresses run up into spires above the parapets. The west door and big window over it enhance the richness of the Ruishton tower, which is picturesquely located, as seen in the accompanying reproduction of a photograph by Messrs. J. Chaffin and Sons, of Taunton.

The last visit on Monday was made to the church of Creech St. Michael, which, although by no means a remarkable building in any way, is worth seeing, failing more notable material. The old stocks in the churchyard remind the faithful on their way to and from the sanctuary how evil-doers at one time were punished in this world. The church has a west front which gains interest from the three niches round about the big windows, one on either side, and one over, containing the mutilated statue of The Majesty. From the N.E. the group is interesting, on account of the tower being half-way down the N. aisle. It is earlier than the church, and originally was groined in the early 14th century. An old prayer-desk of Jacobean Gothic stands in the choir, and there are a few niches devoid of their statuary. The south porch is a glory-hole.

Tuesday's weather at the outset was extremely wet; but after leaving Dunster Castle, about twelve, it cleared, and the afternoon was truly tropical. The first halt was made at Minehead, which was reached by rail from Taunton. Minehead comprises, as most visitors know, three divisions, Upper or Church Town, Lower or Quay Town, and Middle Town, though this central distinction is hardly ever now used. The churchyard affords a view of exceptional beauty over the swelling uplands beyond the level plain; or, standing under the weather-beaten Scotch firs, we glance down the slope of the steep hill, neath which lies the roof-tops in the town. The rocky islets of the Holmes break the crested waters of the Channel, and yonder skirt the coasts of Wales and Somerset. Fashion has done much to spoil Minehead, and so-called improvements follow in the train of contemporary events and desirable building sites for the horrors peculiar to the speculating builder. Much, in spite of all, remains, and although the church has been restored, it has been done carefully, and serves its sacred purposes without the hindrances of dirt and neglect, once the peculiar characteristics of too many ancient churches. We publish a view drawn from one of Frith's capital photographs, and a plan of the church supplied by Mr. J. P. St. Aubyn, who repaired and re-seated the fabric a few years ago. The screen, too, is represented among our illustrations from a drawing lent us by the architect; but the modern panelling at top has been removed. Few churches in the West of England are placed, says Mr. Page, in a situation so commanding as that at Minehead on the hill-side, with the quaint old thatched cottages with their yellow walls to give it scale against the sky, giving an almost

Continental effect. The church itself is mostly of 14th-century date, the tower having been erected somewhat later by perhaps a hundred years. There are some sculptures of interest on this building, as the majestic group on the towers, representative of the Trinity and St. Michael weighing souls. The screen forming the chancel dates from 1499, but it is not so fine as that of Dunster. The school children used to be located in the rood loft. The Bacton table monument is one over which many a discussion has been held, and the skeleton within it was found, they say, to have had two rows of upper teeth in the skull, sharklike—for Bacton was a lawyer. The chest in the vestry is particularly beautiful, with delicate and rich tracery panels, almost German in feeling, and the font, as well as the Jacobean altar-table, deserves special mention. Dunster, which we described last week, was next seen, and Mr. Luttrell received the party at the castle with great kindness, showing the plans and points of interest in the mansion. The church was greatly admired, for it is a grand building, and the screen is truly a fine piece of lace-like woodwork, set off greatly by the masonry of the central tower.

Next followed the Cistercian Abbey of St. Mary in the Vale of Flowers. Clive, better known as Old Cleeve, lies within easy walking distance from Washford Station, on the way from Taunton to Minehead, and is fairly familiar to all who know anything about the religious houses of England. It was one of the Dunster Mohuns, a liberal benefactor in the early days of this abbey's history, who named the place the "Vallis Florida," calling to mind "Strata Florida," the Westminster Abbey of Wales. The rapid stream, which runs with a brawling gurgle at the west side of the abbey precincts, was known as the Rood Water from the Holy Cross Chapel at Watchet, once called Watchet Ford, where the stream flows into the sea. Damp and low-lying sites were thus mostly chosen by the stern Cistercians, so that "the monks being often"—as St. Bernard says—"in ill health, and having death before their eyes, should not lead a careless life." The grounds are approached by way of an old bridge spanning the Washford Brook, and the whole place, thanks to the conservative care of Mr. G. F. Luttrell, of Dunster Castle, is now scrupulously preserved from further destruction. The beautiful ruin no longer serves as sheds for cattle or storehouses for farm produce, so that the architect and lover of old buildings need not, as heretofore, clamber up over sheaves of straw before being able to examine the grand chestnut roof of the refectory or the exquisite tracery of its windows.

The first Abbot Ralph, with his twelve brethren, came from Revesby, among the fens in Lincolnshire, and the site for their new home was staked out with crosses of wood to mark the ground as intended for sacred purposes by Hugh the Abbot of Revesby, the very foundations of which have themselves been entirely eradicated. The founder of St. Mary's at Cleeve—William of Romare, Lord of Brlingbroke, grandson of the Earl of Lincoln—died in 1182, and the permanent buildings which he provided for were probably commenced some ten years later. "Cleeve," said the late Rev. Mackenzie Walcott, "was the grand-daughter of Rievaulx, to which Clairvaux, in France, sent the first colony." Every Cistercian minster had the statutable dedication of St. Mary. The church was excavated in 1875 at considerable expense, masons being employed under the zealous direction of Mr. C. H. Samson, F.R.I.B.A., to open up the doorways and windows still existing, and build in the openings which had been cut at various times in the conventual buildings. Carpenters renewed the floors, and the supervision of so eminent an authority as the late Mr. Walcott insured the discovery of anything likely to throw light upon a proper restoration of the long-lost plan of the entire foundation. A copy of this we print today with our two sketches of the refectory as it now stands.

The ruined minster measures 161ft. long, and, like Buildwas, which the A.A. excursionists saw last summer on the Shropshire excursion, was very severe in type, though somewhat later in style, being of the earliest form of 13th-century work generally known as the "Transitional." The floor of the church was covered with heraldic tiles, with the arms of many county names, some of which are still found at

St. Decuman's and Leighland. Similar tiles with floriated patterns are at Muchelney, which was seen on the Yeovil excursion. The piers in the nave were circular, and those in the transept were polygonal. The choir, as usual, was built first, with walls 6ft. 4in. thick. In the nave they do not exceed 4ft. in thickness. It measured 140ft. by 60ft., and was of five bays in length. Only the south walls towards the cloister now exist. The ritual choir, 40ft. by 20ft., accommodated the monks. Westward of this stood the rood screen, and the unusual arrangement of a longitudinal choir-screen also occurred here. The presbytery was square-ended and aisleless, measuring 17ft. deep by 29ft. in breadth. The usual eastern side chapels occur in both transepts. The conventual buildings, dismantled when

"Bluff Harry broke into the spence
And turned the cows adrift,"

soon became decayed, and at length a quarry. Cows calved in the sacristy, and pigs littered in the cloister; filth fouled the garth, while straw choked the calefactory. The central garden, with its pillared arcades and fountain, was, to the monk's eye, representative of the heavenly paradise, and the surrounding chambers, the Chapter house, the refectory, the cellarage, the dormitory, and the chapel, taught severally spiritual lessons to those who knew the mystic language of the age. The sacristy contains two aumbries, a recess for towels, and a laver where the celebrant washed his hands both before and after saying mass. The regular parlour was in the next chamber, and, like the last apartment, has a barrel vault, and is lighted by one lancet window. The Chapter House is an oblong, but is not divided on the common Cistercian plan into three aisles. This room measured 47ft. by 24ft., though the eastern bay under the munitment room has, unfortunately, been destroyed, two bays alone standing. They have quadripartite vaulting springing from the low shafts. The portal, as usual, to permit an unimpeded view of the interior from the cloister, consists of a large central arch flanked by unglazed windows. The sketch which we give shows the ruin as seen from the east, looking from the Chapter house into the cloister garth. A similar triple arcade exists at Buildwas and at Haughmond, visited during the Salopian excursion last August, and numerous other like examples could be mentioned. The daystairs leading to the dormitory come in front of the library or cloister ambury, then follows the slype, with cupboards for the monks to leave books and other things as they passed out to their work in the fields. The calefactory measures 60ft. by 22ft., and formed the "cella communis," with a fireplace which gave it its name. Doorways led from this to the convent garden on one side and into the Lower Gong on the other. The dormitory extends over the entire length of the eastern range of buildings, some 137ft. long by 24ft. 5in. wide, and is lighted by thirteen lancets on the west side and eight on the east. The dormitory for novices lost its floor at the extreme southern end, and in the S.W. angle is the door of the Upper Gong, or latrine, with a skew window. The arch is so ingeniously constructed, that the door, travelling on a spindle, always left half of the aperture open. The south side of the cloister was altered during the Perpendicular period. On the east side is the tresaunt, 30ft. long, leading to the garden. This shows as the first opening to the left of our upper sketch. At the end of it is the usher's door. The undercroft contains three chambers, originally intended for cellars. They are snug little rooms overlooking the garden, and excesses are thought sometimes to have been carried on here by weak brothers of the order, such as eating meat by stealth, and other minor wicked things. The large moulded arch in the wall marks the lavatory, which was thus in a recess. Shaving and hair-cutting took place here under the pent roof, now gone. The refectory on the first floor measures 51ft. 6in. by 22ft. 4in., and is Late Perpendicular in style, with a bell-cot high up in the wall, resembling one at Netley. The large traceried windows occur on both sides, the richer ones being on the south front, shown in the larger drawing on our double-page plate herewith. On this side is the fireplace, and flanking it is the reader's pulpit. The handsome, coved, hammer-beamed ceiling of chestnut springs from angel corbels, and over the dais are the remains of a painting of the rood, St. Mary and St. John, within a trefoiled arch. The buttery, called the painted chamber, and the abbot's solar are apart-

ments of interest, and the gatehouse, with its moulded arches, deserves mention. The holy rood is sculptured on the face of the abbey great gatehouse wall, but the building has suffered much from wanton mischief and impious folly. The upper part was recast in the 16th century.

The last place visited on Tuesday was St. Decuman's, where the beautiful ceilings over nave, chancel, and aisles are the great feature for study. They are perfect, and *en suite*. The barrel vault is divided in each case into panels by moulded and enriched oak ribs, and angel corbels occur along the exquisite frieze cornices. The slate-on-edge paving in the porch is a suggestion worth remembering. The commanding eminence occupied by the church makes it a very prominent object both from land and sea, set as it is on a hill overlooking Bridgwater Bay. St. Decuman, the legend says, was a Welshman, and his means of locomotion seems to have been peculiar, though exact details of his singular passage over the Bristol Channel from Wales are uncertain. Authorities differ—some saying the saint's method of transit was on a faggot or hurdle, and his lactiferous companion, the cow who afforded him sustenance, came of her own accord, and accompanied him in all his wanderings. He made his home on this hill where the church now stands, and here it was that the martyrdom of the hermit saint took place. He was decapitated; but rising above the difficulty of the situation, he picked up his head and bore it to the spring of the Holy Rood at Watchet to wash away the gore. Then jumping into the sea, he swam back to Wales with his head under his arm. History fails to state what became of the cow.

We publish herewith a plan of the church, which has been restored by Mr. J. Piers St. Aubyn. It is also remarkable for the loyal Wyndham tombs and ancient brasses on the east wall of the north chapel. The brazen bas-reliefs and heraldic bearings of these personal memorials are particularly well cut with interesting inscriptions. Sir John and Lady Florence Windham, who died in 1572 and 1596 respectively, hold converse thus with Fate on theirs:—

'MARITUS. When changeless Fate to death did change my life
I pray'd it to be gentle to my wife
Vxon. But shee who hart and hand to thee did wedd
Desired nothing more than this thie bedd
FATUM. I brought ye soules that linckt were each in either
To rest above ye Bodies here together."

John and Joan Wyndham have embossed and gilded portraits of about 40 years later, and note also the Caroline pew. Edmund Windham, whose figure lies in front of the altar rails, died in 1616. Hard by to this is the loyal Sir Hugh Wyndham, who served that selfish profligate, Charles II., and died unrewarded—

Here lies beneath this ragged stone
One more his Princes then his owne
And in his martred Father's warres
Lost Fortune Blood gained nought but scarres
And for his sufferings as reward
Had neither countenance or regard
And earth affording no release
Is gone to Heaven to ease his greese."

The table monument with the rich slab of blue marble is to the Earl of Egremont, in the north chapel of the choir. The font stands on a carved shaft upheld by angels. The chancel contains some Early English work; but the church is chiefly Perpendicular in style. It has a plain tower, and there are the remains of a screen more simple in design than others hereabouts, and some of the pillars have niches; but the iconoclasts removed the figures long ago; but one still has an ecclesiastical worthy in each of the four recesses, while to the rear of the Jacobean pulpit, with its sounding-board, are effigies of St. George and the Dragon, together with a Bishop. An hour's railway journey brought the excursionists back to Taunton, after an enjoyable and somewhat tiring day. The illuminations in the town concluded the proceedings so far; but we shall finish our notes of the rest of the week's doings next Friday.

STABILITY OF WALLS ON SOILS.—III.

Frictional Stability of Soils.

THE lateral frictional reinforcement of the support of piers afforded by the contact of the soil with the peripheries of their foundations is not so generally recognised as it ought to be, as frequently its power of reinforcing the sup-

port due to the actual pier-base is of so sensible an amount, that its effects are unmistakably evident, and cannot be ignored.

The support of bearing piles in soft soils is frequently due solely to this source of friction of the soil against their submerged periphery, and in this manner each pile frequently sustains a load of 20 tons and upwards. Mr. Bidder, C.E., considered 12 tons per pile of 12in. sides square section a safe load for piles driven in clay (*Proc. Inst.C.E.*, June 23, 1846).

It may be useful to note the following confirmatory practical data in connection with the subject of lateral frictional support. Mr. A. C. Hurtzig, C.E., in 1880* made tests of the power required to draw each of 420 12½in. square piles of rough-hewn Memel balk timber, which had

FIG. 10.

been driven five years in the Hull Docks, in about 13ft. of stiff blue clay, with 3ft. to 5ft. each of peat and silt and sand above it. The piles had an average superficial submergence of 76sq.ft. The net resistance to drawing was 1,875lb. per square foot in contact with the soil. Mr. Hurtzig made a comparison of the frictional resistance of these piles to driving, as taken from existing records of driving them, and found a very close correspondence between it and the amount of frictional resistance in drawing the

FIG. 11.

same piles, and also with their supporting power.

The following ultimate loads were applied to test piles, chiefly in connection with the construction of American works:—

- 600lb. per square foot of surface immersed in 9ft. sandy mud, 5ft. sand, 5ft. sandy clay, and 10ft. of fine clay = 29ft.
- 320lb. do. 15ft. in soft river-mud.
- 1,900lb. do. 16ft. in clean white sand.
- 1,850lb. do. 20ft. = 2ft. blue clay, 3ft. gravel, 5ft. stiff red clay, 2ft. quicksand, 3ft. red clay, 2ft. gravel and sand, and 3ft. stiff blue clay.
- 600lb. do. 32ft. in river-sand.
- 800lb. do. 16ft. in "alluvial mud."
- 1,400lb. do. 35ft. in sand and gravel.

The lateral frictional support of piles, and likewise of masonry piers, is, as may be observed from the foregoing, in proportion to the nature and extent of their immersed perimeter, as well as the frictional character of the soil with which they are in contact. Isolated piers of square or rectangular section present the largest perimeter per area-unit of its section to the action of lateral friction. The nearer their form is to the exact square section, the greater is the lateral support derived. The smaller the area of this or other form of section, the larger is the proportion of the perimeter. Thus, for a square area, the area equals the square of the side, whereas the peri-

meter equals the sum of the sides, or four times the square root of the area of a square. For rectangles, the area = product of two adjacent sides, the perimeter = the sum of the four sides. The smaller the measuring unit employed, the more apparent does the advancing excess of area over perimeter become. Thus, if inches instead of feet be used in measuring a 2ft. square section:—

Side.	Area.	Perimeter.
2ft.	4ft.	8ft.
24in.	576in.	96in.

An oblong made up of two equal squares placed side by side will have double the area of the single square pier-base, but will only have three-fourths of the single perimeters of both the single squares. Hence, in designing pier foundations, it is obvious that the loads should be distributed into a series of equal weights, so that the supporting piers may be of uniform size and geometrical shape, and also be constructed of like materials and prepared in similar class of workmanship. Thus only can a uniform co-efficient of lateral frictional support be assured in the same soil so as to insure uniform settlement of the building throughout its extent in all its parts. The following experimental data are added to form an idea of comparison between timber and masonry frictions in soils. These co-efficients of friction are the proportion of the pressure which produced them at the beginning of motion:—

	Dry.	Wet.
Granite, roughly worked, on gravel and sand	·43 ..	·41
Granite, roughly worked, on sand ..	·65 ..	·47
Granite, point dressed, on sand ..	·40 ..	—
Granite, point dressed on gravel ..	·60 ..	—
Ditto on dry clay	·51 ..	·33
American marble, sawed, on clay ..	·40 ..	·55
Pine, sawed, on gravel and sand ..	·41 ..	·41
Ditto on sand	·66 ..	·58

Note.—American marble with sawed surface may be taken as about equivalent to sawed limestone or sandstone.

A square pier, represented in elevation and plan by Figs. 10 and 11, may be assumed to produce lateral frictional area equivalent to the base of a truncated pyramid spreading round it in more or less extent of inclination of its sides according to the nature of the soils in contact with its periphery, the natural slope of the soil upon itself, and also upon the material of the pier surface. A circular pier likewise produces the equivalent of the base of a truncated cone. The extent of the base of such assumed equivalent pyramid or cone is, roughly speaking, represented at a line of intersection of the plane of rupture of the soil upon itself, say 1½ to 1, and the plane of the slope of repose of the soil upon the material of the pier, say, 1 to 1. The extent of such assumed reinforcing frictional base is here indicated by the space in the plan, Fig. 11, included between the dotted square around the square foundation and its outline.

In this assumed method of illustrating the equivalent of the lateral frictional action of the soil, when there has been a slight subsidence of the portion of the soil immediately underneath the pier base, a plane of rupture is brought to a bearing against the base of a pyramid of soil, and thus the lateral friction induces a reaction of the supporting soil which reinforces that immediately underneath the pier base.

It is not insisted that such an arrangement of masses of the soil is exactly reproduced in practice with such methodical disposition of planes, counterplanes, pyramids, and cones, as the conditions of the soil, active or passive, attending the initial settlement of the pier may create a multiplicity of annular planes and concentric sections of pyramids up around the sides of the pier, or of cones for round piers, as the case may be.

Ground Slips and Subsidences.—Another important condition which may vitally affect the stability of foundations is whether the surface of contact of underlying beds of the soils be level or inclined. If this surface of inter-contact be inclined, the upper bed will in time slide down upon the lower bed and carry the building with it. This is more liable to occur when permeable beds cover impermeable strata, and moisture has access to the impermeable surface. Such cases occur in connection with the London clay. The red or reddish-drab variety of clay is the weathered crust of the blue clay which it overlies; its reddish colour is due to the oxidation of the iron components. The surface which separates them from the blue may be more or less well defined, and when occurring in rising ground

may cause slips and subsidences, even where the geological deposit is quite level. Incidental drainage in the locality arising from wells, deep pits, cuttings or tunnels, drainage works, or dry weather may cause contraction of the mass and produce deep fissures, with the attendant facilities for access of moisture.

Landslips on Sidelong Ground.—Foundations on sidelong or hillside sites are frequently attended with landslips of a more or less serious character. The disposition of the stratification is sometimes favourable to such slips, especially when pervious and impervious soils are contiguous, and a disturbance of the surface soil as sod, &c., at upper levels permits of the percolation of surface water. On other occasions drainage of the upper levels of the ground by natural or incidental causes, and a succession of dry weather, may cause deep fissures that receive surface water, which may thereby have access to clay beds, shale, &c., which thus become softened.

Slips caused by "made" ground, infillings of stone and lime quarries, or ballast, gravel, sand, and clay pits and deep cuttings which have been done several years, may not be suspected. Any set of conditions which admit of the percolation of water at upper levels of the ground, and its subsequent access to masses of clay, loose earth, sand, &c., may cause dispersion of the one or softening of the other, or the damming up of water between imperious beds may cause the bursting out of springs or water-courses which permeate the intersurfaces of contiguous superimposed beds which are disposed to separate along their surfaces of contact.

Any alteration in the surface or other change which tends to localise the permeation or flow of ground or surface waters, or that aids in creating water seams, through fissures, veins, or the junction surfaces of superimposed beds, will cause subdivisions of the masses. Conditions of this nature are specially liable in chalks, which have a strong affinity for water, when affected by rain, frost, or thaw, or by the vibration caused by moving masses, as heavy machinery, railway trains, blasting operations, firing of heavy artillery, &c.

"Firm Earth."—The term "firm earth" frequently occurs in describing soils of foundations; but probably no two persons would give the proportional constituents of what they call "firm earth" precisely alike. What it really means to one person and in one locality will differ more or less widely from those of other persons and other localities, not only as regards actual present bearing power, but also as regards permanence of stability, as well as degree of tendency to processes of transitional forms, in which the bearing power may be greatly decreased. The term "earth" in this respect is of very vague significance, as it may mean any of the various materials as they occur in natural mixture in the composition of the crust of the earth, as distinguished from solid rock, unmixed sand, or gravel. Earth may therefore mean clay, loam (or sandy clay), marls (in which clay and lime are considerable ingredients), or any mixtures of these with vegetable matters, or their derivatives, in all variety of composition; or it may mean clean, dry gravel—clean, sharp sand. Such a term is too vague to be used in describing foundation soils, and it is surprising that it is so used in textbooks. It is much better to use terms which will indicate the main ingredients of the soil.

Law of Subsidence in Alluvial Soft Soils.—

1. When the pressure upon the soil increases in an arithmetical ratio, the subsidence increases in a geometrical ratio.
2. When the depth of the foundation from the surface of the soil increases in arithmetical progression, the subsidence decreases according to a geometrical series.

The above law is of great importance, and should be carefully considered. No. 1 shows how aggravated is the subsidence as compared with increase of pressure, and explains the reason of the serious displacement which occurs when a soil is unequally loaded by contiguous parts of the same building, or when the unit area pressure of adjacent buildings is unequal. No. 2 is equally important, as it explains how much more liable buildings are to settle when the foundations are put too near the surface, which is a frequent vice in jerry building; but likewise occurs, through want of appreciation of the law, principally in country districts, when small houses of one or two stories will develop cracks and fissures in the fenestrated walls.

"Made Ground" in Building Sites.—"Made" or artificially filled-up ground is to be met with in many building districts. Where it occurs, it frequently occasions more or less disaster to the building, even where provision has been made, which proved inadequate. Many disastrous cases have occurred where made ground had not been suspected, and hence sufficiently intelligent examination of the soil had not been made. Greater danger occurs when made ground only covers a part of the site, and hence when the bearing power of the made ground may be but a small fraction of that of the adjacent natural ground. Most of the "fills" consist of city or town refuse, mixed with animal and vegetable matter, asphalt and furnace ashes, &c., which has been dumped into old quarries or pits from which sand, gravel, ballast, or clay has been taken, old privy vaults, &c. It is seldom that made ground can safely be trusted with more than a quarter to one-third of a ton per foot square of footing base, and much of it would be unsafe with one-eighth to one-tenth of a ton per square foot.

Bearing Power of Foundation Strata.—The use of the term "rock" for foundation stratum is of vague significance, as it includes chalks, limestones, sandstones, granites, ragstones, &c., all of which kinds have widely different cohesive powers and densities, as well as different qualities in each kind, and there is likewise great difference in permanence of each kind and quality. The term "hard" prefixed to rock is likewise indefinite, and likely to be interpreted differently by different minds, the surface of rock foundation being more or less oxidised, and its cohesion thereby lessened.

The following safe bearing powers are taken at about one-tenth of crushing resistance in tons per square foot:—Chalk, $1\frac{1}{2}$ ton per square foot, when solid. Limestone—crystalline, 25 tons to 70 tons; dolomite, 28; oolites, 7 to 10 tons; soft limestone, $5\frac{1}{2}$ tons. Sandstones—strong, 25 tons; ordinary, 19 tons; weak, 10 tons. Granites, 76 to 140 tons; when in large tracts in thick, solid masses, 180 to 200 tons. Factor of safety in the following is 3 to 5:—Gravel and coarse sand, well compacted *in situ*, and protected from water and lateral "flow," 4 to 6 tons; sand well compacted, and not liable to lateral disturbance, 6 to 8 tons; sand not well compacted, 1 to $1\frac{1}{2}$ ton; clay, in thick, compact beds, and always dry, 4 tons; clay, moderately dry and compact, 2 tons; clay, moist, moderately soft, 1 to $1\frac{1}{2}$ ton; London blue clay, $1\frac{1}{2}$ to 2 tons; red ditto, hard, when not too near surface or containing gravel, 4 tons; blue clay, $\frac{1}{2}$ to $\frac{3}{4}$ fine sand and $\frac{1}{2}$ water, weighing 80lb. to 100lb. per cube foot, 2 tons; yellow clay, mixed with sand, $2\frac{1}{2}$ tons; ditto, near surface, and subject to moisture, $\frac{1}{2}$ ton; compact sand, with slight mixture of clay, $2\frac{1}{2}$ to 3 tons; compact clay, stony, 5 tons; alluvial soil or quicksand, according to moisture present, $\frac{1}{2}$ to $\frac{3}{4}$ ton. The stability of clay and alluvial soils is increased by admixture of sand and gravel. A 3ft. or 4ft. layer of hard clay resting on soft mud, which overlies a stratum of quicksand, $1\frac{1}{2}$ to 2 tons produced subsidence of 1in. per ton in one year. Loose gravel is compacted by grouting. Foundation soil of Hotel Métropole, Brighton, consists of 90 per cent. of geological debris of flint and gravel, of pieces of 3in. and smaller, and 10 per cent. of chalky clay, almost dry— $2\frac{1}{4}$ tons. In a recorded case a blue clay that contained one-third of its bulk of fine sand, and one-fourth to two-fifths of water in its composition, showed an ultimate bearing power of 6 tons per square foot. This was considered safe with a permanent load of one-third, or 2 tons per square foot. The permanent unit pressure on the foundation substratum of tall chimney-shafts, high towers, steeples, &c., should include due allowance for the vertical component of wind-pressure according to the range of its intensity. Light structures which have heavy running machinery that causes a maximum of vibratory disturbance, should have a minimum unit of static pressure on the foundations. Heavy structures with quiescent loads should have maximum unit of static pressure.

Unequal Settlements of Adjacent Parts of Building.

—These can only be avoided by the exercise of due skilfulness in all the processes of the design. (a) In systematically concentrating the loads and pressures at convenient points, and as far as possible in equality of amounts, to obtain a large duplication of parts; (b) in placing the supporting bases concentrically under the axis of these

points of load concentration; (c) in neutralising all abutting thrusts by a proper disposition and form of the masonry or other structural materials to insure vertical resultants of forces and economical execution; (d) the correct statical analysis of loads of all fenestrated walls; (e) correct estimation of all loads and pressures, and their due adaptation to the bearing capability of the soils dealt with.

Note.—The more compressible the soil the more exact should be the estimation of the loads. The "law of subsidence in alluvial soils" should be kept in view.

(To be continued.)

MORTAR.

IN a previous article, under the heading "Brickwork," was stated the surprising strength of waterbound brickwork, as illustrated by the difficulty experienced of separating its constituent parts by means of steel-pointed wedges driven by sledge-hammers, or, as they are more frequently named by those who use them, "flogging-hammers."

The cohesive and adhesive strength of mortar in waterbound brickwork is due not to its peculiar hardness, for that is a quality which it cannot be said to largely possess, but is due rather to its elasticity; for it is frequently found when cutting away or removing portions of this kind of work that a stout chisel may, without experiencing much resistive force, be driven into the mortar joints without any apparent effect beyond that of displacing so much of the mortar as previously occupied the space taken up by the chisel; the larger portion of the displaced mortar being driven into a closer molecular proximity than previously existed. The ancient Romans, who seem to have done all things well, are accredited with the practice, in the preparation of their mortars, of forming pits and burying the newly-made mortars for a considerable time before using them; a statement sometimes adduced (and not unreasonably so) to account for the strength and durability of their work. In criticising the remains of old work, it is well to remember that in that, as in all things, we have the survival of the fittest; that the bad work of the ancients (if they did any) is gone, like Prospero's "insubstantial pageant faded," leaving "not a rack behind," and we are left only with the good from which to draw our inference of the whole.

Such a process of mortar-making, however desirable, cannot in these go-a-head days, heavy city ground rents and suburban building of mushroom growth be now indulged in. But the really practical man is often astonished to find in specifications emanating from high places the following words:—"No more mortar to be made up at one time than is necessary for the day's consumption." This is a necessary provision when building in the winter season, and it is necessary to provide at other seasons that the mortar shall not lie about in thin isolated beds or layers until all moisture is extracted from it. But it is desirable under all other circumstances that it be allowed to lie sufficiently long to admit of the unequally burnt parts of lime taking in sufficient moisture to make them soluble, as lime that is not well burnt imbibes water very tardily.

Where this is not done these parts will slake in the brickwork, forcing out portions of joints in their immediate vicinity, and raising considerable portions of the overlying brickwork off its beds. Such under-burnt parts of lime are, when slaked, distinguishable by a dark bluish-grey colour, and if exposed sufficiently long to the air, will resolve themselves into a fine powder.

The limes in general use in and about London are the Dorking, the Merstham, and Hailing, and are known as grey or stone lime. These limes are used for the first and second coats of the plasterer—viz., the rendering and floating coats—as they acquire in setting a hardness which the chalk or pure limes never attain, the chalk lime being suitable only for the third or finishing coat, known technically as "setting," and which acquires its hardness by the process of trowelling to which it is subjected by the plasterer when mixed with about one-third of fine washed sand, or are otherwise gauged with plaster of Paris.

Well-burnt greystone limes imbibe water greedily, slake freely and quickly if supplied with sufficient water, while the eminently hydraulic limes imbibe water less freely, and slake very tardily, and for this reason blue lias

lime, when in the lump, should be covered over with sand for two or three days, and copiously supplied with water, before putting it in the mortar-pan, the wet sand retaining some of the water applied, and to some extent preventing the escape of the heat generated in the incipient stage of the slaking process, which two factors combined are generally considered to accelerate the slaking.

The advantage claimed for mortar that has been made up sufficiently long to allow it to properly cool is that the outer skin of the mortar-heap becomes sufficiently hard by the process of surface evaporation and the attraction of atmospheric carbon to imprison within the bulk sufficient moisture to slake the badly-burnt portions of lime, in the shape of "core," that may be in the mortar, to set up in its incipient stage the chemical action which we are told takes place between *silex* or sand-grains and dissolved lime, coating the individual grains or *nuclei*, and filling up the microscopic spaces which must exist between all angular grains, however small they may be.

By a proper process of retempering the mortar, the particles are driven closer together, the excess water is eliminated, and the mortar acquires a characteristic known to workmen practised in the use of mortar by the name of *toughness*, in which state it can be used with infinitely less liability to shrinkage than a newly-made mortar.

Walls built with retempered mortar and bricks sufficiently wetted—that is, wetted to a degree short of absolute saturation—a degree which can be better determined by the practical workman than prescribed here—produces the best results. By all means avoid the use of super-saturated bricks.

It not infrequently happens that a bad mortar is produced from good material, and the one chief thing productive of this is the modern mortar-pan, coupled with the impractical idea of many of our so-called builders of to-day (largely—very largely—recruited from the ranks of builders' clerks, with a knowledge of building commensurate to the making out a list of items under the head £ s. d., and circumscribed by the four edges of a sheet of foolscap) that any unskilled workman (i.e., unskilled in that particular branch) can turn out a bed of bricklayers' mortar. This work more often than not is assigned to the engine-driver, who does the double duty of engine-driver and mortar-pan attendant. If he be a competent driver, the chances are that he knows little, and cares less, about mortar; and years of practical experience in the supervision of work has taught the writer that the mortar is turned out of the pan either imperfectly incorporated, or, what is more frequently the case, is overground to such a degree as to be little better than mere dust when dry, the grit and body of the sand being ground out of it.

The objection to loam in sand is that it deteriorates the setting and indurating properties of the lime, coating the sand grains and forming a separating medium between them and the lime, to the injury of the tensile and cohesive strength of the resulting mortar. Mortars made of unclean or loamy sand are very liable to shrinkage and cracks. The use of water impregnated with loam or clay should be avoided, both in slaking the lime and in retempering the mortar.

F. WALKER.

PRIVATE ROAD AND STREET-MAKING.

THE necessity of controlling the formation of private roads and streets in the Metropolis is yearly increasing in importance. The estate building mania continues to an alarming degree; roads and streets are multiplied without hindrance, and the ratepayers are called upon to pay their proportion towards the formation and maintenance of new streets, which are not only uncalled for as public routes, but destructive of all privacy and residential quiet. We have called attention to the necessity of imposing some restraint on owners of estates and speculative builders in this respect, for we see quite plainly that the principle of the estate owner who lets his land to middlemen and builders, is to allow as many roads as can be cut through the land for the sake of improved ground-rents. Cover the land with houses is the idea of the speculator, who wishes to recoup himself for the outlay, not heeding the sensible advice that it is better to wait than to build upon the land all at once, as every estate

agent knows nothing depreciates a building estate more than to see a large number of new and unlet houses and carcasses. In every part of the Metropolis we find an unseemly haste to utilise every foot of frontage that can be got out of the land. Roads are run through an estate in parallel lines every 70ft. to 80ft. apart, which allow only houses and back yards, about 35ft. or 40ft. deep inclusive, to be placed back to back. This hurry on the part of the land-jobbers is intentional; the roads restrict the requirements of would-be purchasers and tenants; that is, they prevent them from obtaining a longer back area as a garden, and when once the houses are plotted out or commenced, alterations cannot be made, and tenants are obliged to be satisfied with what they can get. Proposed legislation has also hastened the formation of estates, and we believe many of the new roads and streets have been made before any regulation comes into operation to enforce a sufficient area of open space to be given to every dwelling-house. It is for the London County Council to be equally alert, and to pass as quickly as possible a law to compel every builder to give a curtilage of sufficient depth to every new house that is built in or near the Metropolis. This open space or curtilage should increase as the distance from the centre of London increased; instead of which, we find the open areas allowed in new suburbs three or even five miles from the City much smaller than they are in houses of a mile or two distant—an anomaly that legislation only can remove. The Building Act Committee of the London County Council have suggested, as our readers know, a rule by which the open space in the rear of buildings can be regulated with something like efficiency; but we think this rule, or angle of 45°, should be the minimum, and that the angle bounding the premises should be reduced in the suburbs. In fact, the Metropolis could be divided into zones for this purpose. But the question of open area resolves itself into the distance apart of new streets in the first instance, and if these were ruled by a schedule, the evil of overcrowding would be abated as a consequence. The architectural profession has a stake in this question. Many of the surveyors having control of building estates have an interest in maintaining the architectural character of the estate—that is to say, in having buildings erected of good design, which can only be possible when the roads are planned at such a distance from each other as will enable artistic elevations to be erected. The more numerous the streets, the closer are houses placed, and the more remote is the opportunity of the architect's employment. The Private Streets Works Act, which is to apply to any urban sanitary district, might be usefully extended to restrict the number of private streets.

OBITUARY.

MR. WALTER KIRKWOOD, senior partner in the firm of W. and J. Kirkwood, contractors, Edinburgh, died on Thursday in last week at the age of 61. Mr. Kirkwood was widely known in the building trade, having been concerned in the erection of several of the most important buildings in Edinburgh and neighbourhood—amongst others, St. Mary's Cathedral, the new University buildings, and the McEwan Hall, the National Portrait Gallery, the new Caltoun Gaol, Gosford House, and many other noblemen's mansions throughout the country. He was also engaged at the time of his death in arranging for the erection of the Scottish National Observatory on Blackford Hill, recently illustrated in these pages. Mr. Kirkwood always took a sympathetic and enlightened view on all matters relating to the wages and well-being of his firm's workmen, and, as the originator and president of the Boards of Conciliation between employer and employed, he was very largely instrumental in promoting harmony between capital and labour. He was also at the time of his death president of the Edinburgh and Leith Master Builders' Association. According to the *Scotsman*, "the point of Mr. Kirkwood's character which was most striking was his unflinching uprightness and honesty of purpose, which gained him the deep respect of everyone with whom he came in contact. This outstanding quality was combined in a rare degree with great business capacity." He had been in his usual health till Wednesday, when he was seized with a shock of paralysis, and death ensued the following day.

Mr. Kirkwood is survived by a widow, four sons, and three daughters.

Mr. Robert Wilkins, the founder and for many years the principal of the firm of R. Wilkins and Sons, builders and contractors, of Surrey-street, Bristol, died at Ilfracombe on Tuesday week, aged 82 years. The funeral took place on Saturday at St. Paul's Church, Portland-square, Bristol, and was largely attended. For the past few years, owing to age, Mr. Wilkins had been unable to take an active part in the business of the firm. He commenced business in 1851, and retired from the firm in 1882. During the last few years of his business career he was engaged in the erection of many large public buildings, churches, and chapels in the city and its suburbs, among the more prominent being the Congregational Church, Clifton Down; rebuilding St. Paul's Church, Clifton; enlargement of Merchants' Hall, Grammar School, Assize Courts, taking down St. Werburgh's Church and rebuilding the same, and Messrs. Dunlop's premises.

CHIPS.

At Salonica, in the ruins of the mosque of St. Sophia, destroyed in the fire of 1890, important discoveries have been made bearing on the Byzantine period. On the top of the minaret, which, before the fire, could be ascended only by Moslems, Professor P. N. Papageorgion has discovered and deciphered the sepulchral stone of an archbishop of Thessalonica hitherto unrecorded. It bears the name of Gregorius, and the date of his death is 1335. Some mural paintings of Greek saints bearing inscriptions have also been found.

In executing some works at the port of Carystus in Euboea, many blocks of stone, formerly united together by iron staples fixed by molten lead, have been found, together with fragments of sculpture and inscriptions. Near them were found marble columns, with fragments of sculpture. The inscriptions brought up by the dredge are, for the most part, dedicatory and sepulchral, and belong to the period of the Roman occupation.

The parish church of Rothwell, North Northamptonshire, is undergoing restoration at a cost of about £800, from plans prepared by the late Mr. J. D. Sedding. In the chancel the floor has been repaved with Devonshire marble, new stalls of oak provided, and also new hangings for the sanctuary. These works have been carried out by Messrs. Trask and Son, of Norton, Somerset. The bells are being re-hung by Messrs. Warner and Son, of London.

The ceremony of laying the memorial stone of a new bridge over the Clyde at Cambuslang was performed last week. The engineer of the bridge is Mr. Crouch, C.E., Glasgow, while the contract is let to Messrs. Paton and Thomson, Glasgow; the ironwork being done by Messrs. Alexander, Findlay, and Co., Motherwell. The structure will cost about £10,000.

A new Mission Room in Brick House-lane, West Bromwich, was opened by the Lord Bishop of Lichfield on Wednesday week. Messrs. H. Smith and Son, of West Bromwich, were the contractors. Messrs. H. Smith and Son's tender has also been accepted, and the contract signed, for a new vicarage for the Vicar of St. Paul's, Gold's Hill, West Bromwich, and the work will be proceeded with at once. The designs in both instances have been prepared by Mr. Jno. W. Allen, of West Bromwich.

On Tuesday last the Mayor and Corporation of Stafford visited the new baths to start the large clock which has been given to the town by the Right Hon. Earl of Shrewsbury and Talbot. The construction generally is from the designs of Lord Grimthorpe. Messrs. John Smith and Sons, Midland Clock Works, Derby, carried out the whole of the work.

The Llanelly School Board have instructed their architect, Mr. J. B. Morgan, M.S.A., to prepare plans of a school for the Dock district, to accommodate 300 children; also one for Machynis for 200, and to enlarge Powlyeats School.

Messrs. C. C. Dunkerley and Co., the old-established iron and steel merchants, of Manchester, have, we understand, decided to stock steel girders in large assortment, and their arrangements are so far advanced, that several consignments, embracing all the leading sections, are now in course of transit to their Manchester warehouses. This firm has maintained for many years past a large and varied stock of iron girders, channels, flitches, &c., and is favourably known throughout the building, engineering, and allied trades of the country. To this stock, steel girders will now form a very useful supplement, and we have no doubt whatever that Messrs. Dunkerley and Co. are acting wisely in thus keeping pace with the times.

ARCHITECTURAL EXCURSION SKETCHES.—MOSLEY HOTEL, PICCADILLY, MANCHESTER.—ALTAR-PIECE, BY CARLO CRIVELLI, AT THE NATIONAL GALLERY.

Our Illustrations.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

THE account of the proceedings, which we print on p. 239, contains descriptions of or references to these drawings of Old Cleeve Abbey, Minehead Church, and the Yarn Market at Dunster. The illustrations printed with the text show the Rood Screen, Minehead Church; Poundisford Park; Ruishton Church; a plan of Bishop Lydeard Church, and two further views of the monastic buildings at Old Cleeve.

MOSLEY HOTEL, PICCADILLY, MANCHESTER.

THIS hotel, which is now in course of re-erection, partly on its old site and partly on land adjoining, and belonging to the same proprietors, is one of the oldest commercial hotels, and occupies one of the most commanding sites in this city, being immediately opposite the very large open space in front of the Royal Infirmary. For many years the Lord of the Manor, Sir Oswald Moseley, held his court in the old buildings, which was followed by the usual dinner to the tenantry, and until recent times the rent audit has also been held here. The premises are intended as a high-class commercial and family hotel, and will be fitted especially with a view to these purposes. On the ground floor will be commodious smoke and stock rooms, under which will be the billiard-room, and on the first floor will be the coffee, commercial, drawing, and writing rooms, together with arbitration rooms and a large room for restaurant and auction sale purposes. On the five floors above this will be about eighty good bed and sitting rooms, and the kitchens and sculleries are placed on the top floor. The premises will be fitted with passenger elevator and luggage lift, and lighted with electric light. Great care will be taken to make the heating and ventilation successful, and the lavatories and bathrooms throughout will be fitted with all the latest and most efficient sanitary appliances. The new buildings are being erected from the designs and under the superintendence of Mr. J. H. Andrews, architect and surveyor, of 20, Cross-street, Manchester, and the contractors for the whole of the works are Messrs. W. A. Peters and Sons, of Rochdale.

ALTAR-PIECE BY CARLO CRIVELLI, ST. PETER AND ST. CATHERINE.

THE Madonna and Child which form the centre of this altar-piece were illustrated in our pages on May 6th last, and we publish Mr. W. S. Weatherley's drawings of the remaining two figures, SS. Peter and Catherine, to-day, thus completing the central panels of this great work by Carlo Crivelli, which comprises thirteen compartments in all. The altar-piece is dated 1476, and is in the National Gallery. We refer our readers to the BUILDING NEWS of the above date for further particulars concerning it.

THE SELECT COMMITTEE'S REPORT ON THEATRES AND MUSIC HALLS.

THE Select Committee of the House of Commons appointed to inquire into matters relating to the licensing and regulation of theatres and places of entertainment have just issued their report as a bulky blue-book of nearly 600 pages. The committee, of whose members, it may be mentioned, only one, Mr. Lewis H. Isaacs, was an architect, do not suggest any alteration in the management of theatres or music halls by public authorities in the provinces, or in Scotland or Ireland. With regard to the Metropolis, they recommend that a standing arbitrator be permanently attached to Her Majesty's Office of Works, to whom any dispute on structural matters be referred. They also strongly recommend that in the exercise by the London County Council of its functions as regards structural matters generally, the professional adviser of the Council should be given as far as practicable a position of independence, a free hand, and an undivided responsibility, in order to secure a uniform policy and procedure, and to avert causes of controversy. They do not concur with the desire of the London County Council to act as the licensing authority of London theatres, the evidence showing that the jurisdiction of the Lord Chamberlain, as at present existing, gives entire satisfaction. They suggest that the licensing authority for London music-halls should be a small standing joint committee of the County Council and of the Quarter Sessions. The framers of the report state that the vast improvement in the structure of London theatres during recent years has been mainly due to the zealous efforts, first, of the Metropolitan Board of Works, and afterwards of the County Council working through its Theatres Committee. The committee agree with the County Council that when owners or lessees have fairly fulfilled obligations imposed upon them by the Council, they should have safeguards against unnecessary interference during a certain term of years, during which no further requisition for structural alterations shall be made. The witnesses examined by the Committee, and whose evidence is given in full, included Mr. T. Blashill, superintending architect L.C.C., Mr. C. J. Phipps, and Mr. Walter Emden.

CHIPS.

An unpleasant duty fell upon Col. C. O. Ellison, the first president of the Society of Architects, on Wednesday, as one of the magistrates for Liverpool. Col. Ellison received a peremptory message on the previous afternoon from the Governor of Walton Gaol that his presence would be required at the execution of one Patrick Gibbons, who was to be hanged for the murder of his mother. Col. Ellison duly attended, when the governor explained it was absolutely necessary that a borough magistrate should sign certain documents in connection with the execution. At a meeting of the city justices, Col. Ellison indignantly protested against the custom, and the magistrates' clerk was instructed to look into the legal aspects of the question.

The chairman of the Colwyn Bay Local Board formally opened on Wednesday a new marine drive at that watering-place, which has been constructed at a cost of £8,000.

During the absence of the Queen and Court extensive renovations are being carried out at Windsor Castle. The interior of the grand reception-room in the Cornwall Tower, which is adorned with the "Golden Fleece" tapestries, is being regilded, and new heating apparatus is being arranged for the warming of the royal apartments on the south side of the palace. The roof of the library on the north terrace is being repaired.

Professor Reginald Stuart Poole will retire from his post as keeper of the department of Coins and Medals in the British Museum in the ensuing autumn, after a period of service of over forty years, twenty-two of which he has been the head of the department. During his tenure of office Mr. Poole has edited the official catalogues of Greek, Roman, and Oriental coins, of which thirty-one volumes have been published by the trustees of the British Museum. He is also an honorary secretary of the Egypt Exploration Fund. It is understood that Mr. Poole will continue to hold the professorship of archaeology at University College.

The Acton School Board discussed at great length at their last meeting a claim for £39 10s. made by Mr. E. Monson, their architect for the Beaumont Park schools, being commission at the rate of three per cent. upon work to the amount of £1,316 originally included in the contract, but omitted in execution. The account was eventually passed.

COMPETITIONS.

MANCHESTER.—The proposal of the committee of the Manchester Infirmary for the extension of the building—a proposal which, in one form or another, has been under discussion for some months—has now been definitely rejected. Some of the leading medical men wish to have a branch hospital at Stanley-grove, where it would be convenient for the professors and students at Owens College. The objections to this have been that it would entail too much administrative expense, and that there is plenty of land surrounding the present building, upon which wings could be erected. The trustees have been called upon to vote in the matter, and they have decided, by 414 to 284, against any extension on the present site, although, as we announced three weeks since, a sub-committee recommended the adoption of the scheme prepared in competition by Mr. Alexander Graham, F.S.A., of Regent-street, S.W., which showed two new wings, an operating theatre, and the enlargement of the nurses' house, and were estimated to cost £40,720.

SOUTHPORT.—In a limited competition among thirteen firms of architects for a new infirmary to commemorate the centenary of the town, the committee, acting on the advice of a professional assessor, have adopted the plans sent in by Mr. C. Sydney Ingham, of Manchester and Southport. The work is to commence at once, and it is to be hoped that the foundation stone may be laid towards the end of October. The style is Free Flemish, the materials are stock bricks and stone dressings, and the cost will be £13,000, exclusive of site.

ARCHITECTURAL & ARCHAEOLOGICAL SOCIETIES.

YORK MASTER BUILDERS' ASSOCIATION.—The annual excursion of this association took place on Wednesday week, when Grantham and Belvoir Castle were visited. To the number of 35 the party left York by rail in special saloon, arriving at Grantham shortly after nine. Breakfast was partaken of at an hotel, and subsequently the members proceeded in conveyances to Belvoir Castle. Here they were shown through the interior of the castle, the plate, jewelry, &c., while the grounds, the stables, and the kennels were also viewed. Journeying back to Grantham, dinner was served at the hotel, after which the places of interest in the town were visited.

The 44th annual meeting of the Somersetshire Archaeological Society was opened at Wellington on Tuesday. An address, chiefly dealing with pre-historic remains, was given by the new president, Mr. W. A. Sanford, and visits were afterwards paid to the parish churches of Wellington, Bradford, and West Buckland, and to Werbestone House.

A discussion in the town council of Hull as to the necessity of framing a more stringent code of building regulations has been followed up by some correspondence on the subject in the local newspapers. Well-defined frontage lines and some powers over the height of buildings are the chief requirements, together with a proviso that approval of a plan shall be invalid if the proposed building is not carried out within some definite period—say, two years.

The foundation stone of a bridge across the river Skell, between Ripon and Bondgate, was laid on Friday. The bridge replaces a narrow stone one of high gradients, and will be of iron girders with stone piers. The bridge is to be built to the plan of Mr. Henry Dearden, late city surveyor, who has since been appointed borough surveyor of Batley, the work now being superintended by the present city engineer, Mr. T. Kidd. The contractors are, Messrs. DeBergue and Co., for iron work, £920; Mr. W. F. M. Blackburn, for stone work, £595; new walks, kerbing, channelling, and asphalt road-way to be carried out by the corporation, £171, total, £1,686.

A new Wesleyan chapel at Whitewell Bottom, Rawtenstall, was opened on Tuesday week. The cost of the new building and internal alterations in the old building, which is to be used as a school, is £1,600. The nave is 50ft. by 30ft. There is a small chancel to accommodate the choir, the minister's vestry and organ-chamber being arranged to the right and left respectively. The style is Early Gothic. At the prominent angle there is an octagonal spirelet to the height of 56ft., terminating in an open flèche in Stettin oak. The chapel is erected in stone, and the internal woodwork is of pitchpine. The architects were Messrs. William Waddington and Son, Manchester and Burnley, and the contractors were Messrs. Moore Brothers, of Rawtenstall.

WAYSIDE NOTES.

OUR English watering-places should do well this year. The cholera scare will keep thousands of persons at home who would be off to foreign parts. Scotland, they say, too, is wonderfully patronised this season, and North Wales doubtless follows suit. It may be that the *canards* respecting the sanitary condition of our seaside resorts come from abroad; anyhow, it is astonishing how numerous they have been this year. Here there has been fever, there small-pox, and the drainage of this and that watering-place is defective. More or less of this sort of thing is to be noticed every season; but I seem to have observed more complaints than usual. It may be that certain individuals have a habit of looking with hypercritical eye upon the sanitary arrangements of each new town with which they make acquaintance. I refrain from suggesting that inspectors of nuisances, when holiday-making, are wont to spend their leisure hours in discovering defects of drainage, &c., or a higher rate of mortality from certain infectious complaints than they deem compatible with a healthy town.

Yet there may be something in this; for we may observe that every seaside place has its turn, just as though some individual or individuals resorted to a new field for enterprise year by year, and duly addressed a communication to his or their particular "morning." Brighton long ago had its day, and was reported in such a state as would lead one to expect direful results to man and beast, yet the town remains with its enviably low death-rate. Worthing is now having a turn, and correspondent "Sanitas" has discovered some dreadful things. Among them may be a mare's nest. Margate was once very favourite game with these discoverers of insanitation. Someone manufactured an epidemic of smallpox at Yarmouth this year, and I was glad to see that the mayor of the town denied the existence of any cases of the disease. Smallpox is rather a cheap line with mongers of this kind of news: a little rumour makes a great scare. During the strawberry season it was reported that smallpox was raging among the gipsy fruit-pickers in the Cray valley, and that tons of strawberries had been condemned. The latter may be true; but most probably the "epidemic" consisted of one or two cases promptly hurried off to the floating hospital at Purfleet. Yet I know that many near residents shunned the Cray district for months, as though it were a plague-spot.

The *Times* has recently concluded a series of articles dealing with the question of the water-supply of London. The writer makes out no more cheerful a case than others have done. So great has been the increase in consumption during the past few years that we are stated to be within reasonable distance of a water famine. Add to this the fact that about one-half of the present supply is drawn from the Thames and the Lea, and the outlook is not encouraging. The only hopeful feature about the water supply question is the great and continual increase in consumption. "More water, more health," would be a very true aphorism. The water, however, should be pure, and not highly-diluted sewage, as we are frequently informed by statistical statements to be the case with regard to much London water. The conclusion of the writer with regard to the question of new sources of supply is that London must go far afield. New supplies are only to be gained near at hand by seriously injuring the population of the districts whence the water is procured. To drain away all the water of a certain area of country in order to supply a distant city is manifestly unfair. More water, it is said, may be procured from the chalk hills. In Kent there is, however, at the present time, a considerable drain upon the supplies. As an example of the difference the institution of a pumping-station may make, there is at the south end of the village of Orpington a deep hollow, which in former days was periodically full of spring-water. Since, however, the erection of the pumping-engines, that may be noticed below the steep embankment of the South-Eastern Railway, the hollow has been as dry as a bone, although fully half a mile from the pumps.

Grand old Carshalton Park is to be parcelled out at last. On Monday a first portion of the

estate was sold by auction, 10 acres realising £3,869. The entertaining auctioneer, I am told, made many humorous references to the effect that the deer in the park constituted an attraction worth an additional £5 a year of anyone's money, while other benefits and advantages were worth a like sum; but the real gain would be residence near so charming a village, if indeed Carshalton with its Park turned into a building estate, and its old church restored out of all knowledge, will be anything like Carshalton of old.

We have so little Saxon work left that it is always of great interest to hear of any reputed discovery of pre-Norman architecture. At St. Augustine's Church, East Langdon, Dover, which was reopened on Friday last after complete restoration, it is said that two Saxon windows have been discovered, and a date of 700 B.C.—the supposed date of the older part of the church—has been assigned to the work. The windows had been blocked up, and were discovered in the course of taking down the old gallery. If these features are of genuine Saxon workmanship, the building should become noteworthy. Of what Saxon architecture remains in this country, Kent possesses—or has hitherto been supposed to possess—little or none. Bloxham mentions the substructure of the south wall of Lyminge Church as containing vestiges of Anglo-Saxon architecture, and as having been personally visited and examined. Among other buildings reputed to contain vestiges of this style of architecture this authority puts Swanscombe Church. I know the latter, but the traces of the Saxon method of building are very meagre. If St. Augustine's, East Langdon, does not possess anything more plainly Saxon than this, there will be little to go out of the way to see. If, on the other hand, there be something like Sompington, Sussex, the discovery is remarkable. On, or near, the coast of Kent, one would be surprised to find even a trace of Saxon architecture, it being presumed that the rebuilding in Norman times would be very general and thorough.

The best club—so far as instruction is concerned—for juniors is where there are plenty of seniors. Shall the blind lead the blind? I have some sympathy, though, with your correspondent's aspirations. The Architectural Association is growing more and more academical and less social; young men may feel the want of a new mutual aid society. But under eighteen! Why, there would have to be a matron and nurses!

Your Glasgow architect seems to have solved the problem—"Architecture—a profession or an art?"—by designating architecture a "business." His championing the cause of Scotch pupils is a praiseworthy act, seeing that the pupil as an individual is little championed, whilst we all write vaguely of "students" in the *bu'k*. Architects' pupils in Scotland have certainly not the advantages of London students; but then neither have the provincial pupils in England these advantages. Still, the architectural student in Scotland is thrown more on his own resources. Other things being equal, this should produce a self-reliant youth—one who digs out for himself—quite the young man for me. The desirability of careful training, however, has been fully demonstrated by this time, and the Scotch pupils, if they themselves feel the drawbacks referred to by your correspondent at Glasgow—should endeavour to have the want of educational facilities supplied. Glasgow being the second city of the British Isles, and a city of which the British nation may well be proud, ought not to lack educational facilities of any kind. This is surely a matter for Scotch architects who are something more than business hunters and practitioners.

GOTH.

Preparations are being made for the erection at Eccles of new day and Sunday schools for St. Andrew's Church. The cost will be about £6,000. Mr. H. Lord, of Manchester, is the architect, and Messrs. William Brown and Sons the builders.

A stained-glass window, representing the commissions given to St. Peter, has been placed in one of the side lights of the chancel of Tysoe Church, Warwickshire. It has been executed by Messrs. Lavers, Barrand, and Westlake, of London, the artists of all the other stained-glass windows in the same church.

COLLAPSE OF FLOORING AT A BAKERY.

AN accident of an alarming nature is reported in the Scotch papers as having occurred on Saturday in M'Neill-street, Glasgow. A bakery was being built as an addition to the United Co-operative Baking Society's premises, which partially collapsed, fortunately without incurring loss of life, though involving serious destruction to property and injury to a workman. To insure fireproof construction, the floors were formed of arches of white enamelled bricks, and sprung from iron beams fixed to the walls, tied together by iron tie-rods, which are continued through the length of each floor. One of these in the third story snapped, when the gable yielding to the pressure of the arches bulged out, causing the arches to fall crashing through the floors beneath. Men were engaged laying cement on the floor, and hearing the loud report caused by the snapping of the tie-rod rushed to the staircase just in time to avoid being precipitated. A man named Brown jumped from a window and broke his left-leg. The bakery is an ornate brick structure of four stories and attics, with a frontage to M'Neill-street, a portion of this building has been in use some years, and the addition was made at the north end as a continuation about 60ft. long. The contractors are Messrs. Bell, Hornsby, and Co.

CHIPS.

Works in connection with the erection of the Central Electric Lighting Station at Temple Back, Bristol, which were stopped for a month owing to the recent builders' strike in that city, have been recommenced this week. Mr. H. J. Williams, of Bristol, is the architect. A Local Government Board inquiry was held at the Council House, Bristol, on Friday, before Mr. Rienzi Walton, inspector, into an application from the city council for sanction to borrow £66,000 to carry out the lighting scheme.

A small Wesleyan chapel is being built at Gaws-worth, near Macclesfield, by Mr. John Clayton. Services have been held in the surrounding farm-houses for upwards of 100 years.

The town council of Stafford last week voted a gratuity of £50 to Mr. Blackshaw, the borough surveyor, for his services in connection with the public baths.

A large block of buildings is in course of erection for a corner site at St. Anne's-on-Sea from plans by Mr. Herbert Wade, of that town, at a cost of over £5,000. The premises will consist of shops on the ground floor, and on the floors above, suites of offices and a public hall, seated for 200 people, and having two exits. At the angle of the two thoroughfares will be a clock tower. The frontages of the building will be of Accrington brick with stone dressings, and the block throughout will be lighted by electricity.

The London and South-Western Railway Company, which on November 1 next takes possession of the Southampton Docks, recently purchased by it for the sum of £1,350,000, last week applied to the Southampton Corporation for a grant of 20 acres of mudlands south of the new Empress Dock, for a proposed new dock and quay-wall, which will be 1,800ft. long. This will involve a further outlay of £250,000. It is understood that the Inman Steamship Company are prepared to take advantage of this new accommodation as soon as it can be provided. The corporation have granted the land applied for on the condition that a steamship company make it their headquarters for a period of not less than ten years.

The foundation stone of a R.C. church was laid at Bideford last week. The church will be cruciform on plan, and built of local stone with a slated roof. It will be 58ft. in length by 22ft. across the nave. Mr. Lethbridge, of Plymouth, is the architect.

On Tuesday week the new infant school in Talbot-street, Rugeley, was formally opened by the Bishop of Lichfield. The new building, which is built of brick with stone dressings, consists of a large room 50ft. by 20ft., a classroom 20ft. by 20ft., and a cloak-room. The school will accommodate 175 infants, and has cost over £1,100, the architect being Mr. John Greensill, of Great Wyrley, and the builder Mr. Thomas Mason, of Rugeley and Hednesford.

The Bristol town council have approved of plans prepared by the city surveyor for an infectious diseases hospital to be built on a site of 13 acres at the Novers, Bedminster. The buildings will eventually consist of 14 wards containing 220 beds, and are expected to cost in all £32,500; but at present only half the scheme, consisting of seven ward blocks, and two administrative blocks are to be carried out.

PRICES.*—XLIII.

5in. mortise night latch, 2 keys and brass bolts	ditto 0 13 6

OSBORNE HOUSE.

THE important new addition to Her Majesty the Queen's marine residence at Osborne, Isle of Wight, is now virtually completed, but there is still a month's work for the decorators in the Durbar room. The design of Mr. J. R. Mann, A.M.I.C.E., surveyor of works to the Osborne Estate, was approved over two years ago, April 1890, and the work was immediately commenced by Messrs. W. Cubitt and Co., Gray's Inn-road, London, who have carried out all the work with the exception of the ornamentation of the Indian room, to be known in future as the Durbar room, which is being done by Messrs. Geo. Jackson and Sons, Rathbone-place, London. The carcass was completed in eight months, and the entire block, with the above exception, in sixteen months. During the several occasions the Court was in residence the work was stopped, thus delaying the work a good deal.

The extreme dimensions are 120ft. long, 43ft. wide, and 45ft. high. The central 70ft. projects nearly 2ft. before, and is also higher than the ends. It runs parallel to the building joining the main and household wings, which has a colonnade on the first floor. A long connecting corridor was necessary in order to obtain a symmetrical elevation. Junction is made with the nearly square pavilion building (that occupied by the Queen and other members of the Royal family) at the corner to the left of the entrance portico, near the foot of the flag tower. The new design is, of course, in harmony with the older buildings in the Italian Renaissance style, rustications and pilasters being the main features. The new building is only two-storied, the older blocks being, without exception, of three.

The building returns to the pavilion only wide enough for a 10ft. corridor; at the terrace or lower end a large serving-room is fitted up with the necessary appurtenances, hot closets, &c. Two doors lead from this one across the landing of the principal stairs into the Durbar Room; the other on to the serving-stairs from the basement landing, and by a second door into the Durbar Room. The Durbar Room, with its large bay window, is on the lawn side of the building, the main corridor being on the quadrangle side. Ahead of the main corridor, and at right angles to it, a passage returns leading into the hall of the front entrance. On the right of the entrance a flight of stairs lead to the floor above; on the left there is a small waiting-room.

The space on the one-pair floor above the Durbar Room (60 by 30ft.) is divided by half-brick partitions into three commodious rooms. The three casements of the centre room communicate with the paved roof of the bay window. At each end of the building there are two bedrooms.

The main staircase is lit by a lantern light; the return passages are also partially lit by borrowed lights in the framed roof. Owing to the different levels of the ceilings of the ground floor, there are three floor-lines to the first floor, necessitating two flights of steps in the main corridor.

Windows with three-quarter Corinthian columns on the ground floor, with a level block cornice, are a novelty in the design, there being so such in the older building. The enriched Ionic caps to the ground-floor pilasters seem to have been suggested by Michael Angelo's design at the Roman College. The caps to the Ionic pilasters above are not enriched. The centre portion has a massive upper block cornice enriched with egg-and-tongue, the plain frieze being cushioned. The cornice below is broken over the pilasters, with cushioned frieze only at the break; it is, together with the upper cornice of the ends, enriched with dentils. The entire building is surmounted by a massive balustrade. Above the dados of the lower portions vases are fixed. The front entrance has a rusticated impost, a voussoir to the circular head returning plain under the soffit; engaged Doric columns are on either side. Above the door leading from the return corridor on to the terrace is an imitation oyster-shell, projecting 2ft. forward, supported by a bracket at

each edge. The letters "V.R." stand out in high relief from a richly-ornamented frieze between the door-head and shell. An architrave runs round the opening.

The work has been done in a very substantial manner. The building is fireproof, with the exception of the roof directly above the Durbar Room, which is queen-framed and slated. The principals are 30ft. span, averaging 8ft. centres; the flat top is only 2ft. above the balustrade. At one spot the exterior wall came directly on the edge of a large well 10ft. diameter and 35ft. deep, being one of a number forming a reserve water supply, the ordinary supply being obtained from one 100,000-gallon covered reservoir one mile away, the water being pumped thence by steam power into the cisterns throughout the house. In order to carry the wall across the well, a monolithic mass of concrete was formed half-way round the 9in. dome; above the footings to the 18in. wall, three double-headed ordinary steel railway bars 21ft. long were firmly bedded and tied in, the brickwork being executed round it in Portland cement. The floors are formed of half-brick arches springing from corbels or rolled joists, the spandrels after being filled in with dry brick rubble. The girders carrying the ceiling of the Durbar Room are built up of wrought iron 21in. and 22in. deep: those carrying the half-brick partitions have an extra thickness to the compression flange. The spandrels of roof arches are filled up with concrete to 6in. above the crowns of the arches, and laid to fall 2in. in 10ft.; two courses of sole tiles (11in. by 6in. by 1in.) were then laid in cement, the surface being finished by an inch rendering of Portland cement. All walls are built solid; all external walls are battened internally, horizontals of oak 3in. by 1 1/2in., 2ft. 6in. centres; verticals 2 1/2in. by 1 1/2in., of deal, 15in. centres. Hot water is laid on to the bath and the sinks, the supply being drawn from a copper cylinder in the roof, in circulation with an inner copper vessel of a small boiler in the basement. On the ground floor there are 2,500ft. of 4in. hot-water pipe. The coils of pipe are laid in brick channels where there is no basement, and incased in the ceiling where there is. Brass hit-or-miss ventilators are placed at convenient points in the corridors both on the ground and first floor for the admission of the warm air, brick shafts carrying the air from the chambers. In order to tie the walls together, and thus materially strengthen the carcass, 3in. by 3in. endless W.I. bond was bedded 2in. from the inner face of the wall at all girder-levels, thus also counteracting the thrust of floor arches. If in any case the thrust of an arch came directly on the wall, the substance of the bond was increased to 3in. by 3in.

The Durbar Room so-called, by its nature an Indian room, is 60ft. long by 30ft. wide, and 19ft. high, with a large bay window 17ft. by 8ft. on the lawn side. It was to supply a room of these dimensions that the wing was built, there being no room, except the drawing-room, in the house approaching this size. For the almost annual visits of the Emperor of Germany, and on such occasions as the visit of the French Fleet, a large dining-room is essential. Bhai Ram Singh, from the School of Art, Lahore, is the artist; the work is a creditable monument to his skill as an artist, and also as a modeller. The design is so intricate and unsymmetrical that it is next to impossible to give a comprehensive description of it. The ceiling is composed of large panels and beams, with ornament, generally in very high relief, covering the entire surface; circular pendants project down from the junction of the beams. Members of the animal and vegetable kingdoms enter largely into the ornament. The profuseness of the enrichment, and being of such a varied and prominent character, produces a wonderfully fantastic effect. The panels were cast in one in fibrous plaster; the beams mitring covered the joints. Double brackets of magnificent design intercept and break the coved cornice at suitable points. A dado 5ft. high (including starting and sub-base) runs round the room, framed in mahogany, with panels in papier-mâché and carton pierre. A gallery intended for musicians projects 6ft. from the wall at the lower end, partly supported on two piers; from floor to floor is about 9ft. The centre 16ft. between the piers has three large openings, the centre one, being widest, leading on to a balcony carved in mahogany, with panels between the stiles of a very intricate and effective geometrical pattern. These panels were executed in India.

The chimneypiece on the opposite side central of the bay window is framed in mahogany with carton-pierre enrichment. Three columns placed triangularly on plan form the jambs. The opening is 5ft. square; thick chamfered pieces of veined marble protect the woodwork from the stove. Above the chimneypiece stands an enormous peacock with extended tail, covering a surface 5ft. square. The large opening to the bay is arched, the domed ceiling to the bay abuts against the arch. The principal entrance is from the main corridor by folding doors (10ft. by 6ft.) Above the door in a recess sits composedly a miniature representation of the Hindoo god Schwiji. Besides the above door there are two at each end. The whole will be painted and finished in white and gold. When completed, this room will look one of the grandest in the country.

CHIPS.

The first section of a steam laundry has just been built in Onslow-street, Guildford, at a cost of £2,000. As at present fitted the laundry will employ between 45 and 50 hands. Messrs. E. and A. Miles have been the builders, and Mr. A. J. Sturges the architect, the work being carried out under the superintendence of Mr. Adams. Messrs. Manlove, Alliott, and Co. supplied the machinery, and the electric light plant has been supplied by Messrs. Appleton, Burbey, and Williamson.

An important work of restoration is being carried on at Ely Cathedral. The roof was found in some parts to be in a bad state, the wood being much decayed. The work of restoration was commenced a month or two ago, but it has proved a more formidable undertaking than was at first anticipated. About 30 tons of new lead have already been used in the re-covering of the roof.

The will of Mr. Henry Brown, late of Highfield, Luton, Beds, timber merchant, who died on May 1st has been proved, the value of the personal estate exceeding £28,000.

The concluding meetings of the annual congress of the Cambrian Archaeological Association were held on Friday at Llanddillo. Excursions were afterwards made to the old British fortress and earthworks of Carnagoch and Castellmeurig, the ancient churches of Llangadock, Llanfairabryn, and Llandingat, Llandovery Castle, and the Roman Station.

The city council of York have resolved to form a promenade on the Clementhorpe bank of the Ouse at an estimated cost of £4,800.

The annual loan collection of pictures at the People's Palace, Mile End-road, London, was opened to the public on Saturday, and will remain on view until the 10th September. This year the show at the People's Palace is quite up to the high level reached in former years, and covers more space than on any previous occasion. The works on loan include examples by Sir J. Gilbert, E. Long, J. E. Hodgson, F. Goodall, Phil Morris, J. W. Waterhouse, Dandy Sadler, H. T. Wells, and Briton Riviere.

The church porch at Ruyton-XI-Towns, Salop, has just been carried out by Mr. Warwick Edwards, from plans by Mr. A. E. Lloyd-Oswell, of Shrewsbury.

At the Pontypridd police-court, on Wednesday, the Pontypridd local board summoned S. F. Lewis, of Llandaf, who is erecting a large number of houses at Pontypridd, for proceeding with the erection of certain dwelling-houses before the plans were passed. The clerk to the board conducted the prosecution, and the defendant, who pleaded that he had committed the offence in ignorance, was fined 10s.

In connection with the restoration of the ancient Grammar School and Guildhall at Stratford-on-Avon, now in progress, some interesting discoveries have been made. Human bones, portions of coffins, and fragments of wrought ironwork have been found wherever it has been necessary to excavate for new foundations. There have also been found pieces of carved and moulded stone, exactly corresponding with the chapel of the Guild of the Holy Cross, which was rebuilt in the time of Henry VII.

The formal opening of the Market House, erected by the Bilston Township Commissioners, upon the old market ground, off Church-street, Bilston, took place on the 9th inst. The plans were prepared by Mr. S. Horton, of Wednesbury, the contract was undertaken by Messrs. Dorset and Son, of Cradley Heath, and the total cost has been £8,000. The premises consist of a single rectangular hall, without structural divisions, but divided up into 140 stalls and shops. Out-offices are provided in Vine-street. The hall is lighted by roof lights. The building is constructed almost entirely of red brick, but in the principal frontage the material is terracotta.

Building Intelligence.

BIRMINGHAM.—Four very important new buildings, or additions to existing buildings, for educational purposes, are, says the *Birmingham Post*, now in hand in that city—namely, large and important additions to Mason College and the Municipal School of Art, a Girls' Grammar School at Camp Hill, and a Seventh Standard School for purposes of technical instruction at Small Heath. The additions to Mason's College are being made at the rear, and consist of medical schools to cost £20,000; Messrs. Cossins and Peacock are the architects, and Messrs. W. and J. Webb, also of Birmingham, are the builders. The Central Municipal School of Art is being enlarged by the addition of a wing of nearly equal size. The extension is being carried out by Messrs. Martin and Chamberlain, and the builder is Mr. John Bowen. The cost of the building, apart from the site, will be about £11,500. This extension will complete a block of important public buildings, consisting of the School of Art, the Parish Offices, the School Board Offices, and the Medical Institute, entirely covering the large area bounded by Edmund-street, Margaret-street, Cornwall-street, and Newhall-street. The girls' department, now being added to the Camp Hill Grammar School, is being built from plans by Messrs. Martin and Chamberlain, Messrs. Moffatt and Son being the builders, and at the same time the accommodation in the boys' school is being increased from 250 to 350 places. The building is Modern Gothic in character, and faced with red brick, terracotta being used for dressings; 312 girls will be accommodated, and the total outlay will be £15,000. The new board school at Small Heath will cost about the same amount, and is a one-story building for 300 boys and 300 girls. Messrs. Martin and Chamberlain are the architects, and Mr. T. Rowbotham, of Coventry-road, Birmingham, is the contractor.

BOWLING, BRADFORD.—The buildings at Bowling Cemetery have been completed by the erection of the Roman Catholic chapel. The chapel occupies a position at the eastern extremity of the central terrace, the Nonconformist chapel being at the western end. The chapel provides sitting accommodation for about one hundred persons. Messrs. Morley and Woodhouse are the architects, and the contractors for the several works have been—W. Farnish, mason; F. Clough, plumber; John Bolton, plasterer; Thornton Brothers, slaters; A. Arundel, painter, all of Bradford; and J. Deacon, joiner, of Shipley.

BROWNEDGE.—The Roman Catholic Church of St. Mary, Brownedge, near Preston, built in 1828, has been practically reconstructed from plans by Messrs. Pugin and Pugin, of Westminster, and was reopened on Sunday week. The edifice is now cruciform in shape. On each side of the nave large transepts have been erected, and on either side of the chancel are chapels. A gallery has been erected at the west end, principally for the accommodation of the choir. A new altar is being erected; it is composed principally of Uttoxeter alabaster and marble shafts; the canopy, when completed, will be 30ft. from the floor. Round the sanctuary, and forming corbels to the shafts between the windows, are angels bearing musical instruments, carved in Stourton stone. The carving has been done under the superintendence of Mr. P. Honan, of Chester, who has the altar in hand. The present accommodation is for 1,100 persons. The contractor was Mr. Charles Walker, of Arthur-street, Preston.

KILDARE CATHEDRAL.—A meeting was held at the courthouse, Kildare, for the purpose of raising funds to complete the restoration of St. Bridgid's Episcopal Cathedral—a building erected in 1229, but allowed to fall into ruin in the 17th century. About twenty years ago £7,000 was subscribed, and the work was commenced, but was suspended, and in December, 1890, a fresh effort was made and another £2,000 was contributed, while the present proposal is to obtain a further £2,000 for the completion of the choir. The committee's report stated that the new choir is being built by Mr. Henry Sharpe, under the superintendence of Mr. J. F. Fuller, F.S.A., diocesan architect. The character of the old masonry is being reproduced as closely as possible in the new, and the architectural features of the building are preserved. The east wall is

pierced by three single-light lancet windows. There are two single lights in each flank. The crenulated finish to the stonework at the level of the eaves will be continued as on the nave and transepts, and the stepped gable will terminate with a cross. Inside it is proposed to finish the walls without plaster. Caen stone arcading carved in diaper work will cover portions of the north and south faces, and run across the east end to the level of the window-sills. On the south side the divisions form the sedilia and credence table. Each compartment is surmounted by a trefoil head and gable, with carved finial. The portion of the arcading immediately behind the holy table has a greater projection from the face of the wall, and is divided into quatrefoiled panels, finishing under the centre light with a crenulated cornice, the whole forming a reredos. The present contract embraces but a portion of the work to be done, but will, when finished, leave this ancient cathedral complete, so far as the structure is concerned, and in the cruciform shape in which it stood before its destruction in 1641. Much, however, remains to be done internally—the finishing of the walls of the nave and transept, filling the windows with rolled cathedral glass, laying a concrete floor and tiling, putting in adequate heating apparatus, stalls, seating accommodation, and an organ.

SOUTHPORT.—The scheme for the erection of a new infirmary in Southport has taken a practical shape. The plans sent in by Mr. C. S. Ingham, of Manchester, have been adopted by the general committee, and working plans are now in course of preparation. The committee originally decided that the cost of the building (apart from furnishing) should not exceed £12,000, but the expenditure will be much greater. The beneficiaries of the Scarisbrick estate have given the site (on Scarisbrick New-road), which is valued at £5,000, and the subscriptions already promised amount to £15,400.

TENBY.—The foundation stone of the new Roman Catholic Church to be built in the Potter's Field at Tenby was laid on Wednesday week. The principal dimensions of the church are:—Chancel, 20ft. by 18ft. 6in.; sacristy, 15ft. 8in. by 12ft.; nave, 63ft. by 30ft. On the south side will be a side chapel and the confessional. The east end will abut on the road, the sanctuary being lighted by two single-light windows. It will have an elevation externally of 47ft., the front being furnished with carvings of saints, the centre niche being filled with a full-sized figure and ornamental carvings. On the south side of the nave will be an arcade, preparatory to the extension of the building by an aisle. In the west end there will be a four-light window, over a gallery, the latter being approached through a turret stair. The turret stair will have an elevation of 40ft., surmounted by a spire 20ft. in height. The church will be built of native stone, with Bath stone dressings for windows. The architect is Mr. F. A. Walters, F.S.A., 4, Great Queen-street, Westminster, and the contractor, Mr. Geo. Richards, builder, Tenby. The cost of the building, exclusive of the site, will be upwards of £2,600.

It is proposed to build a theatre to seat 2,200 people near the Tate Free Library in Brixton-road. The building is to be of red brick with stone dressings; the lighting will be by electricity, and the auditorium is to be free from columns. Messrs. Crewe and Sprague are the architects, and Messrs. Newman the builders.

The Bristol rural sanitary authority have under consideration a scheme for a supply of water for Wotton-under-Edge, to be derived from Hamlin's Brake. Mr. Cotterell, C.E., of Bristol, has prepared the plans and report, and estimated the cost at £6,500.

During last week operations were commenced on the Middlewich section of the North Staffordshire Canal in connection with the scheme for widening and deepening the whole length of the canal from Preston Brook to the Potteries, a distance of about 30 miles. About 500 men are now at work on No. 1 section, which is twelve miles in length, and extends from Middlewich to Anderton. It is intended to widen the canal to a uniform width of 45ft., and to make it a uniform depth of 6ft., so as to allow of the passage of steam barges carrying about 80 tons. This will necessitate extensive alterations, as all the locks have to be widened from 7ft. (as at present) to about 16ft., and the numerous bridges along the canal will have to be taken down and rebuilt. The alterations will cost over £50,000.

Engineering Notes.

THE COST OF THE MANCHESTER SHIP CANAL.—The special committee of the corporation charged with the consideration of the affairs of the Manchester Ship Canal submitted an important report to the city council at its meeting on Wednesday. The report gives detailed statements concerning the financial position of the company, and the estimated cost of works and equipment to open the canal for traffic to Manchester. The estimate of the engineers, Mr. E. Leader Williams, chief engineer of the Canal Company, and Mr. George H. Hill, engineer to the corporation, is that from the 1st June last until the 30th December, 1893—the date at which it is expected the canal will be completed—the total outlay on the works will be £2,182,433. They add that this estimate does not provide for any contingencies such as damage by floods other than a sum of £85,000, which is included in the amount of the total outlay. It appears from this that in addition to the loan of three million already arranged by the Manchester Corporation, a sum of £1,489,282 will be required for the completion of the canal. Consideration of the report has been postponed till Sept. 7th.

CHIPS.

The building to house the Althorpe collection, Mrs. Ryland's gift to Manchester, has for some time been in course of erection on a site between Spinningfield and Wood-street, Deansgate, Manchester. The architect is Mr. Basil Champneys.

The last day for sending in competitive designs for the municipal technical schools at Manchester was Tuesday in this week.

The music-hall in Oxford-street, W., has been pulled down, and will be replaced by a new one built on modern plans, and seating nearly 2,000 persons. Mr. Frank Kirk is the contractor. The memorial stone was laid on Monday by Mr. Charles Morton.

Damage to the extent of over £10,000 was occasioned by the fire which occurred on Monday at Mr. L. Duke's premises, the Alexandra Timber Wharf, on the banks of the Regent's Canal, Hackney.

At Worcester, Ernest W. Sumner, a builder, was committed for trial on Friday, at the assizes, charged with having incited William Sampson, one of his workmen, to set fire to a workshop on August 4. We gave the evidence for the prosecution last week.

The repaving and recausewaying of London Bridge were commenced on Monday, and will occasion some public inconvenience till the end of next week, as only one line of traffic in each direction is allowed in the meanwhile. The contract has been taken at about £5,000 by Messrs. Mowlem and Co., whose men will be employed night and day during the fortnight required for the operations.

The foundation stone of an infants' department which is being added to St. Saviour's Church schools, Herne Hill-road, Camberwell, was laid on Tuesday week. The schools will accommodate 100 infants. Mr. J. R. Manning, M.S.A., is the architect, and Mr. Rodwell the builder.

The corporation of Cardiff have unanimously decided to retain for themselves powers obtained under a provisional order, and electric-light works are to be started at once for supplying current on the moderate high-tension system within the compulsory area of the town. A plan has been prepared by Mr. W. H. Massey, electrical engineer, and the scheme will be carried out by the borough engineer and his staff.

Bruce Castle Park, Lordship-lane, Tottenham, recently acquired by the Tottenham Local Board at a cost of £15,000, to be defrayed out of the rates, was on Saturday thrown open to the public. The park is well timbered and nearly 20 acres in extent. As the name suggests, it contains the modernised remains of the castle built by the grandfather of King Robert the Bruce.

A Royal charter has been granted for the incorporation of Torquay and Southend-on-Sea as boroughs.

The name of Mr. Murray Wyatt Marshall, timber merchant of Godalming, Andover, and Haslemere, has been placed on the commission of the peace for the first-named borough.

The parish church of Stoke-next-Guildford was reopened by the Bishop of Winchester last week, after the reroofing of the nave, and the removal of the organ from the western gallery to the chancel, and the reconstruction of the instrument. Mr. R. Wood, of Guildford, carried out the building operations at a cost of £350, and Messrs. Bishop and Son, of Marylebone-road, N.W., the organ repairs at a further cost of £260.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 8dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL, XLII, XLVI, XLIX, L, LI, LIII, LIV, LVII, LIX, LX., LXI, and LXII may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—G. M. and B. R. Co.—Geologist.—B. S. P.—J. W.—F. T. B. Co.—Lancastrian.—W. T. (Truro).

Correspondence.

A CORRECTION.

To the Editor of the BUILDING NEWS.

SIR,—In your issue of the 12th inst., under the heading "Chips" on p. 235, you state that the parish church of Bourton-on-the-Water is being re-seated and restored by Mr. George Poole, contractor, of Bourton-on-the-Hill.

The real facts of the case are that the church of Bourton-on-the-Hill is being re-seated in pitch-pine by the village carpenter, Mr. George Poole, from my designs and instructions. The fine old church is not being restored or touched in any way, and the church at Bourton-on-the-Water, some eight or nine miles off, has nothing to do with the matter at all. This latter has been restored by Mr. T. G. Jackson.

I shall be glad if you will correct this in your next issue.—I am, &c., E. GUY DAWBER.
22, Buckingham-street, Strand, W.C., Aug. 13.

Mr. S. Towson, surveyor to the Erith Local Board, has been appointed surveyor to the Cheshunt Local Board.

A special service was held last week at Rolleston parish church in celebration of the completion of the restoration and enlargement; Sir Arthur Blomfield and Son, architects. A new north aisle and vestry have been constructed. The vestry is situated at the east end, and is partitioned by an oak screen. The seats and benches in, and the roofing of, the main aisle are of the same wood, while the floors are laid with tiles similar to those in the nave, which, with the south aisle, has also been provided with a fresh roof. The old walls have undergone renovation. The special gifts include a lectern of burnished brass, an oak pulpit, reared on a stone base, with brass hand-rail, and a reredos in alabaster, the latter subject being representative of the Transfiguration, executed by Mr. R. Bridgman, of Lichfield. The three-light east window has been extended.

Intercommunication.

QUESTIONS.

[10825].—**Multiplying Sketches.**—Could any reader tell me of a simple method of producing a number of copies of letters with sketches, &c.? I have tried the "stylograph," but find it unsuitable on account of the dotted line, while the gelatine copier I have is a complete failure!—F. H. S.

[10826].—**Well.**—Having a dumb well to construct about 50 yards from building (residence), and being in doubt as to best means and system of constructing it, I should esteem it a kindness of some reader would give me his opinion as to system, &c. At present I propose building it with open shaft to discharge gases 6ft. above ground, and with an arrangement for separating solid from liquid matter.—XXX.

[10877].—**Boiler.**—Will some reader tell me how to calculate the following? A boiler can be filled by two pipes—one fills it in 40 minutes, and the other in 50 minutes; the discharge-cock empties it in 25 minutes. How long will it take to fill the boiler if the two inflow pipes and the discharge cock are all open together; also if the discharge-cock and one pipe are open.—CIRCULATION.

Legal.

RESTRICTIVE COVENANTS.

RESTRICTIVE covenants in old leases are sometimes found difficult of construction, because of the changes in trade that have taken place since they were drawn up, and the different meanings that some of the old words have since acquired. This is frequently felt in the case of restrictive covenants as to the kind of business that may or may not be carried on upon the premises in question. It may be here noted that if it is intended to prevent a house being used for any other purposes than a private residence, the shortest and simplest way is to declare this by making the lessee covenant to occupy it as a private dwelling-house only, without referring to any trade or business whatever. But if it is desired only to prevent the use of the premises for a certain stated business, whether by lessor or lessee, it is advisable to define and explain the trade that is to be excluded more carefully than is often done by the use of a single word.

In a recent case ("Fitz v. Iles," *Times*, Aug. 12) an action was brought to enforce the performance of a covenant made by the lessor in a lease of 103, Bermondsey-road, and which was let to the lessee as a coffee-shop, whereby the lessor bound himself not to let any other shop in the same street over which he had any control for the purpose of a coffee-house. It appeared that the lessor had let to the two other defendants in the case No. 113, in the same road, under a lease by which they as lessees covenanted not to use the premises as a coffee-house. It appeared, however, that these defendants as such tenants were going to sell cups of tea and coffee and light refreshments generally, and were going to open a billiard-room on the premises. The plaintiff now applied for an injunction to restrain the defendant his lessor from letting these premises as a "coffee-house," in breach of his covenant not to do so, and to restrain the other defendants his lessees from so using the premises. As against the defendant the lessor the Court held there was no case, because he had put a similar restrictive covenant in his lease to his tenants, and had bound them not to open as a coffee-house; but the Judge granted the injunction asked against the other defendants, these tenants, because he thought their business was substantially a breach of the covenant, taking the old word, "coffee-house," in its modern meaning, of a place where cups of tea and coffee could be obtained.

FRED WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning to insure answer same week.

A museum was opened at Hastings on Tuesday on one floor of the Brassey Institution. The articles on exhibition include the original charter granted to the borough by Queen Elizabeth, and a case of coins of Sussex mints of the time of Athelstan, contributed by Mr. Barlow Webb. Sir Anchtel Ashburnham lends a cloth of gold, part of the corporation canopy used at the coronation of George II. in 1727. The museum has also been enriched by the Rev. J. W. Tottenham, Mr. Felix Joseph, Mr. Charles Dawson, and others.

LEGAL INTELLIGENCE.

FREEDHOLD LAND AT LEYTONSTONE.—Surveyors' Institution, June 23rd and July 14th (before Mr. Charles Bidwell, F.S.I., of Ely and Cambridge, umpire; Mr. Herbert H. Fuller, F.S.I., of 15, Serjeants' Inn, Fleet-street, E.C., arbitrator for the claimant; and Mr. Howard Martin, F.S.I., of the firm of Messrs. Thurgood and Martin, 27, Chancery-lane, W.C., arbitrator for the railway company.)—Taylor v. Tottenham and Forest Gate Railway Company.—The claimant in this compensation case was Mr. Richard Taylor, of Landermere-villas, Granleigh-road, Leytonstone, Essex, and his claim was laid in respect of a parcel of freehold land (with old buildings thereon) situate in Granleigh-road, Leytonstone. The property is about half an acre in extent, or 18,500sq.ft., and had been used by the claimant for eleven years past as a machinery depot. Mr. Atherley-Jones, M.P., and Mr. C. E. Seth-Smith (instructed by Messrs. Morse, Hewitt, and Farman, 37, Walbrook, E.C.) appeared for the claimant; and Mr. H. F. Dickens, Q.C., and Mr. R. J. Parker (instructed by Messrs. F. C. Matthews and Browne, 151, Cannon-street, E.C.) represented the railway company. The case occupied two complete days—viz., June 23 and July 14—and the witnesses examined on behalf of the claimant were Mr. E. H. Bousfield (Messrs. Edwin Fox and Bousfield, 99, Gresham-street, E.C.), Mr. Richard Taylor (the claimant), Mrs. Ada Wallace, Mr. F. Alchin (engineer), Mr. H. H. Fuller, F.S.I., Mr. G. F. Morris, F.S.I. (Messrs. Protheroe and Morris, 67 and 68, Cheapside, E.C., and Leytonstone), Mr. E. F. R. Wyld (Messrs. Wyld and Venables, 69, Moorgate-street, accountants), and others; and the witnesses for the railway company were Mr. Daniel Watney, F.S.I. (Messrs. Daniel Watney and Son, 33, Poultry, E.C.), Mr. Howard Martin, F.S.I., Mr. Christopher Oakley, F.S.I. (Messrs. Daniel Smith, Son, and Oakley, 10, Waterloo-place, S.W.), Mr. Wilfred Airy (civil engineer, Great Queen-street, S.W.), Mr. A. A. Hollingsworth, and Mr. George Shead, accountant, of Laurence Pountney Hill, E.C. From the evidence it appeared that the property had been in the claimant's possession as freeholder since 1831, and that it was partially covered with buildings consisting of stables and a large barn, all of them being ancient brick structures. There was also a large yard, and the claimant let off a portion of the premises, and carried on his business as a dealer in, and repairer of, boilers, engines, and other machinery. The land was alike valuable both as trade premises and as eligible building land. Mr. E. H. Bousfield valued the land, as partly trade premises and partly building sites, at £2,552. Mr. H. H. Fuller valued the land at £2,820, and Mr. G. F. Morris made the total value £2,904. In the claim was included an item for loss sustained by the claimant on a forced sale of his stock-in-trade, and there was also a claim in respect of goodwill. The evidence adduced on behalf of the railway company as to the value of the land was as follows:—Mr. Daniel Watney valued the same at £741; Mr. Martin valued it at £708; Mr. E. L. Curtis valued it at £718; and Mr. Christopher Oakley valued it at £686. The claimant gave evidence to the effect that he had raised the sum of £900 on mortgage of the premises about four years ago. He further gave evidence as to his trade claim and the earnings of his business over a period of three years, and was cross-examined at great length. Mr. Wyld stated that he had examined the claimant's rough day-book (this being the only book kept), and he found that the gross sales for 1888 amounted to £1,869, in 1889 the amount was £3,049, and in 1890 the gross sales were £2,462. Mr. Charles Bidwell has awarded the claimant the sum of £2,345.

TAXATION OF ARBITRATORS' FEES.—In the Queen's Bench Division, on the 11th inst., an application was made *in re* an arbitration between Prebble and Robinson and another. Mr. Moyses, for the defendant, said this was an arbitration between a builder named Prebble and Messrs. Robinson and Fisher, and the question raised was whether arbitrators' fees were subject to taxation. The Master and the Judge at Chambers had held that they were not, and therefore the present appeal. The two arbitrators and the umpire, who were all surveyors, sat at the Imperial Hotel for one day for five or six hours, and for two hours upon a second day, and their charges amounted to £153 odd. The award was that Robinson and Fisher should pay Prebble £310 and costs, and the amount of their charges was paid by Prebble to take up the award. The amount was included in the costs, and upon taxation defendants objected to the amount, but it was held that the question could not be gone into in view of a recent decision. Mr. Marshall, for the plaintiff, said no doubt the arbitrators only sat a day and a part of another day at the Imperial Hotel, but the arbitrators and the umpire had previously met on the spot for the purpose of measuring up the work. Afterwards, moreover, the arbitrators met the umpire for two days, and the award had to be drawn up and submitted to counsel. The £153 also included an amount for the hire of the room, so that upon the whole it might be found to be reason-

able. The Lord Chief Justice and Mr. Justice Cave concurred in allowing the appeal.

BANKRUPTCY OF AN ILFRACOMBE ARCHITECT.—At Barnstaple Bankruptcy Court on Thursday in last week, the case of Joseph Yeardye, architect, of Ilfracombe, was called. The statement of accounts showed that the gross liabilities of £2,824 1s. 11½d. were made up as follows:—Unsecured creditors, £458 10s. 7½d.; fully secured creditors, £1,870; partly secured, £330; contingent liabilities, £132; rent and wages, £33 11s. 4d. The liabilities expected to rank for dividend were £580 10s. 7½d., against which were placed assets amounting to £885 0s. 8d., giving a surplus of £300. £310 of the assets represented surplus from securities in the hands of creditors fully secured.

RE W. F. CONEY.—An adjourned first meeting was held under this failure on Friday. The debtor, a builder and contractor, carrying on business in Fore-street, City, returned his gross liabilities as £25,225, of which £22,255 are treated as fully secured, and assets £1,020. The debtor commenced in December, 1888, with a capital of £500, and his business has consisted in contract work and speculative building in London. A composition of 7s. 6d. in the pound was accepted, payable in two instalments at one and four months.

RE JAMES GREENWOOD.—The bankrupt, who traded as a builder and contractor at 86, Cannon-street, City, and Maltby-street, Bermondsey, under the style of James Greenwood and Son, failed in November last, and applied for his discharge on Friday. Proofs amounting to £5,525 have been made, and the trustee reports that the assets will realise about £9,000, that a dividend of 10s. in the pound has been declared, and that a further dividend of 10s. will be paid. No offence was reported, and Mr. Registrar Hope granted the bankrupt his immediate discharge, together with a certificate that his failure was due solely to misfortune, without misconduct on his part.

IMPORTANT ARBITRATION CASE AT ILFRACOMBE.—**LE LIEVRE AND DENNES V. W. H. GOULD.**—This case, which was referred by Mr. Justice Hawkins on July 2nd, came before Mr. Edward Ridley, Q.C., an Official Referee of the High Court of Justice, at the Town Hall, Ilfracombe, on the 10th inst. The parties were Mrs. Caroline Margaret Le Lievre and Edgar Thomas Martin Dennes (plaintiffs) and W. H. Gould, architect and surveyor, of Ilfracombe (defendant). The action was one for damages for giving certificates which were not trustworthy in the matter of houses at Kingsley-avenue, Ilfracombe. Mr. Montague Lush, in opening the case, stated that Mr. Hunt, of London, was the architect of two houses at Kingsley-avenue, adjoining the Wildercombe Park Estate, and the builder was Wm. Lovering, who, it was arranged, should be financed by the plaintiff Dennes upon certificates being given by Mr. Gould, a local surveyor, that the buildings had reached certain stages, and that they were erected in accordance with a "schedule of advances." The sum of £850 was to be advanced in eight instalments, when certain conditions had been complied with. The double capacity occupied by Mr. Gould of being surveyor to the Local Board, as well as being the agent of the plaintiff, gave him extra opportunities for seeing that the work was properly done. The work of erection by Lovering began, and after about £400 had been advanced by Dennes, he transferred the mortgage deed to the plaintiff Le Lievre, and she advanced the remainder of the sum. In November, 1891, the property was inspected by Mr. Hunt, who interviewed Mr. Gould and told him that, from what he had heard, the houses were not properly built. They inspected the property together, including the drainage, which furnished great cause for complaint, and he believed Mr. Gould expressed his own astonishment at what he saw: the whole of the drainage would have to be reconstructed; the main walls were out of perpendicular, and the houses were worth next to nothing. Judgment was obtained against Lovering in the County Court, but it was fruitless, as they could not obtain a penny. After this a formal complaint was made to Mr. Gould, who replied that he did not undertake to value, but simply gave certificates that the building had reached certain stages, and that the sums previously agreed upon to be advanced were consequently due. Counsel also asserted that Mr. Gould was acting in a third capacity, as builders' merchant, and supplied Lovering with lime and other material. This was not vital, but would serve to show that they were inducements to tempt Mr. Gould to be more free in granting certificates than he otherwise might have been. The Court then adjourned to inspect the buildings, after which Mr. Hunt was called, and corroborated the counsel's statement as to Lovering being financed by the plaintiffs. He afterwards visited Ilfracombe, and examined the buildings, when he found them in a very unsatisfactory condition. Mr. Gould informed him that he had only been paid the sum of 5s. per certificate to report on the progress of the building, and not on the matter of the structure. Mr. Arnold Thorne, F.R.I.B.A., of Barnstaple, said he surveyed the houses in Decem-

ber, 1891, and found the mortar was of a very inferior quality, and hardly contained a vestige of lime: the walls were not perpendicular, and no special provision had been made to keep out the damp. The drainage also was very bad, and he considered that the certificates must have been given in total ignorance of the condition of the building. It would require at least £200 or £250 to make the houses at all habitable. Mr. Harbottle, of Exeter, county surveyor, corroborated the last witness.—On Thursday, the 11th inst., Mr. Finch made a speech for the defence, and evidence was given by Mr. Joliffe, mason, and Mr. Gould. The Official Referee, in giving judgment, said Mr. Gould was certainly much to blame for the negligence he had shown, and he should have given judgment against him in the sum of £300 damages had it not been for a technical objection, which was that he decided that Mr. Dennes, in so far as he had lost interest in the case, was not the proper plaintiff. He should, therefore, give judgment in favour of the defendant, with costs, but give the plaintiff leave to appeal to the Courts on the ground of the objection, and stay costs until September on these grounds.

ARCHITECTS' CLAIM FOR COMMISSION.—**CLEGG AND SONS V. THE INTERNATIONAL OKONITE COMPANY, LIMITED.**—At the Liverpool Assizes, on Thursday, August 11th, judgment was given in this case, which was tried on the previous Tuesday. The action was brought by the plaintiffs, who are architects in Manchester, against the defendants, manufacturers of electrical wires and cables at Newton Heath, for professional services in connection with the erection of defendants' works. The defendants counter-claimed damages for alleged negligence. Mr. Justice Denman said the claim was for £129 13s. 3d., balance of commission earned and work done by the plaintiffs, and the great question was, had the plaintiffs made out that they were entitled to remuneration at the rate of 3 per cent. commission, which was claimed, or at the rate of 2½ per cent. He had carefully looked into the matter, and had come to the conclusion that Mr. Clegg's recollection of the bargain was to be preferred. He thought the plaintiffs had made out that that part of their case, subject to any small deduction with regard to the amount on which the commission was to be claimed. The second item in the claim was for £73 6s., which was for a good many things, such as preparing drawings, original surveys, &c., and he did not think that this claim was other than a fair and reasonable one. With respect to the counter-claim, he did not find that the defendants had suffered any damage by reason of any negligence on the part of the plaintiffs. His lordship therefore gave judgment for the plaintiffs for the amount claimed on the claim and counter-claim, with costs.

IN RE WILLIAM GARDNER, EASTBOURNE.—At a special sitting of the Eastbourne Bankruptcy Court held on Monday, William Gardner, a builder, of Eastbourne, presented himself for his public examination. The gross liabilities, according to the statement of affairs, were £5,362 19s. 9d., of which only £352 14s. 1d. was expected to rank for dividend. The assets were stated to be £332 17s. 9d., showing a surplus of £20 5s. 8d. The debtor was examined by Mr. Cully, the official receiver. He came to Eastbourne eight or nine years ago from Brighton, where he had worked for Mr. Chappell. He started in Eastbourne without capital, and commenced speculative building in 1882. He had not kept books other than a pocket-book. He was closely questioned as to his dealing with the mortgagee of his property, and the examination was adjourned till Oct. 6th.

A new bank is in course of erection at Bowness, for Messrs. Wakefield, Crewdson, and Co. Messrs. T. and M. Atkinson, of Windermere, are the contractors.

At the Milverton Police-court last week, William Slater, surveyor to the Warwickshire County Council, was charged with keeping a carriage for which he had no license. He pleaded guilty, but added that he did not know the carriage was liable, inasmuch as he was allowed a horse and trap as surveyor to the County Council. The Bench thought there had been some misunderstanding, and dismissed the case on payment of 12s. 6d.

The question of providing an ocean mail steamship pier at Portishead, Bristol, is being pushed forward with vigour. The money, about £200,000, is promised by a syndicate, and a provisional contract has been entered into with Messrs. Pearson, of London, who are in negotiation for the purchase of the necessary quarries for raising the stone.

At the Kremlin at Moscow work has recently been resumed on the colossal monument in the course of erection to the Czar Alexander II. This will be 154ft. in width by 123ft. in depth, and is in harmony with the Kremlin itself, which includes features both of the Italian and the Byzantine styles. In the interior will be placed a statue, heroic in scale, of the Emperor, in green bronze, on a pedestal of granite.

WATER SUPPLY AND SANITARY MATTERS.

ELY, CARDIFF.—The rural authority, at their monthly meeting on the 10th inst., accepted the offer of the guardians of Ely schools to contribute £600 towards the drainage of the village of Ely on condition that the sewage of Ely schools was taken in. The guardians are spending about £20,000 on the extension of the schools, and are anxious about the drainage, which at present is very unsatisfactory. Mr. Fraser, A.M.I.C.E., surveyor to the rural sanitary authority, has prepared plans and estimates for a scheme costing about £1,000 and a yearly subsidy to the corporation of Cardiff of about £40 for permission to drain into their sewer, which is to be extended for that purpose. The sanitary authority also resolved to give two months' notice, in accordance with section 53 of the Public Health Act, 1875, of their intention to construct a reservoir for the supply of water for the parish of Padyr, in accordance with plans prepared by their surveyor, Mr. Fraser, A.M.I.C.E., at an estimated cost of about £1,500.

LLANDAFF.—The sewerage of Llandaff Yard and Maindy, in the district of the Cardiff Rural Sanitary Authority, is now, with the exception of the pumping-station, complete. The authorities are very anxious to connect with the joint sewer into which this part of their district is to be drained, but for some unexplained reason permission to connect is withheld by the joint board, although several applications have been made by the rural authority. The cost of this scheme will be about £3,500.

WHITCHURCH.—The Whitchurch vestry held a meeting at the board schools, Whitchurch, on the 5th inst. to consider plans prepared by Mr. Fraser, Assoc.M.Inst.C.E., surveyor to the rural sanitary authority, for the drainage of that parish. The plans, as explained by Mr. Fraser, provide for a large prospective population. The scheme is divided into nine sections, and is estimated to cost about £6,200. The meeting was eventually adjourned for a fortnight, so that the ratepayers of the parish might have a chance of inspecting the plans.

CHIPS.

The Wandsworth district board of works proceeded, on Wednesday week, to elect a surveyor at a salary of £300 a year, rising by regular increments to £450. Out of 83 candidates Mr. P. Dodd, A.M.Inst.C.E., for the past five years surveyor to the local board of Southend-on-Sea, was elected.

The town council of Aberdeen had before them on Monday plans by Mr. W. Dyack, burgh surveyor, showing various alternative sites, six in number, proposed for the Woodside public park. A site at Hilton, recommended by the surveyor, was adopted by the council. The park will be about 13-12 acres in extent, and the cost is estimated at £3,200.

The Aberdeen Town Council have adopted plans for the building of a police-court and offices on the site of the prison in Lodge-walk, at an estimated cost of £10,000.

The works in connection with the erection of a new hospital for Halifax, which have been stopped for some time owing to the lack of funds, have been resumed this week, Mr. Justice Chitty having sanctioned the proposal to sell the old infirmary and apply the proceeds to the new structure. The hospital will be on the one-storied pavilion plan, and is being erected from designs by Messrs. Worthington and Elgood, of Manchester, selected in competition. The estimated cost is £60,000, exclusive of site.

At a Consistory Court of London Diocese held on Tuesday, Dr. Tristram granted a faculty for the erection of a memorial external pulpit at the west end of Holy Trinity Church, Marylebone, and also for a baptistery at the south-east angle, and the introduction of the electric light in the same church, at a total outlay of £2,000. The Chancellor remarked that there were now very few open-air pulpits, though both before and after the Reformation they were by no means unknown. The Court, some years ago, gave its sanction to the erection of such a pulpit outside Whitechapel Church, and much good had resulted from that decision. At the same Court faculties were granted to All Hallows Barking to improve the church and to lay out the churchyard as a recreation ground, at an outlay of £3,000; to St. Giles's, Cripplegate, to make alterations at a cost of £1,200; and to Finchley Parish Church, to build a choir vestry at the cost of £300.

Messrs. Reckitt, of Hull, have informed the infirmary authorities in that town that they have agreed to purchase the large hotel at Withernsea, with 3½ acres of garden and grounds, which premises they propose to hand over for the purpose of a convalescent home. The offer has been cordially accepted.

The Metropolitan Asylums Board held a special meeting on Tuesday, when it was agreed to purchase 15 acres of land in Tottenham for the erection of a hospital to accommodate 400 fever cases.

Our Office Table.

We are able to authoritatively contradict the current rumour that it is intended to pull down Crosby Hall, Bishopsgate, for an extension of the Bank of Scotland. No such scheme of demolition is contemplated. The report probably arose from the fact that Crosby Hall Chambers, in the immediate neighbourhood, were recently removed, and are being rebuilt. They contained little of interest; part of an old ceiling was given to the authorities of South Kensington Court, while a fine chimney-piece has been carefully preserved, and will be set up in the new building to be erected on the site from the plans of Mr. William W. Gwyther, of Temple-chambers, E.C.

In the course of operations connected with the regulation of the outflow from Haining Loch, near Selkirk, there has been discovered a subterranean passage, the existence of which was entirely unknown. The subway is 6ft. in height by 2ft. 6in. wide, and its floor is 17ft. above the present level of the loch, and although the water has been lowered, it can never have been so high as this. It is supposed to have been a secret way of escape to the loch either from the Haining Tower, which was occupied by a cadet branch of the Buccleuch Scotts between 1463 and 1625, or, less probably, from Selkirk Castle on the adjoining Peel Hill. In M'Gibbon and Ross's "Castellated and Domestic Architecture of Scotland," reviewed by us last week, there are several references to similar subways, notably one at Yester Castle.

The building of a hospital for Sydney has revealed that the local hospital board and also the New South Wales Parliament have peculiar views as to what constitutes fair play towards professional men. We mentioned in May last that as far back as 1879 the design by Mr. Thomas Rowe, F.R.I.B.A., of Sydney, was adopted for the hospital, and owing to the growth of the city it was subsequently decided to increase the accommodation by 80 beds. The competition designs were thrown overboard, but Mr. Rowe was appointed architect, and instructed to prepare fresh plans, and to change the facing material from brick to stone. In 1888, when £69,000 out of an estimated £140,000 had been expended, a change of Government took place, and the new Ministry stopped the works. After a long discussion in the House, the Government instructed a Mr. Kirkpatrick to complete the undertaking, although his design was not placed in the original competition. The Sydney Hospital Board have since received a claim from Mr. Rowe for £7,000 for commission for the unexecuted works. The board decided to reply, pointing out that as they had paid Mr. Rowe over £3,450, being 5 per cent. on the portion actually built under his supervision, they considered he had been fully remunerated, and it was pointed out that if litigation should arise, it would necessarily be between Mr. Rowe and the Government, who had taken the work out of the hands of the board. Public opinion in the Australian colonies seems, from this and other incidents which have come under our notice, to be on an even lower level than it was in this country before the Competitions Memorial Committee took action fourteen years ago.

The Parisian Academy of Sciences and Arts, Paris, have awarded the First Class Grand Diploma of Honour and Great Gold Medal to Messrs. Baird, Thompson, and Co., the well-known ventilating, sanitary, and heating engineers, of London and Glasgow; and also conferred upon their Mr. J. D. Gray Thompson the title "Membre d'Honneur," this being the highest honour they could bestow in recognition of their latest improved systems of ventilation, heating, and sanitation.

During a gale in the Rhondda Valley, on Tuesday, a portion of the walling of St. Iltyd's Church at Penycraig, now in course of erection, was blown down, causing serious injury to three of the masons—a father and son named James, and another man named Bryant.

Additions are about to be made to the residence of Professor Huxley, F.R.S., in Staveley-road, Eastbourne. Messrs. Waller and Son are the architects, and Mr. J. Harding is the builder.

The name of W. Macie Leir Seaman, of Victoria-mansions, Victoria-street, Westminster, architect, appears in Tuesday's *Gazette* among the receiving orders in bankruptcy.

Trade News.

WAGES MOVEMENTS.

A UNIFORM WAGE FOR MUNICIPAL EMPLOYEES.
—At a meeting held on Sunday afternoon in Regent's Park, under the auspices of the National Union of Masons, Paviers, Settmakers, Quarrymen, and Labourers of Great Britain and Ireland, for the purpose of considering the question of establishing a uniform weekly wage for all municipal and vestry workers throughout the country, the following resolution was passed:—"That this meeting, having heard the statements of the stoneworkers, calls upon all corporations, councils, vestries, and district boards to pay a uniform weekly wage of not less than 42s. to masons and paviers, 33s. to hammermen, and 30s. to labourers; and, further, that they receive the same privilege as the officials—viz., that full pay should be given for Bank Holidays, as well as one week's holiday in the summer; that half-pay be allowed in sickness, and full pay in cases of accidents on the works; and that local bodies should appoint committees to be the courts of appeal for workmen having grievances."

BRISTOL.—The bricklayers' strike has ended, the men having agreed to return to work on condition that they give notice to all branches of the building trades in Bristol for Feb. 28, 1893, of a proposed reduction of hours to 48 in summer and 45½ in winter.

DUNDEE.—The operative painters at present employed in painting the Dundee public schools went out on strike on Monday. The dispute has arisen in connection with the Dundee School Board having accepted a painting contract for several of the schools from an employer who is alleged to be paying his men less than the standard rate of wages.

HUDDERSFIELD.—The operative masons, who came out on strike in July for an increase of 1d. per hour and half an hour off on Saturdays, have obtained the half-hour and an advance of ¼d. per hour, the advance to commence on Monday last. They have consented to an arbitration clause for the settlement of disputes being inserted in the code of rules regulating the trade in Huddersfield.

NEWCASTLE-ON-TYNE.—The builders' labourers in this city have been on strike for some time for an advance of wages and code of working rules. The master builders and contractors reopened their works on Tuesday, and employed labourers who were willing to resume work on the terms offered. Some went in, but a majority still hold out, and are supported in their demands by the local branches of the Operative Bricklayers' Society.

ROCHDALE.—To end the strike among the plasterers, Mr. W. Shepherd, secretary to the Master Builders' Association, recently offered two proposals to the operative plasterers—namely, 8½d. per hour and the old working rules or 8½d. per hour and the working rules as proposed by the masters, which rules include an alteration in place for payment of wages, extension of local boundary, and date of notice for alteration of rules. The men refuse this, demanding an advance of ¼d. per hour, making wages 8½d. per hour, and the old rules. The masters' offer to submit the dispute to arbitration has also been refused by the operatives.

CHIPS.

A new Masonic hall, specially designed by Mr. George Fenton Lambert, architect, of Bridgend and Aberavon, to accommodate the members of the Ogmere Lodge of Freemasons, has recently been opened in the former town. Special attention has been paid to the ventilation, which is carried out on the Boyle system.

The grammar school, Ormskirk, is being warmed and ventilated by means of Shorland's Patent Manchester Grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

A meeting of the joint committees of Ross, Cromartie, and Sutherland County Councils was held on Monday for the consideration of offers for rebuilding Bonar Bridge. It was moved and seconded that the offer by Sir William Arrol and Co., Glasgow, be accepted, to which an amendment was proposed that the offer by Messrs. Abernethy, Aberdeen, be accepted. On going to the vote, a majority voted for Sir William Arrol's offer to rebuild the bridge in ten months for £12,584 17s. The bridge will be in three spans, composed of bowstring steel girders, with a clear waterway of 315ft., being 55ft. longer than Telford's bridge on the same site, destroyed by floods last winter.

A memorial window has recently been placed in the south aisle of Holy Trinity Church, Bear-lane, Leeds. The subjects are "The Presentation in the Temple" and "The Agnus Dei." It is from the studio of Mr. W. G. Taylor, Berners-street, London.

DOULTING FREESTONE.
THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.
 Prices, and every information given, on application to **CHARLES TRASK and SONS**, Doulting, Shepton Mallet, Somerset. London Agent:—**Mr. E. A. WILLIAMS**, 16, Craven-street, Strand, W.

HAM HILL STONE.
 The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
 Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
 Address:—
THE HAM HILL STONE COMPANY,
 NORTON, STOKE-UNDER-HAM, SOMERSET.
 London Agent:—

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXIII.—No. 1964.

FRIDAY, AUGUST 26, 1892.

THE REPORT OF THE SELECT COMMITTEE ON THEATRES.

IT is exceedingly doubtful if the majority of our readers are acquainted with the circumstances which gave rise to the inquiry which was made during the months of March, April, and May last year by a Select Committee of the House of Commons into the operations of Acts of Parliament relating to the licensing and regulation of theatres and places of public entertainment. Since the London County Council have taken up the duties of the late Metropolitan Board of Works, they have been striving to acquire further powers than those conferred on them by the Metropolitan Management and Building Acts Amendment Act, 1878, Sections XI., XII., and XIII., and for that reason have from time to time endeavoured to have Bills passed by Parliament giving them the entire licensing and control of all places of public entertainment within the County of London. The last Bill before the House—that of 1891—was blocked, and the Council obtained the consent of the House to the inquiry of a Select Committee. The report of this committee has just been published in the form of a Parliamentary blue-book, and as there are many matters referred to therein of vast importance to the architect, we purpose reviewing the contents of this volume for the information of our readers.

In the year 1877 a Select Committee of the House of Commons held an inquiry, under the presidency of Sir H. Selwin Ebbeson (now Lord Rookwood) into the management of the Metropolitan Fire Brigade. This committee recommended that no new theatre or music-hall in London should be finally licensed until the Metropolitan Board of Works had certified that in respect of position and structure it satisfied all due requirements for protection against fire; it also advised that the Board should have power to call upon the owners of existing theatres and halls to remedy such structural defects as might appear to be a cause of special danger, and capable of being remedied at a moderate expense. Acting upon these recommendations, the late Board introduced and passed the amendment to the Building Act above mentioned, which gives the present Council their authority over places of public resort; and the passing of the Local Management Act in 1888 placed the licensing of music-halls and certain theatres in the hands of the Council.

The chief objects of the Bill of 1891 were to codify the existing law applicable to theatres and music-halls; to adapt the same laws to theatres and music-halls so far as it was possible to do so; to give the Council power to insist that buildings used for public entertainments should be structurally fit for the purposes intended, and that they should be kept so; and to compel the proprietors to take the precautionary measures necessary for the protection of the public from fire and accident.

It is requisite, before considering the important evidence given before the Select Committee this year, to understand fully what provisions the Council's Bill made as to structural matters, which alone affect the architect, leaving out of the question all matters relating to management and supervision of morals. Referring, then, to the structural part of the Bill, it was proposed that the provisions contained in the Acts of 1878 and 1882 (41, 42 Vic. c. 32; 45 Vic. c. lvi.) should be re-enacted; but as these

powers were contended by the Council to be insufficient in practice, on the grounds that the structural alterations thereby permitted must be limited to such as can be carried out at a moderate cost, and also because the Council have no power to inspect a theatre or music-hall day by day if necessary—it was proposed to confer power upon the Council to make annual or more frequent inspections, and to insist on alterations being done if deemed necessary for the protection of the public safety. The right of appeal to the Home Secretary, which now exists, was retained, and no place was to be allowed to be kept open unless duly certified as to its structural stability, security against fire, and facility of ingress and egress.

The Bill further provided for the Council to retain the power to frame regulations for insuring the safety and accommodation of the public, and to appoint inspectors for the purpose of seeing that the arrangements made for the public safety were properly maintained, and that rules for insuring order and decency were observed, as well as regulations relating to means of exit, provision of fire appliances, and subsidiary lighting of the passages by oil lamps in the event of the extinction of the gas or electric light.

Further provisions were made for the control over the manner in which the audience should be disposed in the building, and the number of persons that should be admitted, and that no alteration in the position on plan of the fixed seats should be made until plans of such alteration had been submitted to, and approved by, the Council. A clause was inserted forbidding the blocking of gangways.

The Bill also referred to the payment of costs of structural alterations. The owner was to be liable in the first instance, but he was to give notice of the requirements to the reversioner, and both were allowed the right of appeal, and charged by way of annuity on the premises, the apparent object of which provision was to allow a fair method of dealing with such charges, as the costs, it has been stated, often fall upon a person who has but a short term, and the object was to throw the expense upon the person who is permanently benefited. The occupier for the time being would have to pay the rent-charge, but in return for this would be exonerated from the capital expenditure, which he would otherwise be liable for if the owner refused to do the work, unless, indeed, he preferred to close the premises.

This Bill further asked for powers to enable the Council to insist that all licensed premises should be kept in a fit and proper sanitary condition. Such were the main provisions which concerned the architect, and on the evidence on these points alone we now wish to deal.

Mr. T. G. Fardell, who was Chairman of the Theatres and Music-halls Committee of the Council for three years, gave very detailed evidence, explaining the provisions of the 1891 Bill, as well as of the other measures, which both the late Board and the Council had tried to make law. Mr. Fardell showed, in replying to the many questions put to him, an intimate knowledge not only of the various laws and enactments at present governing places of public entertainment, but a practical acquaintance of the requirements for public safety in theatres, &c., that could scarcely have been expected from a layman. It is evident proof that during the term of his chairmanship he had studied the subject from practical grounds. After a full recital of the present law, this gentleman explained that the Council had not sufficient power in structural matters, on account of the restriction imposed by the present Act of 1878 that only such alterations can be insisted upon as can be executed at a "moderate expense," because it had been found in practice that very large expenditure had at times been necessary to make the

place at all compatible with public safety, and it was mentioned as an example that the proprietors of the Gaiety Theatre had expended £8,000 to meet the requirements of the Council. Mr. Fardell paid high tribute to the lessee of this theatre and of the Lyceum for the manner in which the proprietors of these theatres had given the Council every assistance in providing for the public safety, and he said, "If the proprietors had relied upon the provisions of the Act, that everything should be carried out which only involved a reasonable expense, I take it that there might have been very considerable difficulty on the part of the Council in forcing them to do it. The only way it could have been done was by the Council approaching the Lord Chamberlain, and asking him to use his influence and power of refusing a license, without giving any reason whatever, to these two theatres"—an extreme course, we should humbly submit, most unlikely for his lordship to take.

The next point of importance put forth by this witness was his desirability for the appointment of a standing arbitrator to decide any disputes arising as to structural matters between the Council and the proprietors, so as to insure continuity of practice and authority, and that one person might not decide in one way and another in another. It was then explained that originally the Council was desirous of having the licensing of all theatres now licensed by the Lord Chamberlain; but that was one of the points upon which the Council gave way at the request of the proprietors and lessees of theatres. This claim, it appears, was put forward because the Select Committee of the House of Commons of 1866 were of opinion that all licensing should be by one authority. He explained that, "Under the Act of 1878 a theatre is licensed by the Lord Chamberlain; the County Council, as successors to the Board of Works, will have the right to inspect it for structural alterations and requirements; certain alterations may be deemed necessary, and, by permission of the Lord Chamberlain, they can call upon the owner to carry them out. The owner appeals against the order which will then be served, and the Chief Commissioner of Works will have to appoint an arbitrator, so that there you get three authorities. There is the licensing authority, the supervising authority, and another authority who is over the two. We say that is not right, but that the licensing authority should be the one to see that everything is in order." So far as these last words go, we most heartily agree with Mr. Fardell, for it seems but just that the proprietors should have but one authority to deal with. Whether that authority should be the Lord Chamberlain, the Council, or the Home Office, we do not attempt to say.

Speaking next of music-halls of the smaller class, which exist in the rear of public-houses, the witness drew the attention of the committee to the conflicting requirements of the licensing magistrates and the Council. We quote again from the evidence: "Now, for instance, at the October Session of 1890, I think it was, we had a man before us applying for a license for music and dancing, and we suggested, as a condition of giving him the license, that he should make certain alterations. I believe they were in process of negotiation at the time; no real objection was made. We heard from him the following December that he was not in a position to do anything till the following March, when the justices met."

The question of the desirability of placing open-air shows and fairs under the Council's license was next dealt with.

There has always appeared to our mind great and unnecessary inconvenience to licensees in the inability of obtaining a license except at a fixed time (October) once a year. Suppose applicants fail to apply in October,

and their plans are not ready, or even matured, and they want to open the place to the public in the following spring or summer, as in the cases of exhibitions, then they have to postpone their "show" for twelve months and lose a whole year's takings. In the case of the Military Exhibition, the authorities did not apply for a license till the following spring, as it did not occur to them before that they would need a music license. They could not, of course, obtain one, and but for the power conferred on the Secretary of State, both that important exhibition and the Naval Exhibition would have been without music. Music licenses, like dramatic licenses, should be obtainable at any period of the year.

The desirability of improvement in the sanitation of our public buildings must be admitted on all hands, and Mr. Fardell argued that the clause relative to this was probably one of the most important alterations proposed in the Bill. He referred to Mr. Lennox Browne's paper on this subject read before the Congress of Hygiene last year, a full report of which appeared at the time in the *BUILDING NEWS*, in which the inadequate provision for dressing-rooms and the faulty situation and defects of the sanitary arrangements of many well-known theatres were described and illustrated. The lack of ventilation to rooms behind the scenes, the carelessness of *employés* in matters of sanitation, and other points were dwelt upon.

The importance of Mr. Fardell's evidence cannot be overlooked, as although the Council have failed to obtain what they asked for, up to the present, there can scarcely be any doubt but that it is only a matter of time when this will become a part of the London Programme of the Progressive Party in the House of Commons. In the present Commons this party is fairly represented, and there is more chance now for a new Theatres Bill for London than there was six months ago. Therefore we think it necessary to fully consider and carefully weigh all the points of this evidence, as Mr. Fardell, in spite of his Conservative political views, is the father of the Progressive Theatre Bill.

The next point considered by the Select Committee was as to the continuance of requisitions, year by year, being served upon the proprietors; and the witness said that in his opinion, upon a certificate of the superintending architect of his Council that all the works required by the Council had been done, the licensee should not be called upon to do anything more for five years. This appears to us a fair measure, for, provided no unauthorised alterations were made, if his works were really thoroughly done in the first instance they would never require re-doing. One thing, however, was observed, that the advance of modern ideas might introduce unthought-of improvements, and new demands might accrue therefrom, which is perfectly feasible.

Attention was next drawn to the fact that frequently after plans are approved deviations are made; but all architects know how that, in carrying out works, alterations from the original plans are at times necessary. It would appear that the Council require notification of such alterations for their consideration, and this is a point that architects having dealings with the Council should bear in mind. The licensing of a building to hold a fixed number is a self-evident provision for the benefit of the public themselves, as it obviates the evils of crowding and the obstruction and blocking of exits and gangways. How the managers would look upon this is not a matter which need concern us here. These and such-like provisions for safety should be enforced in all places where the public assemble, whether theatre, music-hall, lecture-room, church, chapel, or other place of public meeting or resort. Mr. Fardell pointed out that the

object of restriction in regard to the alteration of fixed seats is that it occasionally happens that a large number of seats are added, which materially obstruct the means of egress and ingress, and he further argued as to the desirability of allowing only a certain number of persons in a certain area at a certain time.

He further described from his personal knowledge buildings he had visited in his official capacity as Chairman of the Theatre Committee, and showed a detailed acquaintance with the arrangements. The whole of the evidence may be summed up in the reply to the questions as to placing the licensing under one authority. "Personally," said Mr. Fardell, "my own view is that there should be only one licensing authority for theatres and music-halls, and that everything, both structural and licensing, should be under one authority." We fully concur with the opinions expressed of the desirability of extending jurisdiction to all public buildings, whether licensed or not, for public safety is as important in a church as in a music-hall, as examples of disasters occurring in unlicensed premises are numerous, and our readers will remember the fatal catastrophe at the Hebrew Dramatic Club, Spitalfields.

Mr. Fladgate, who gave evidence on behalf of the theatrical managers, objected to the Council being the licensing body, because it was a fluctuating body of an elective kind, which might be affected by changes of popular feeling. Granting this, it must not be lost sight of that, although the members of the Council may come and go, the officers and advisers remain. The desirability of a State department controlling all the theatres in the country as well as those in London was argued, as the regulations of one town do not agree with the rules of another, and architects who are not local men find difficulty in complying with the provisions of the various authorities. One common authority for the whole land certainly appears to be a most desirable enactment.

Mr. Irving pointed out the desirability of the technical knowledge required by architects who inspect and report upon theatres, and while some witnesses complained of the lack of technical training in the superintending architect's department of the Council, others spoke highly of the abilities of the architect himself, Mr. Blashill, who had acquired considerable celebrity in the profession long before he was appointed architect to the Council, and of the technical knowledge of his assistant, Mr. Woodrow, who, Mr. Fardell explained, was trained under an architect very well known in London in connection with theatres, and who was also the author of several papers on the subject.*

It does not seem to us necessary in this *résumé* of the Select Committee report to dwell upon that part of the evidence given by Mr. Blashill respecting the *modus operandi* adopted by him and his staff in making inspections of, and reporting upon, the internal arrangements of the various places of amusement in the Metropolis. It was stated that the disposition of the Council was to relax rather than to increase the stringency of any of the requirements set forth in the superintending architect's reports. One statement of Mr. Blashill's we should not pass over, which referred to the fact that the seating accommodation of the various music-halls has been reduced by 77,000, owing, in a great measure, to the inability of the proprietors of unsafe buildings to comply with the requirements of the architect's department. This, we take it, is a strong proof that the safety of the public receives every attention at the hands of Mr. Blashill and his assistants. It may be interesting to architects to note that it was

given by this important witness as his opinion that for sanitary purposes a theatre is subject to the ordinary sanitary authority of the district, and that the interference of the Council in such matters is not necessary. In cross-examination, the witness showed that, in spite of the many and onerous duties he had to perform, he placed such importance upon this branch of his department as to give it a great deal of personal time and attention. Evidence was also given of the "views" held by the committee themselves.

On the question of charging on the premises the cost of structural alterations to places of public entertainment as a terminal annuity for thirty years, Mr. Arthur Cates gave evidence on behalf of the reversioners. He was of opinion that it would not in all cases be reasonable to charge the cost in this manner, and that the position of the reversioner, who may not derive any future benefit from the alterations, should be taken into account; the reversionary interest should not in any case be subjected to the proposed charge, unless it can be definitely shown that such interest would be benefited by the works.

The evidence given by Mr. Phipps was principally a contention that the inspection of theatres, &c., should be under a Government department, such as the Home Office or the Board of Trade, and that properly qualified inspectors should be appointed, as in the case of mines, factories, and railways. He dwelt very fully upon personal cases he had had before the Metropolitan Board and the County Council, and complained of the want of practical knowledge of the members of the Theatres Committee. He, however, paid tribute to the abilities of Mr. Blashill, and his assistant, Mr. Woodrow, and gave it as his opinion that the superintending architect was not intrusted with sufficient authority, being too much trammelled by the committee.

Mr. Emden gave details of cases which he had personally had to deal with, and stated that while, in his opinion, the Council might reasonably be intrusted with the carrying out of the Building Act, he did not consider them the proper authority to deal with the question of exits, entrances, &c. He also gave it as his opinion that the question of isolation of a place of amusement is not so important as that of making the walls thick enough to be practically fireproof, and of providing proper and efficient arrangements as to the supply of water. In our humble opinion this disregard of the question of the suitability of site is entirely wrong, for unless the site is a good one, how can the means of exit be well arranged?

It is strange that there was such a lack of evidence given with regard to provincial theatres, many of which we know to be in a most unsatisfactory condition. The unfitness of some of these houses was shown by Mr. Simpson, who mentioned by name many wooden theatres that were licensed by the magistrates in the country. This witness thought that one authority, and that a London one, ought to pass all plans of buildings for public amusement. Local magistrates really knew very little about the subject, and local architects very seldom built theatres. One remark was made by this witness: that in course of time the exits from all new theatres should be almost in the same position, so that visitors would really get to know the very best way out of a theatre by their being uniform. We cannot go quite so far as to agree that all theatres should be cast in the same mould; but we think symmetrical planning should be observed.

So far as the evidence given before the committee is concerned, we must conclude with a few remarks on that given by Captain Simmonds, the chief officer of the Fire Brigade, who argued at some length on the

* The present series of papers on theatres now appearing in our issues are from the pen of Mr. Woodrow.

desirability of employing men of the Fire Brigade in theatres, and suggested that the chief officer of the Brigade should be intrusted with the supervision of the fire appliances. The increased cost of this supervision to the ratepayers was shown to be £30,000 a year. It is true that where the public know that the firemen employed are experienced men, there will always be a tendency to allay any panic that may arise. The employment of firemen for other than their legitimate duties is undoubtedly wrong, as it takes the men away from the constant watch which is necessary in a building containing so much inflammable material.

There appears to be a general view that one authority should deal with everything in connection with theatres, &c., and we thoroughly endorse that view. What that authority should be was left for the Select Committee to decide after hearing the arguments of the witnesses which we have cited, as well as many more. We must confess that the recommendation arrived at on this point is not to us a satisfactory solution of the difficulty. The committee were of opinion that the magnitude and expense of the establishment of a separate department of State would have to be considered; but that, apart from this, great weight must be attached to the general policy which has of late years been pursued by the Legislature in the direction of confiding to local bodies throughout the country a wide control and large responsibility with regard to local management, especially in all questions of the structural safety and suitability of places of public resort; for this reason the establishment of a centralised department over the country was not advocated by the committee. "We have full reason to believe," the report proceeds, "that the existing law for licensing and regulation of theatres and places of public entertainment (outside the County of London) has, when the local authorities have properly availed themselves of it, been found on the whole satisfactory."

After calling attention to the peculiar circumstances which call for special consideration by Parliament of the question of the Metropolitan places of entertainment, an account of the large number, the amount of capital risked in the enterprise, the number of persons employed, and the multitudes of people who attend, and citing the provisions of the present Act, the report goes on to say that it is admitted on all hands that within the last fourteen years many places of entertainment in London have been properly closed, because the proprietors could not comply with the requirements made for the public safety, and that there has been a great advance in all structural matters in those which are now open. The credit of this is no doubt mainly due to the zealous efforts, first of the Metropolitan Board of Works, and afterwards of the County Council working through the Theatres Committee. It is acknowledged that it is perhaps inevitable that as a result of these efforts controversy should arise between these bodies and the owners of theatres. Should any future dispute arise, the committee agree with the Council that a standing arbitrator should be appointed, permanently attached to Her Majesty's Office of Works, and under the general direction of the First Commissioner, who should be answerable to Parliament for his action. The Committee also strongly recommended that in the exercise by the Council of its functions as regards structural matters generally, the professional adviser of the Council should be given, as far as practicable, a position of independence, a free hand, and an undivided responsibility, in order to secure a uniform policy and procedure and to avert causes of controversy, either with the licensing authority or with the owners of theatres and music-halls. With these provisions we heartily agree.

Referring to a period of grace of five, seven, or ten years which a certificate of safety should procure for a theatre, &c., the Committee again agreed with the Council. "We also agree that the Council should have a staff of fit and proper persons to act as inspectors of the safety of theatres and places of public entertainment, who should, in our opinion, be permanent officials, carefully selected for that purpose, and we recommend that an inspection prior to licensing day should be conducted by experienced architects."

The Committee evidently found it difficult to decide who should be the one licensing authority. As regards theatres, they recommend that the Lord Chamberlain's authority should continue to be extended to all theatres in the County of London; but as regards music-halls, &c., the authority should be a small standing joint committee of the County Council and of the Quarter Sessions, consisting of an equal number of members appointed by the Council and of justices appointed by the Quarter Sessions. "Such a standing joint committee need find no difficulty in electing a chairman from among themselves under whose guidance they might, being clothed with authority to administer oaths and with judicial immunity, suitably conduct the business, assisted, of course, by the usual official information, and hearing all proper evidence for or against any applicants for licenses." Further, that all licenses should expire on licensing day, but that provisional licenses should be granted at any time.

While admitting the necessity of some reform, we cannot see that these final recommendations of the Select Committee help the matter to any appreciable extent. There would still be the County Council as the authority over structures, the Lord Chamberlain the licensing authority for theatres, and a third or new body, the joint standing committee, the licensing authority over music-halls. This arrangement would neither give the Council what they asked for, nor the theatre and music-hall people what their various witnesses desired.

One thing, however, is certain, that these recommendations will never become law, and we may look before long for another addition to the long list of Theatre Bills.

LATENT WEAKNESSES OF STRUCTURES.

THE number of building accidents bears a certain proportion, though happily a small one, to the increase of building operations; we allude especially to the failures of buildings themselves, and not to scaffold and other accidents during the erection of large structures. On the whole, it may be said that the numbers of failures have decreased, or bear a very small ratio to the increase of buildings—a diminution attributable to the more efficient and improved methods of construction, to the more effective testing of materials, competition, and other agencies. We cannot assert unequivocally that construction is better understood now than formerly, or that there is more care exercised, that buildings are more stable and solidly put together—we rather incline to the contrary opinion, if we make comparison with buildings a century old, to say nothing of those of greater antiquity; but we unhesitatingly assert that we are more scientific; our materials, though smaller in quantity, are more economically used; that in quality many of them are superior, with the exception, perhaps, of bricks and mortar; and that, at all events, the machinery, methods, and appliances we use are greatly in advance of the old ones. Building legislation and by-laws are in operation throughout the country, and have also contributed to reduce scamping, which, of course, has grown with

competition in the trades. Let us compare a modern town building with an old one of a century ago. The stone and brick and mortar may not be any better now; but we have, on the other side, cement and concrete of superior quality, the machinery and appliances for brickmaking and mixing mortar enable us to convert the raw materials to the best advantage; improved scaffolding and lifting machinery have been introduced which enable the modern builder to expedite his work as well as to insure more accurate fitting and workmanship; iron is improved in manufacture, and can be applied in a variety of forms to floors and roofs and other uses. Methods of calculating stresses and testing have enabled the constructor to avail himself of the highest results and expert knowledge. Other materials like terracotta and faience can be used.

All these agencies have materially helped to diminish risk in building; but in spite of all these improvements accidents occur, which show that perfection is impossible, and that the very advantages we possess may become a means of stumbling occasionally. To take, for example, the use of lifting machinery. The derrick crane is now generally used in the erection of lofty buildings, with great advantage in the lifting and adjustment of the load. The "jib" can be manipulated, and be moved nearer or farther from the centre with the load at the same horizontal level above the ground; but yet, in spite of mechanical provisions, accidents often occur by which the jib descends with its weight, or the chain breaks, causing often serious damage, if not loss of life—a disaster that has been rendered impossible by a recently-introduced patented jib-head, lately described in these pages. Again, in iron construction, although many systems are in use by which flat arches of fire-resisting materials can be employed in combination with iron beams, there is just the possibility of some flaw in the iron skewbacks or tie-rods, which restrain the thrusting action of the arches, that renders the whole system unsafe, so true is it that the strength of a structure depends upon that of its weakest part. Every part of the floor or roof of this description may be perfect in construction, yet from a slight weakness of the thread of a screw or a nut the whole structure may collapse without the slightest warning, burying in its ruins many hapless workmen. A very sad instance of the uncertainty of this kind of construction we reported last week. An addition was being made to a large bakery in Glasgow, where several floors were constructed of arches running from gable to gable, and each set of arches on a floor was restrained by a tie-rod of iron. From some unaccountable cause the tie-rod of the upper floor suddenly gave way, causing the arches to thrust or bulge out the north gable wall. The precipitated arches broke the two floors underneath, one after the other. A number of bricklayers on the same floor laying cement, in their haste to escape at the snapping of the rod, jumped out of a staircase window, one of whom broke his leg. The accident might have cost the whole of the men their lives. This is one of many catastrophes of a similar kind. The fault can hardly be attributed to neglect. Some latent flaw in the iron, or some unequal stress on one rod, may have been the cause. If blame can be attached to anyone in such a case, it is to the workman who screwed up the nut, causing a great tensile stress to be suddenly thrown on the tie, or shearing stress on the nut. The system of floor construction on arches resting on beams, and tied together by tie-rods, is one that, to say the least, is open to risk, as a very slight cause, imperceptible to the builder, such as a flaw, is sufficient to imperil the structure. Not only careful design, but scrupulous workman-

ship and supervision become necessary, as the most trivial oversight may be sufficient to cause failure. The whole series of brick arches of a floor of this kind depends on the iron ties; they are, in fact, like a pack of cards, one shifting the whole collapses. The abutting arches constitute a dangerous system, as a few pounds weight on the floor intensifies a hundredfold the outward thrust, which has to be met by the ties. Better systems of arching and floor construction are now used, such as the Dennett system, the Lindsay, and other plans, by which there is no thrust, but simply downward pressure, not depending on a few nuts and screws. Numerous have been the failures to iron roofs depending on tie-rods, only to be avoided by a system of counterbalancing. We have also heard lately of an accident to a church, the chancel arch of which suddenly collapsed. Such accidents have not been numerous, and are generally the result of removing the centres before the arch and masonry have had time to settle, or sometimes caused by the insufficient abutments or buttressing of the supporting piers. These failures are often due to neglect of simple precautions in the construction, and not to any fault in the design. Attention also has been drawn to unsafe iron railway bridges, many of which structures, erected fifty years ago, are now scarcely equal to the travelling loads they have to bear. Here maintenance of the structures to a standard of efficiency, timely attention to members of the iron structure which deteriorate from rust, protection by paint, and other means, are demanded even in those instances where errors in construction have not been detected, and where there is a considerable margin of safety left after wear and tear.

IRON IN ARCHITECTURE.

AMONGST the changes that are taking place in the art of construction, one of the principal is the substitution of new for old materials. A revolt is being made against those older methods of building which have so long held a high place. We are repeatedly being reminded of the inroads of iron and steel, especially in the construction of buildings of any importance in the cities of the United States, the principal object of which is to give rigidity and strength to structures of great height, and at the same time to diminish the thickness of walls. The same tendency is observed in the erection of large buildings in London, that of making piers or stanchions of some hard and resisting material at all main angles, and filling in with a lighter material. We may call this the "rib or pier system" of wall construction, one eminently scientific, but not one that is favourable to art, as it would rob the architect of one source of effect which he greatly esteems, thickness of walling and, therefore, any display of recession and architectural membering, like deeply-moulded jambs, shafted doorways, and depth of reveal. Half the poetry of architecture, its charm of light and shadow, would be gone by reducing our walls to mere skeleton work, tiled over or covered with slabs of concrete, such as the buildings now being erected for the Great World's Fair at Chicago. It is true we may construct our recesses and jambs, but this would be against Pugin's dictum and all authorities who have protested against "constructed" ornament—very well in its way for exhibitions of buildings as illustrations, as we saw in the "Old London" Street at the Health Exhibition, but utterly repugnant to our sense of real architecture. Yet the idea of constructing scientifically and economically has so far taken possession of architects that they do not scruple to employ modes of construction that are radically dishonest. Take, for instance, the adoption of imitation half-

timber work in which, instead of framed timbers of the whole thickness of the wall, thin pieces are put on the face of the wall, or cement is used to give the semblance of framed work. The timbering of buildings is fast declining. We see porches constructed of cast iron; bay and mullioned windows no longer exhibit the old framed and moulded woodwork, but are constructed of cement or artificial stone. The old wooden barge board has disappeared; the verandahs and conservatories are supplied by the wholesale cast iron founder; even the carving is flimsy and thin, and has all the mechanical vapidity of machine-made work. A general surrendering of old to new materials and hand to machine labour is evident. Such a change is inevitable. We do not expect our modern buildings to be like old ones; if they tried to imitate their age it would be a grievous fault. Nor do we expect to see iron fittings and details like wooden ones, as that would be dishonest. What we wish is that there should be more independence in designing; not so great an attempt to copy old forms of one material in another totally different in its nature; and that cheap ornament done by casting or stamping should be restricted.

One important instance of the introduction of iron in place of timber is that of the iron roof, and this substitution is not only observed in new buildings but in old. Very many of our old churches, though happily only those which have been erected during the past century, have already been reroofed or are undergoing the operation chiefly on account of the decay of the timbers and the considerable spans which they have. The cause of the speedy decay of these roofs when they are compared with the far older, and in fact ancient, Mediæval roofs of churches of the Old Foundation, is to be attributed to their flat pitch and want of ventilation. Most of them have flat or curved ceilings of plaster, and the timbers have been exposed to alternate states of great heat and dryness and moisture. The timbers are generally of Memel or red pine, the trusses are often well constructed; but the main intention has been to conceal them entirely, and to form a flat plaster ceiling panelled or a vault. Sometimes the weight of the ceiling and ribs of plaster has caused a breaking away of the plastering or "key" from the lathwork. We remember an old Classic church, All Saints, Southampton, designed by a pupil of Chambers, which underwent a complete restoration of its roof, chiefly because of the dangerous condition of the segmental vault of plaster. Many of the ribs and coffers which were suspended to the timber trusses had broken away and threatened to fall. The whole plaster ceiling, a fine one of its class, was removed, and one of mahogany resembling the old design was substituted. The timber trusses were skilfully constructed, framed to suit the curvature of the vault, but showed signs of decay in parts owing to the want of air circulation. Sooner or later a new roof will be necessary. Very many of the same class of churches in the Metropolis, of which there are several in South London, as those of St. John, Waterloo-road, St. Mark's, Kennington, St. Matthew's, Brixton, and St. Luke's, West Norwood, and many better known, as St. Martin-in-the-Fields, St. George's, Hanover-square, have their roofs constructed in the way described. Some of these roofs have been restored, and others will demand the same process before very long. The question has arisen whether these timber roofs should be reinstated in timber or in iron. The many advantages of an iron roof and its durability have, naturally enough, been emphasised by the restorationists. When it is not visible, but concealed by plaster, what does it matter whether the trusses are of iron or timber? There is, no doubt, a sentimental objection to a material which has never yet been con-

secrated to the purposes of high art, which has only been used for factories and railway sheds. Surely for ecclesiastical structures it is sadly out of place. The objection is certainly one that ought to be faced. An iron roof over a church! Why, the thing would have been quite intolerable a few years ago, and we confess we do not like it now; but when the iron is invisible and all is ceiled in plaster below, what matters? It is fireproof and durable, and will not want frequent repair. Anyhow, the ice has been broken. We believe iron has been introduced in several roofs of this class of buildings, and we lately reported the fact that the parish church of Brixton, an example of the old pseudo-Classic galleried church of the early part of this century, has recently undergone, or is now undergoing, the restoration of its roof, the old timber trusses being reinstated by wrought-iron trusses of braced type, composed of T and angle irons, which will support the flat, panelled ceiling in one span. Such an innovation would no doubt have shocked the sensibilities of so conscientious an architect as Parden, whose work it was; but in less than seventy years after it has been deemed necessary to make the substitution. The question of reroofing in iron is one that ought to be considered by the architect in its many bearings. For buildings of the class we have mentioned there is little to be said against it, except that it would necessitate repainting occasionally to prevent oxidation, and that it may affect the sound a little. Unfortunately we have no experience of iron in roofs over buildings in which large congregations assemble and music and singing and preaching take place. Over churches it has been almost unknown, and therefore architects have cautiously refrained from using it. How, for example, iron trusses will stand the warm, moist atmosphere of the space between the ceiling and the roof covering; whether they will be subject to speedy oxidation, be troublesome owing to the condensation of moisture on their surfaces; whether the effect of iron will be good or bad for the sound, are questions that have to be decided by actual facts. The corrosion of iron has to be set against decay in timber in unventilated spaces. A report submitted to the Glasgow Corporation by the city engineer has proved the existence of dry-rot in the ceilings of the new Municipal Buildings, which will have to be replaced, and a scheme has been introduced by which a space for ventilation is to be left under each. Where there is any dampness without ventilation the dry-rot has set in. An unventilated timber roof favours this condition. We have no evidence to prove that iron in the same position would not be subject to oxidation. Apart from the physical aspect of the case, we have the artistic question as to the propriety of iron in such a position. We could not for a moment tolerate a visible iron roof over a building in which there was nothing else to harmonise with it, and where the woodwork and stonework were designed on the traditional models. A roof of the kind would be seriously out of place in a Gothic church, for example, whether ancient or modern. It would be a discord. Hidden behind a plaster ceiling in a wide-span building the conditions are changed; no one sees it, and whether the ceiling is supported by iron or wood no one is the wiser. The plea of honest construction cannot be raised, for iron girders and columns are constantly used and encased in the best building. Again, it may be argued that ironwork is already introduced into church interiors in many ways, for screens, grilles, railings, pendent lamps, and many other things. These, it is true, are ornamental, as in the decorative wrought-iron rood screens and side chapel screens, and are for some reasons more desirable than the old wooden ones. They are of a purely decorative kind, and the work of the art metal-worker. The

natural prejudice and aversion to iron is dying out, even in ecclesiastical buildings, and it is well if the architect keeps his mind open. The reconstruction of old buildings leaves often no choice open; iron is economical as a support, and its applicability to such purposes as galleries, columns, and other requirements is often so obvious that one's sympathies for the older architectural materials have to yield, or be set aside.

STABILITY OF WALLS ON SOILS.—IV.

Isolated Pier Foundations for Fenestrated Walls.

THIS method of treating the foundations of fenestrated walls, on the static pier principle, is not a new or untried structural expedient. The precedents are numerous. It is the same principle which has prevailed prominently in the foundations of the piers of bridges, of ancient aqueducts, of arcaded naves of Gothic and other churches, of the storied loggia of palaces, and in many such-like positions which naturally suggest this isolated arrangement. It is a special structural feature in architectural foundations in Chicago, U.S.A., as initiated, about 1870, by Fredk. Baumann, one of the early architects of that city, for general adoption. The writer about twenty years ago adopted this method in his practice: in some districts he found considerable prejudice amongst masons against omitting the footings under voids in the foundations of ordinary dwellings.

In the Metropolis, as well as in our provincial cities, high and prominent buildings which have their upper floors carried upon strong steel trusses, supported by steel or iron columns or stanchions running down and encased in the masonry piers, have isolated or independent foundations. The structural requirements of arcaded lower stories of commercial buildings, and in such other positions where the maximum area of window-light is required in the lower stories, naturally suggest and necessarily develop this method; and so, likewise, do shop-fronts which are overrun by bressummers carrying upper stories, and all supported upon piers or abutments, which are usually engaged to cross or division walls, with or without intermediate columns under the bressummers, suggest the same independent pier principle, though in the case of the vertical supports having an engaged connection with the cross-walls, the static independence of the pier is destroyed. In such cases, when the foundation is built on a compressible soil with a high-unit load, an injurious difference of settlement might be caused if a careful adjustment of the extent of bearing surfaces be not effected, which is difficult to do, as it involves the perimeter element of frictional support treated of in the preceding number (III.). Some cases of ruptured lintels, alluded to previously, may arise from this cause, as well as from continuous foundations. The bay wall-space or panel between such piers, and sometimes called "curtain walls," are then afterwards built in when the building is roofed. It may consist of the lighter descriptions of walling when built in an area, and containing window and door openings.

In Chicago, the steel rail and I-beam grid-footings, which are embedded in concrete, that have been adopted with the view of rapidly spreading the footing base sufficiently within the least height, and thus avoid their usual incumbrance of valuable basement floorage, are designed upon the uniform system of the isolated method of pier foundations. This economy of basement floor-space is particularly valuable in Chicago, by reason of the shallowness of the "hard pan" clay bed, which floats on a soft bed of mud over 70ft. deep. The "hard pan" there affords the sustaining foundation soil, and its surface is of limited depth below the street level.

Static Piers Ignored in Ordinary Buildings.—In the ordinary run of houses built all over the country the static anatomy of fenestrated walls resolving their foundations into isolated pier supports is never adopted, even if the designer recognise the action of the static principle involved. This persistence, no doubt, arises perhaps more from the deep root of the opposite custom which has hitherto prevailed, than from absence of intelligent recognition of the scientific basis of the isolated method, and often because that, in ordinary houses, there is a vague idea there cannot be sufficient difference of settlement to cause a sensible effect; but the facts which are

patent to the observer by their results are often otherwise. But when there is a consciousness of probability of unequal settlement, hoop-iron bond is adopted as a save-all expedient. But why create the necessity for hoop-iron bond at all, when, by the use of ordinary skill in the omission of footings under voids, its use becomes unnecessary and superfluous? The injurious effects of violation of the requirements of static piers is often very incipient, unexpected, and surprising. A remarkable case of this kind is related by Mr. Baumann. It occurred in the east gable of the old "Crosby Opera House," destroyed by the great Chicago fire of 1871. In it were only two small windows (one over the other in the centre of the wall), the voids of which only omitted twenty tons of brickwork, and they were placed so high up that ordinarily there would be no suspicion of their producing fissures—the lower one was 32ft. above the level of the foundation, and the upper one was about 22ft. higher up. The wall was 92ft. high and 92ft. long. The footings were 5ft. longer—in all 97ft. on footing-plane, and weighed 850 tons. The basement wall was built in solid rubble,

laid in cement upon the "hard pan" clay; the wall above was 20in. thick of brickwork for 20ft. high, the upper portion being 16in. thick. So that here were voids of 20 tons producing unequal settlement in a wall of 850 tons and 97ft. long on the level of the footings, producing a pressure of 26lb. per square inch on the foundations—i.e., 1.67 tons per square foot only, resulting in serious fissures in the line of the voids, breaking through the tenacity of brick walling of 70ft. high, and 20in. to 16in. thick, besides that of the heavy rubble basement wall 12ft. high laid in cement. Similar effects have been noted in heavy internal masonry walls having only a few door passages through them. But in all such cases, if the foundation underneath the voids be omitted, no such unequal settlements would occur, and then hoop-iron bond may safely be omitted.

Pilasters, Buttresses, or Engaged Columns.—When these are features of a façade the outline of the foundation naturally partakes of the shape of the outline of the section on the plane of these features; hence the usual design of the footing merely follows the configuration on the horizontal plane, instead of the design being dictated by the static requirements of the voids between the vertical features, whereby there is an adjustment of the position of the axis of loads to coincide with the centre of the supporting base, at the same time the intensity of the load must be equalised to the safe-bearing power of the

soil. But this merely following the horizontal outline of the features in connection with the wall is only a compromise, and does not completely satisfy the static requirements of the case. Hence, when the soil is perceptibly compressive, there is the ever-present tendency to unequal settlement under unequal distribution of loads as above occasioned with the consequent rupturing of the walls, &c. The further development of such unequal settlements only depends upon the superiority of the disruptive forces over the horizontal tenacity of the masonry, which is frequently supplemented by hoop-iron bond. It is, however, better to avoid the blunder of blindly creating these destructive forces by omitting the portion of the footings underneath voids, as in the examples in Fig. 12, between the lines *aa* in example A, between the lines *aa* in example B, and between the lines *aa* in example C, and thus dispense with hoop-iron bond and save about £1 a rod in the brickwork. The distorting strains in various directions which are produced by foundations under voids frequently reach up to the roof, and these cause deformations so that the gutters and other parts of the roof leak more or less. When once these displacements begin, their recurrences and continuations are always inevitable, though uncertain.

Normal Transverse Directions of Wall Failures.

—There are but four normal directions in the horizontal plane in which all wall or pier structures will yield to overturning or transverse force tending to deflection—that is, two in opposite direction in the line of its length, which may be distinguished as *plus* and *minus*, and two acting in opposite "senses" transversely of it, and similarly distinguished. All other directions oblique to these must partake partly of each of the adjacent normal directions, and can be referred to definite quantities of each of them respectively. Thus, suppose Fig. 13 to represent a plan and elevation of a pier acted on by forces in the directions of the arrows. First, if the force act towards E, it displaced the top of the pillar to *b*, as shown by the dotted square *bE*, or if a force acted separately towards N it would displace it to the dotted square *aN*. But if both forces acted together or consecutively, it would be displaced to NE in the position of square *ab*.

Disruptive Forces (direction of their action).

—The directions in which disruptive forces act are indicated by considering the principle upon which the results are manifested as depending upon the fact that structures yield at their weakest points and in the weakest lines of direction. Under this guiding principle it is not difficult, in most cases to analyse the direction of action and reaction of the forces involved in any case. The forces at work, their origin and initial position, must first be discovered. Thus, suppose the piers on each side of a vertical tier of windows to settle unequally, from whatever cause, because there may be more than one cause in operation, and there may be also indirect, as well as direct, causes which will be considered in their place. This unequal settlement is shown in Fig. 14, by the scale arrows at foot of piers A, B, C, and D, by which letters also the entire piers will be distinguished. Accordingly, A and D piers are shown to have settled 3 units, which may be an inch or any fraction of an inch, and B and C to have settled only one such unit, making a difference of 2 units, of unequal settlement. The distribution of the fissures which would follow this inequality of depression would pass through the weakest part of the wall structure, the spandrels and masonry transoms, and would usually partake somewhat of the direction of the zigzag lines A to C, A to B, &c., whereby the lower part of the wall transom, in the form of an inverted bracket attached to piers A and D, would drop, as shown by the scale-arrows A D. The piers A D, to which the inverted brackets are attached, have settled two times more than the adjacent piers. The line of rupture shown along the sinuosities of the mortar-joints is usually the weakest, but not the most direct, course. The latter would take effect in a vertical shearing action down through the masonry transom. If the window-sills above these spandrels be strong, their depression at the A and D ends may tend to crack the upper brickwork brackets attached to B and C in a more or less vertical line between the reveals of piers D and C. The sill may also, by its leverage at the C-pier end, tend to crack away the thin reveal of the opening W. Frequently the sill is cracked near its centre before thus displacing the reveal. If the pier D

to the right of B had settled, say, 3 units, then the pier B in the centre between A and D, which had only settled one unit, would thereby be dragged down by the resistance of the spandrels of the several stories before rupturing. The pier B being thereby abnormally and usually eccentrically loaded, would thus likely be bowed outwards, showing opening joints near the centre of the height of each window void, or it might be otherwise displaced in the direction in which its resistance was weakest.

Further considering only these three unequal settlements as represented by the main and secondary concave curves *d, e, f*, with the alternate convex curves *g, h, i*, which may be assumed as roughly indicating in exaggerated elevation the bottom plane of the footing base, being highest at *g, h, i, j*, and lowest at *d* and *f*, the secondary depression being at *e*. This disposition of the footing naturally gives rise to abnormal stresses, causing more or less tendency of the substance of the wall to radiate vertically or be expanded unequally or fanlike in the direction of the lines and arrows *r* and *r'*, round the centre of the convex curves *r* and *r'*, and thereby cause a strain upon the horizontal tenacity of the masonry, increasing upwards with the extent of the leverage above the centre of action. The spandrels or transoms being the weakest parts of the wall, their yielding by fissures or opening of joints might cause the sills to draw out at either end. If the window voids were arched, the arches would be more or less shattered. In like manner regarding the pier A or D which have settled lowest, the effect on the pier itself of the concaving of the foundation plane would be radial compression or contraction towards the centre of the curves *f* or *d*, but with a more contracted range than that of the radial lines *r* and *r'*. These two radiating forces would coalesce with the two corresponding radiating forces generated by the curves *j* and *g*, and neutralise each other at some intermediate point, as, for instance, in a vertical passing through the centres of the piers A and D.

(To be continued.)

DECORATIVE LIGHTING AND IRON-WORK.

IT has been left for the art-metal worker to bring the electric light into harmony with our architectural and internal fittings; to support or suspend the light in a variety of artistic forms; to soften or diffuse the intensity of its brilliance;—in a word, to clothe and embody the light in a form at once appropriate and beautiful. The electrical fitting is no longer a crude piece of mechanism, such as the inventor and engineer first gave us: the artist and craftsman have been enlisted to adapt it to various conditions and wants, and iron and brass hammered from the forge, black or polished, plainly wrought or jewelled, have been applied in a marvellous variety of forms which, in their beauty and fineness of workmanship, vie with, if they do not excel, the work of the smith's art of Italy and Germany. We no longer are content with stereotyped cast metalwork in the shape of electroliers, brackets, standards, and fire-grates; but we desire something original, to introduce variety into these fittings. One West-end firm, Messrs. Rashleigh, Phipps, and Dawson, of 53, Berners-street, W., have devoted themselves specially to show how the electric light can be introduced in an artistic manner, and with that view the firm have gone to considerable expense in the production of art metal-work of a high character. We lately drew the attention of our readers to the central mosque and fitted rooms shown by this firm at the recent Electrical Exhibition at the Crystal Palace, where some very ornamental and effectual lighting appliances and wrought metal-work were to be seen, quite superior to anything in this direction that had been done before. A more recent visit to the showrooms of the firm has given us the opportunity of calling our readers' attention to certain improvements and artistic developments of the art, and to give a few sketches of the class of fittings and wrought-iron ornamentation introduced. The designs have been prepared by the artist of the firm, Mr. W. Amor Penn, who was awarded several first prizes at the recent Armourers' and Braziers' Exhibition for hammered work in the Applied Ornament section. These designs are distinguished by a certain freshness of treatment not always found in art metal-work, as we notice in the fire-grate and

dogs and railing. We have had too long a surfeit of replicas, and one reason why architects have not encouraged art metal-work more is that there is the mischief of seeing one's design repeated in the stock patterns made in the trade. Messrs. Rashleigh, Phipps and Dawson, have scrupulously avoided this mistake in their large collection of objects which have been manufactured at their own works in Stanhope-street, Euston-road.

In the design of fittings adapted to the purpose of the electric light many things are to be kept in view. The object has been to adapt brackets, electroliers, standards to this new illuminant; to give to these forms of support for the incandescent light a particular treatment distinguished from that which has been in use for gas. More elegant and graceful forms—many of them representing natural and organic objects—suggest themselves to the designer, as those of the sun, planets, flowers and fruit, the imitation of which, within artistic limits, has been taken advantage of, as in the very beautiful glow-lamps introduced by this firm. The bracket sign or lamp illustrated by the sketch on the upper left-hand corner of our double-page of illustrations is an example of Flemish treatment in wrought-iron well suited for exterior lighting. A ground-glass globe with rays of light in polished metal may contain the light, and represents the sun. For lighting building exteriors of various kinds this wrought-iron bracket may be both useful and ornamental. What can be more appropriate than a forged iron bracket supporting a lantern or carrying one suspended, three or four examples of which we give? Many other very elegant adaptations of the forged or polished iron bracket have been made: some of these support spheres of ivory with pendent lanterns, as those in the "Solar" room at the Crystal Palace, representing the solar system or the central sun and the planets round it; others are glow-lamps imitating flowers with petals. In these designs the artist has had to adapt not only his bracket support, but also to introduce a form of receptacle to his light appropriate to its nature. Many suspending lamps from brackets are to be noticed in Berners-street, some of them exceedingly elegant, as in the hall lantern of Flemish design in polished brass, and in the triplesuspended lamps we illustrate over the sketch of staircase handrail. This description of lamp offers itself admirably in the lighting of interiors. The brackets can be made to spring out of the surbase mouldings or stringcourse above a dado, or be introduced into panels or medallions in the wall, and from these brackets wall-lanterns depend. For drawing-rooms and galleries nothing is more appropriate or ornamental than this mode of holding the lamps, as the shadows are reduced to a minimum, and the panels or pictures between the brackets or sconces are well lighted. We see examples of all forms of sconces, girandoles, and brackets in black polished and gilt iron, all shaped by the smith's hammer, full of character and quaintness, and allegorical or symbolic in *motif*, contrasting greatly with that coarse kind of brasswork one sees, in which bent tubes and polished balls are decorated by flat stamped-out scrollwork. Architectural considerations have not always been consulted in the fittings of this kind; but in the lantern designed for an alcove (see sketch at top of sheet), and fixed by this firm in the Lyric Club, Coventry-street, we have a sensible treatment.

Standards and electroliers are other forms of utilising and supporting the electric light, the one from the floor, the other from the ceiling, and in these modes the manufacturers have often gone wrong, not duly realising the conditions of each. Art metalwork could not possibly be applied to a more decorative purpose. The ideas of support and suspension must be kept in mind in the design of standards and electroliers: the rigidity required in the lines and curves of the one is not tolerable in the other. We have given an example of each in the sketches. An electrolier of polished brass, in which organic forms are introduced founded on plant growth, with Venetian glass opalescent shades representing flowers, is an artistic production that no stickler for propriety can question. We illustrate a bronze figure for a hall staircase which Messrs. Rashleigh, Phipps, and Dawson commissioned Signor Marolda to model for them, and which they manufactured expressly for the late Electrical Exhibition. The figure represents the new light holding down by

her side the old in the shape of an inverted torch. She stands on a globe signifying the earth, and on it is the inscription, "Electricity Dominates the World." The child at the foot holds his hand before his eyes against the bright light. Amongst other symbolical designs is a mermaid, cast in the ancient *cire perdue* process used by Cellini; and a water-spray fountain, with triton and dolphins, and exhibited in last year's Royal Academy, is well adapted for this light.

A visit to the showrooms in Berners-street will give a good idea of the possibilities of the light of the future, and how it may be applied in a thousand different ways. Incandescent lights of every conceivable form are noticed, perhaps the most quaint and pretty being the patent cone light invented by Mr. Jordan of Brighton, consisting of a series of reflector petals or leaves, to represent a flower, in the centre of which a lamp is placed, the light being transmitted through coloured glass. Nothing can be more unique than this glow-lamp arrangement of polished metal in the shape of copper, brass, or silver disposed as petals, and several designs are to be seen in action suitable for boudoirs, and which this firm is applying for domestic and for advertising purposes. One is being fixed at the new Empire Theatre, Brighton. The introduction of jewels or beads of Bohemian glass for diffusing the light is another new departure, and many very striking and brilliant effects are produced by means worthy the attention of the decorative artist. Very wonderfully finished are several of the lanterns, and the finely wrought-iron and brass brackets beaten out by hand in some instances from sheet metal. Almost fairy-like in effect are the glass jewels and fringed shades of beads in delicate hues, and the lights shaded by silk and other fabrics, one standard stamp with a shade of this kind being illustrated on our sheet. In conjunction with the arts of the metal-worker, the combination of metal, the use of coloured glass in the form of fringes and beads, the imitation of flowers and allegorical figures, the electric light promises to become a valuable aid to interior decoration.

LAND SURVEYING AND LEVELLING, AND THE TESTING, ADJUSTMENT, AND USE OF MATHEMATICAL INSTRUMENTS.

By G. W. COBHAM, P.A.S.I.,

("Crawter" and "Special" Prizeman of the Surveyors' Institution.)

(Continued from page 101.)

THE OPTICAL SQUARE.

THIS is an instrument used, like the cross staff, to set out right angles; but it has the advantage over the cross staff that it can be

Fig. 39.

what is seen when the eye is placed at the sight hole. Fig. 39 shows the principle on which it is constructed.

The outer case is in two parts, one within the other, one being fixed to the top, the other to the bottom; they revolve on one another for a short distance, so as to close all the holes when not in use.

The eye is placed at the hole A, and the staff X sighted direct, through the hole B at the upper part of the instrument. The staff Y is seen through E below, after reflection from the mirrors D and C; the rays of light passing from E to D, D to C, and from C to the eye at A. When the two staves appear above one another, as if part of the same staff (if the instrument is in adjustment) the directions from the centre of the instrument to the staves form a right-angle. If it is required to sight a staff to the right of the base line, the instrument is turned over, when DE will go to the right; Y will then appear above X. Some instruments have another pair of

staff X can be seen over it. As, however, an edge would interfere with the sight at the point where the two images come together, C is usually the full height in glass, but the silvering only extends half-way up. The dotted lines show the planes of the mirrors; the full lines show the courses of the rays of light, the arrow-heads on them showing the direction from the eye to the staves.

It is a fact, demonstrated by experiment, that when a ray of light is reflected by a mirror the path of the ray after reflection makes the same angle with the normal from the mirror as the ray did before reflection, but on the opposite side. As the normal from a plane is at right angles to it, and all right angles are equal, it follows that, when using plane mirrors, any ray after reflection makes an equal angle with the mirror to the angle it made before reflection; that is—

$$VCS = DCO (\alpha), \text{ and } ODC = PDS (\beta).$$

$$PDS = DSO + DOS \text{ (I. 32)}$$

But—

$$PDS = ODC (\alpha); DSO = VSC; DOS = DCO$$

$$\therefore ODC = VSC + DCO \dots\dots\dots (\gamma)$$

$$VCS + VSC + SVC = DCO + DCO + ODC \text{ (I. 32)}$$

But—

$$DCO = VCS (\alpha); ODC = VSC + DCO (\gamma)$$

Therefore the equation becomes—

$$VCS + VSC + SVC = VCS + VSC + DCO + DCO$$

Taking VCS + VSC away from both sides—

$$SVC = 2DCO.$$

This gives the general rule upon which the construction of the quadrant and allied instruments depend. When a ray of light is successively reflected by two mirrors, the deviation of the ray is twice the angle of the inclination of the mirrors to one another.

Of course, in the optical square D O C is made 45° ; therefore $SVC = 90^\circ$, or a right angle. The angle of the two rays depends only on the inclination of the two mirrors, and does not depend at all on the inclination of the ray to the mirror, so that if this changes the angle is unaffected. When the instrument is held in the hand, the inclination of the ray to the mirror is continually varying; but, provided the motion is not sufficient to throw the object off the mirror, this does not vitiate the result. Obviously, this property is of great use—in fact, indispensable—for any instrument to be used at sea.

(To be continued.)

THE ARCHITECTURAL ASSOCIATION EXCURSION.—III.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

BRIDGWATER CHURCH was seen as the first object of interest on Wednesday. The tower was restored by the late J. D. Sedding, who erected a stone screen at the west end of the church, which is a spacious and handsome one remarkable for its tall thin spire. *Cannington Priory*, where they incorrectly say "Fair Rosamond" was educated, includes the remains of a Benedictine nunnery, founded by Robert de Courcy in 1138; an account of the institution is contained in Mr. Hugo's "Mediaeval Nunneries of the County of Somerset." In 1602 the manor was granted to Thomas Lord Clifford, in whose

family the estates still remain, and the premises, after having served as a Roman Catholic nunnery till a few years ago, are now occupied as an industrial school for boys brought up in the same faith. The buildings cannot be said to merit much praise, for the Debased Tudor style in which they were erected has little to commend it. The Classic chapel to the school is poor in the extreme. The short, lofty church is covered by a single roof over nave and aisles, which has a good spacious effect seen from the high altar pace. The domestic chapel in Gurney-street Farm near the church is *in situ*, but is used as a china closet. The excursionists were not allowed to visit this building. The tower of the church is massive and heavy, grouping best from the east end. In the building are some screens, and an old oak chest is in the vestry.

Blackmoor Farm was next visited, and we give a view of the building among our illustrations to-day. It is chiefly interesting for the chapel, which still exists, though desecrated. Inside there are two wall-niches on either side of the window, and these are of capital design with delicate detail. The beam over the sanctuary shows the mortices where the uprights of the screen once stood, but placed further west of the chapel than at present. From the rear over the mill weir the house makes a pretty subject, but architecturally the view herewith depicted is the best. Remounting the drags after some sketching had been done under a tropical sun, the Associationists soon reached

Spaxton Church, which lies "where zun and zoil aid the farmer's toil," in the lowlands beyond the furthest spur of the Quantocks, and contains some curious bench-ends and an alms chest, besides a beautiful 14th-century churchyard canopied cross. The altar tomb of the De la Hilles, in the chancel opening into the vestry, should be mentioned. The full-length effigies of the knight and his lady are in remarkable preservation. So complete are the figures as to lead to the question as to their authenticity; and at any rate, the surface of the stonework has been re-worked, and no part is broken save in the canopy over the monument. In the sacristy is a very rich Old English carved chest. The pewing is very varied in the carvings to the ends, some being especially interesting and good in design, such as the "Fuller's pew" standard, but others are coarse and poor. The church, built of very large stones, is not a very refined example of our national architecture, but as seen from the east end the tower and gabled aisle pile up well with the nave and chancel in massive grouping, though the detail lacks refinement. The courthouse adjoining the churchyard is of Tudor date, with most of the ancient windows remaining; but there is nothing worth specially naming respecting it. The farmer makes rare cider on the premises, and entertained his visitors with more than a sample. Thus ended the work of Wednesday.

Taking train on Thursday by eight o'clock, an early start was made to Williton, where the party set off by carriages to *East Quantoxhead*, and amidst the pouring torrents of rain two hours and a half were spent most profitably. Mr. John L. Robinson, R.H.A., before the wet came on, took a group of all present before the entry to the mansion. *East Quantoxhead* is the nearest village to the sea, "where deep below the yellow tide lashes the pebbly shore, and in winter roars with a bleak and chilling blast from over the narrow channel." The plain, solid-looking Elizabethan manor-house, embodying the remnant of a bigger mansion of 15th-century date, stands close to the shore by the side of the simple old Parish Church, which is of special interest inside, but having few external pretensions. There are inside some very good bench ends, and a capital pulpit (see panel herewith illustrated), and on the north of the chancel stands a fine stone altar tomb of 16th-century date, under a beautiful canopy, in memory of Hugh Luttrell. The house called "Bell Castle" contains some famous plaster chimney-pieces of bold and somewhat rococo design, elaborated with figures illustrating Scriptural subjects chiefly, piously conceived no doubt, but very crude in design. The coloured hearth tiles in blues, greens, and brown are very good, and uncommon. The mullioned windows of the house are exceedingly simple, and on the old part is a good battlement, with quatrefoil panels. The principal staircase is a suggestive Jacobean example of the plainer sort, as will be seen by the accompanying detail from the pocket-book

Fig. 37.

mirrors so that a staff can be sighted in each direction at once. It can then also be used as a line ranger, as when the two staves are made to coincide, the centre of the instrument is on the line which joins them. The square is adjusted as follows: An object is set up at right-angles to the line joining two others, as shown in Fig. 35. The square is then held at B, and if A and D coincide, it is in adjustment; if they do not coincide, they must be made to do so by turning the screw at M. The mirror D is pivoted at H and tapped at K. The screw works in the hole K, and a shoulder butts against the block L,

Fig. 38.

which is fastened to the bottom of the instrument. K and L are kept apart by a spiral spring round the screw. They are held together by the screw, and any movement of it causes the mirror D to revolve round H until it is in the right position.

The general principle of the instrument is shown in Fig. 39. This figure also shows the principle of the sextant. The mirror C only extends half-way up the instrument, so that the

of Mr. J. A. Gotch, F.S.A., whose sketch plan of the house, with marginal notes, serves to show the arrangement of this rambling old dwelling. It belongs to Captain Luttrell, who put the house in good repair a few years ago. The manor has been held by the Luttrells in direct line from the Conquest, when it was granted to Ralph Paganel, and is now well cared for. The owner met the excursionists, and explained the place. In the church we noted a charming east window by Mr. Kempe, in white glass, with the crucifix and SS. Mary and John in bright and artistic colours.

The quartermaster, Mr. Charles Wellard, notwithstanding the downpour, sounded "marching orders" for the return ride over the hills, the next item on the programme being lunch at *Williton*, which lies to the landward side of the hill, where stands St. Decuman's in a shallow valley, backed by a landscape of cultivated high grounds and vales. It is a small, straggling village with two sheltered streets of cottage homes embowered in scarlet creepers and jessamine. Two old mutilated crosses stand hard by the doors of the Egremont Inn and the church, once the chantry chapel, erected by Robert Fitz-Urse, brother of Reginald, who had a hand in the murder of St. Thomas à Becket, the "pestilent priest," whose assassins were well represented in this part of Somersetshire. Reginald Fitz-Urse lived at Williton in the reign of Henry II., and Sarnford Brett Church contains the recumbent effigy of another of Becket's murderers—Richard le Bret, sometimes called le Brito.

Leaving the hospitable "Egremont Arms," the "trippers" set off at full trot, and by this time the rain had cleared off fairly well. Half an hour's drive brought them through the park to *Nettlecombe Court*, once the home of the Raleighs, and now the beautiful estate of the Trevellys. The mansion, of Tudor date, was once surrounded by formal gardens, a veritable ancestral home rich in heirlooms, such as the curious miniature portrait of Charles I. worked with his own hair. The manor house adjoins the churchyard, almost touching the western tower. It has been much modernised in Georgian times, but has a good hall and staircase, with nice plaster-work and a few pieces of furniture. The church is very uninteresting. *Combe Sydenham*, with its gabled tower, stands close to the road, and is dated 1580. It is said to be haunted with the ghost of a Royalist soldier, Sir George Sydenham, who died in 1595, leaving a chequered memory, like his king. At large he rides down the Coombe till cockcrow, and seldom, if ever, visits the hall nowadays. The Drake cannon ball legend is associated with the place in connection with Elizabeth Sydenham, who married Sir Francis after all, though if the story may be credited, she was about to be married to another when the meteorite came down in a storm and stopped the ceremony. In the drawing-room are some tapestry and other curiosities; but the owner would not admit the excursionists. They sketched outside. The church at the village hard by is a large Perpendicular building, with a somewhat earlier tower of poor character. The arcade separating the chancel and nave from the north or Halsway aisle consists of five large arches and two smaller ones, the columns of which are both pierced elegantly with double hagioscopes in a very unusual way. Cardinal Beaufort, who lived at Halsway, built this aisle. Sir George Sydenham and his two wives rest recumbent between the Nottley aisle on the south side and the chancel, under a canopy, peaceful enough in spite of the ghost tale. Chapels existed in both aisles, and every bench throughout the church is carved more or less admirably and richly. Outside, the church looks very rich, owing to the sculptured battlements and gargoyles. *Halsway Manor*, in Stogumber parish, is chiefly of Henry II. time, with a nearly perfect front of low proportions. A bay window and three doorways give it interest, surmounted with a battlemented parapet enriched with panels and pinnacles, a bell-cot, and gargoyles. At Stogumber the train back to Taunton was met, and soon the comfortable London Hotel was reached for a seven o'clock dinner. During the evening the town was brilliantly illuminated, and the cyclists' procession of crafts and local institutions perambulated the streets, accompanied by bands and torchlights, lanterns, &c., giving a quaint gala sight long to be remembered.

Friday was a lovely day, and the country seemed more charming than ever, high away over the hills, through the woods, and so over after

leaving Kingston, by way of the Beacon, approaching 1,000ft. above the sea, to Cotelstone, deep in the valley at the foot of "Will's Neck," the southern point of the Quantocks. *Kingston St. Mary*, the first place seen, has a well-designed and graceful western tower, very similar to some others in the district, particularly Staple Fitzpaine, St. Peter and St. James's Church, Taunton. The structure is covered with scaffolding, undergoing a process seemingly of repointing. The flatly-groined ceiling of the handsome south porch is worthy of imitation, and the wonderfully varied and beautifully detailed oak-beach pewing in the church furnishes a perfect encyclopædia of Gothic ornament of the later types with Flamboyant fancy. The church itself is not so interesting; but in the nave hangs an excellent and large brass candelabra of three tiers of lights. Before starting for the long walk up the hill already referred to, the party tasted the black cider for which Kingston is celebrated; but the general opinion was not in its favour.

The Stawels of *Cotelstone* obtained their estates at the time of the Conquest. Sir John Stawel, an ardent supporter of King Charles, fought Blake, and bid fair to become one of the most powerful foes of the Roundheads in West Somerset; but the Parliamentary leader was too strongly reinforced with rebels, and, marching to Bishops Lydeard, he routed Stawel, stormed his house at Cotelstone, ruined the manor, and appropriated the lands, throwing Sir John into Newgate, where he lodged for thirteen years under a fine of £25,000. The Restoration brought Stawel back to Somerset; but the house lay waste till it was converted into an ivy-clad farm. In Jacobean architecture it takes a somewhat unusual place, on account of the baluster-like treatment of the mullions to the windows, the same form being given to the wall-piers or buttresses. In 1855 Mr. Esdaile, grandfather of the present owner, restored the building with the idea of renovating the house, so that it now fairly represents the mansion as bombarded by Blake, several of the original parts remaining. The house is used as a farm, though it looks like a private "residence of quality." The outer gateway piers and inner gatehouse, corresponding with the manor house, were but little injured by the Roundheads' arms, though the outer gate formerly spanned the road, and has been entirely rebuilt in its present position. Judge Jeffreys hanged two of Monmouth's adherents on the archway out of spite to Lord Stawel, who objected to the horrors of the Bloody Assize, although he supported the Royal party. The church, the mansion, the keeper's house of stone like the house, and the timber cottages thatched with straw make a group of rare picturesqueness beneath the wooded slopes of the Quantocks. The church is more mixed than others in the district, with Transitional, Norman, and Decorated work in evidence. The Stawel tombs and the font, the carved pulpit, bench-ends and reading desk all combine in making the little building locally interesting; but the church has really been too over-restored to be of any special value to architects, save as a pleasing feature in the landscape, with its square red sandstone tower and lofty spirelet over the stair turret on the north face. We give a view from the garden of the main front of the house, and the tower of the church shows just over the ridge. The interior has been so entirely modernised as to hardly occupy the visitor's time with profit, and the gatehouse as re-erected is scarcely more than a piece of grotto work, and would make a capital background for the next A.A. Soirée extravaganza. *Bishops Lydeard church*,* of which we gave a photographic view, was the last place seen on Friday. We have mentioned it before as possessing an exceptionally fine tower, built in the days of Henry VIII. This is of four stages, each of which is lighted by delicately-traceried windows, and the battlements are so small in their detail, that iron cramps and bars holding the work together form a complete network, and rather spoil the contour. The screen is really a magnificent one, but it is so highly elaborated in colour and gold as to give it a tawdry appearance. The animal carvings and quaint conceits carved on the seats in the church are also very rich and varied, and the churchyard cross of 14th-century date is the finest in these parts, being fairly

perfect, and enriched with a niche and statue, as well as by bas-reliefs round the plinth. The church itself is large and well kept, but the decorations of the chancel seem to be in poor taste, like the coloured glass in the windows. The detail of the exterior is somewhat coarse, but the building is unquestionably handsome. A drive of five miles brought the excursionists back to Taunton for the final dinner soon after six o'clock. After the festivities of the evening had somewhat advanced, and the usual toasts had been proposed, an informal meeting was held for discussing next year's headquarters and the election of the committee. South Norfolk and North Suffolk, including the places not visited during the Norwich and Bury St. Edmund's excursions, will probably be chosen, but details necessarily remain with the committee.

On Saturday the excursionists devoted their time left in Taunton to visiting the grand church of St. Mary's, of which we herewith print a view, and they saw the equally interesting church of St. James and the Castle, now converted into an extremely valuable local museum, and possessed of the wonderful Pigott Collection of original drawings in Indian ink washes by the two Bucklers (1827-47) of Somersetshire houses, churches, and abbatial buildings, in six volumes. A selection of these views should be reproduced and published, for many of the sketches are exceedingly good, and evidently were made on the spot. There is not much old building remaining in Taunton of value to the architectural student other than these already named. The brick-built almshouses over against the main street look like a bit of old Oxford, but the chimneys are made too much of—in fact the buildings look all chimney. The red-brick Market-houses, erected in 1772, alongside the square Town-hall on the parade, are bald in the extreme, but they are not vulgar and pompous, like most market buildings which are built nowadays from designs selected in competition, which, as a matter of course, must look "attractive" to catch the eye, and "cheap," to stand a chance of being carried out. The timbered gables at the back of the Town-hall deserve a passing mention, and so does the Church of St. John in Park-street, a florid building with a handsome tower and spire conceived on French models. It is attributed to Sir Geo. Gilbert Scott, but looks hardly like his work. Street, in his early days, might have done it. So ends the third A.A. excursion in Somersetshire.

PUBLIC BATHS AND WASH-HOUSES.—II.

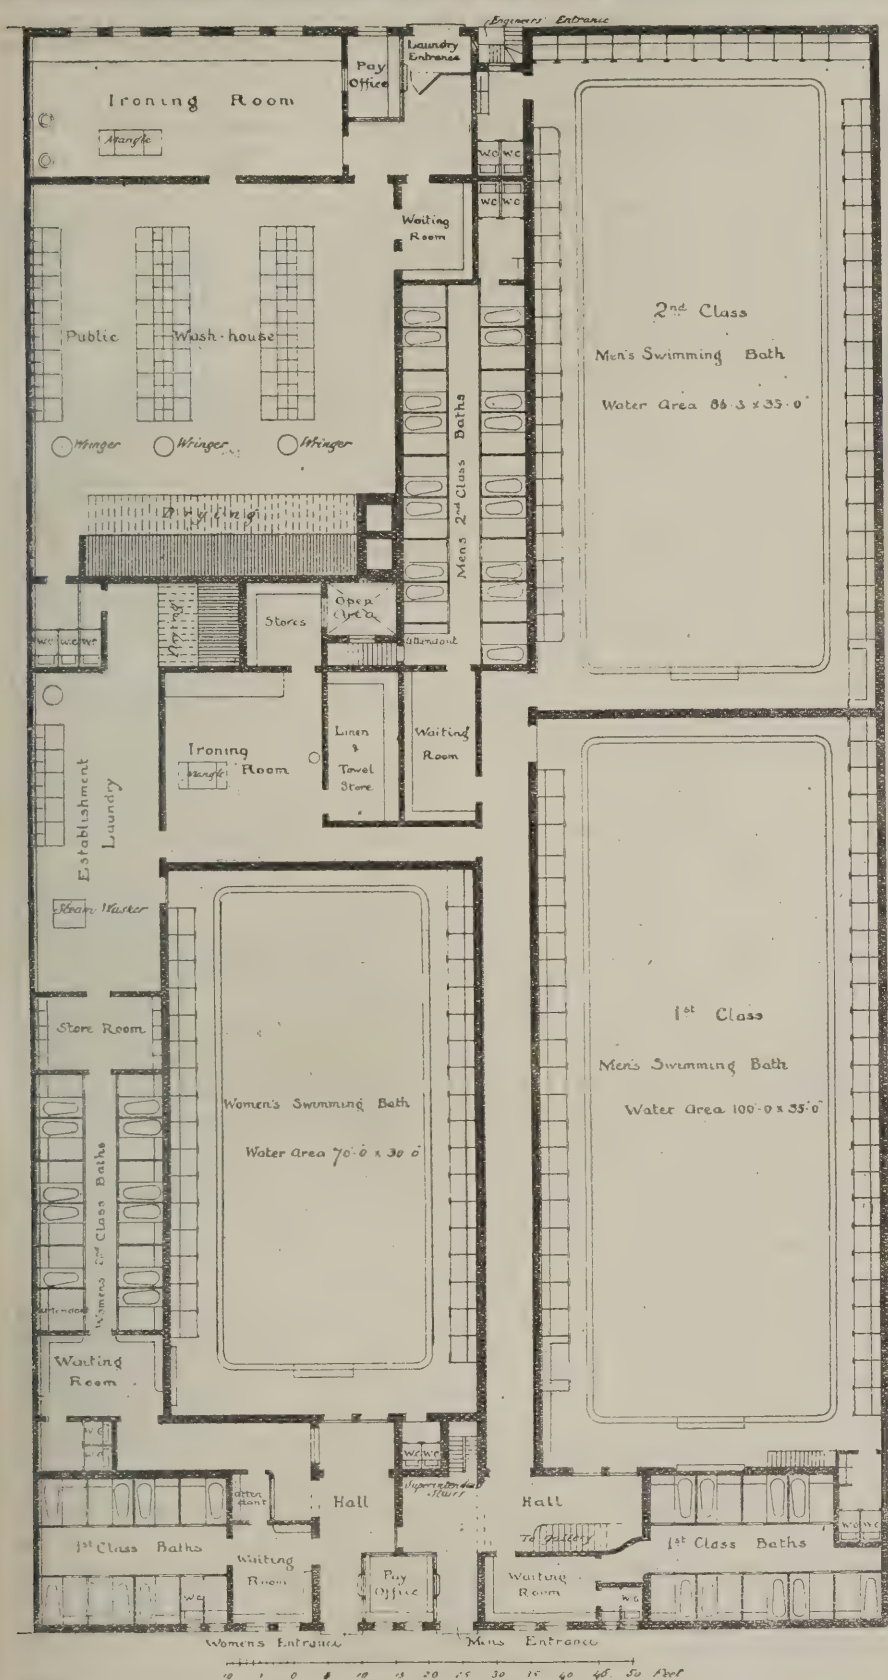

By R. OWEN ALLSOP, Architect.

Author of "The Turkish Bath," and "The Hydro-pathic Establishment and its Baths."

THE position of the site, and nature of the immediate neighbourhood, has, or should have, much to do with the scope and style of the public baths establishment. It is evident that a bath-house suited to a district wholly inhabited by a poor class of residents will not prove what is wanted in a place where are a number of comparatively well-to-do people. Baths Commissioners should more thoroughly study this question of site and surroundings. A grand swimming-bath, for example, is not required among a poor community. For such a neighbourhood a large area of the site may safely be devoted to the wash-house, it being found that, with many poor persons in the locality, the public laundry is always well patronised. In a wealthier neighbourhood the wash-house is but little used. The first-class swimming-bath, on the other hand, will be freely used; and as the price authorised to be charged warrants some little expenditure on the comfort and appearance of the bath, it may be built with some pretension to architectural effect.

In the general scheming of the plan of a public bath-house the swimming-baths will be found to be the chief governing factor. Being, in these days, of such extensive size, their position decided upon, a key is formed to the remainder of the plan, which, broadly speaking, consists of the various corridors and blocks of slipper-baths, together with the offices, waiting-rooms, and other necessary features. Having determined in which position, with regard to the site, the axes of the swimming-bath will best be placed, it must be ascertained that such an arrangement will conduce to convenient methods of approach and an economical and suitable

* An elevation of this tower appeared in our issue for Feb. 20, 1895.

placing of the entrance halls, pay-offices, waiting rooms, &c. The latter may be of no great moment, but every importance should be attached to the methods of approach and the position of the pay-offices. The first aim should be to concentrate as much as possible, to bring as many bathers as may properly be brought in at the same entrance door, so that there may be a minimum of attendance required in the way of ticket-giving.

Two principles may be followed in this matter. Firstly, the classes may be grouped, and the men and women bathers enter at or near the same point; and, secondly, the male and female bathers can be provided with separate and

distinct entrances, both classes of men entering one door, and the women by another entrance. Baths have been erected on both principles; but a modification of the first is the most to be recommended. The separation of the entrance for the sexes is a desirable thing in all bath-houses; but no less desirable is the separation of the classes. It has been found by experience that many of the poorer bathers do not care to enter at such an imposing entrance as is sometimes provided for first-class bathers; and anything that will deter the poor from availing themselves of the baths is to be avoided.

A first-class entrance and a second-class entrance is, therefore, the arrangement to pro-

vide. One pay-box at either entrance will control both men and women bathers. Although men and women are thus grouped together, it is not necessary that they should enter by the same door. On one side of the pay-office will be the entrance for men, and on the other side the entrance for women.

The laundry entrance is, as a rule, better kept distinct from the other entrances. It may, for economy's sake, be one with the entrance to women's second-class baths; but, if possible, it should be separate, as there is so much work occasioned by this department that one clerk's time is required to control the coming and going of the washers.

Site has much to do with the question of entrances. A side street for second-class entrances, and for access to laundry and to boilers, &c., is a very great gain. Commissioners searching for sites might well bear this in mind.

Where, as so often has occurred in London, a narrow, cramped site is the only one available, much skill is required to make the entrances convenient. The whole of the bathers' entrances may have to be grouped into one, men entering on the one hand of the pay-office and women on the other, as in the accompanying illustration, while stokers, engineers, &c., may have to make their way through the laundry entrance.

It is a common practice to make the first-class swimming-bath directly from the hall or vestibule. By this means direct access is gained to one of the most busy departments of the establishment, and provision is made for times when the swimming-bath hall is used for the purposes of entertainment, or when swimming fêtes are held.

Adjoining the first-class entrances, waiting-rooms are required if the site will allow them to be placed in this position on the plan. These waiting-rooms are generally needed only for the slipper-baths, and should therefore be placed in convenient relation to these departments, or the corridors leading thereto. The second-class waiting-rooms will adjoin their respective suites of baths.

Near the vestibule should be the superintendent's office. The living apartments of this official are, as a rule, conveniently placed over the entrances, offices, waiting-rooms, &c., in front of the higher-pitched bath-halls, and giving height and dignity to the front elevation of the baths.

All bath-houses are better when planned on one floor. Some of the London establishments afford examples of baths on a first floor. Such will be found to be the case in some old baths in St. Pancras parish, and in the recently-erected building near Victoria Station, where also is a laundry on an upper floor, considerably elevated, and approached by a lift. A still more recent example is the establishment in the Caledonian-road. In this matter, again, site may necessitate such a contrivance as a first-floor set of baths in order to gain the requisite amount of accommodation on a given area; but the arrangement is to be avoided, if possible. Commissioners appreciating the value of public bath-houses will, even at some increased cost, endeavour to secure sites of such area that all the baths may be on one level.

The boiler-house must necessarily be planned in a basement, and the engines, machinery, furnaces of drying closets, engineer's shop, and coal and coke stores go with it. In deciding the position for the engineering department, the aim should be to select some part of the plan where the noise, heated atmosphere, dust, and other accompaniments of engines, &c., may not be a nuisance either to the establishment or to neighbours, and also where a chimney-shaft can be conveniently constructed. Except in very exceptional cases, nothing will be constructed under the swimming-baths. The boilers, &c., will therefore go under some other part of the establishment—commonly, the laundry and its necessary adjoining apartments. At times it may be absolutely necessary to gain room under a swimming-bath. In such a case the bath must be constructed like a tank, of riveted iron plates supported on columns, as at the St. George's Baths in Argyll-place; or of brick-in-cement rings on iron joists and brick piers, as at the handsome bath lately added by Messrs. Spaulding and Cross at the same establishment.

If more than one swimming-bath be required, and no sacrifice of convenience in working results, it is evidently a saving to group both bath-halls together, so that where one wall is carried up to receive the roof of one bath, it may serve also to carry the adjoining roof. Each swim-

ming-bath, it should be stated in passing, should be completely cut off from its fellows. The objections to the reverse arrangement will be readily perceived on examining any examples, such as that afforded by the out-of-date baths at Endell-street, Bloomsbury, and the otherwise excellent and compact public baths at Richmond, while many of the older establishments exhibit equally unfortunate arrangements. Not to mention other objections, the usually noisy second-class bathers render things unpleasant for those in the first-class bath.

Section XXXVI. of the Baths and Wash-houses Act stipulates that the number of baths for the labouring classes in public baths and wash-houses shall not be less than twice the number of baths of any higher class, if but one, or of all the baths of any higher classes if more than one, in the same building. And Section V. of the Amendment of July 2, 1847, makes similar provision with regard to washing-tubs—viz., that the number of washing-tubs or troughs for the labouring classes shall not be less than twice the number of the washing-tubs or troughs of any higher class, if but one, or of all the higher classes if more than one.

We do not find that, as regards the proportion of first and second class baths, the stipulations of the Act are generally observed. In buildings recently erected the proportion of baths is not in accordance with the provisions of the Act. Commissioners, apparently, have taken the matter into their own hands; but their action is possibly illegal. It may be that at times a different proportion of baths is better suited to the neighbourhood; but Section XXXVI. of the original Act is a wise measure calculated to prevent abuses, and to protect the interests of the classes for whose benefit the Act was brought into existence. As regards the proportion of washing-tubs of several classes, there being usually only one class and charge for the use of the public laundries, Section V. of the Amendment of 1847 calls for no comment.

In a well-planned bath and wash-house there should be a good division of departments, and a compact grouping of classes; corridors should be broad and entrances spacious. The access to swimming-baths, particularly to the first-class bath, should be as direct as possible, and if spare exits can be arranged they will be valuable for any entertainments that may be held in the baths. There should be an endeavour to render the work of supervision of baths as easy as possible, and the entrances and pay-offices should be so arranged as to economise attendance while not sacrificing the due consideration of classes and sexes. As to classes, if two only suffice all purposes, it is far better than three. A first-class swimming-bath at a charge of sixpence, and a second-class bath at twopence, answers all purposes. The first class baths should be large, and all baths should be light and well ventilated. There should be space everywhere for pipes, and no burying of pipes underground, and out of the way, where much trouble, expense, and annoyance are occasioned by efforts to reach them for repairs or alterations.

The accompanying illustration is a sketch-plan for an establishment for site, built in on both sides, but facing streets back and front. Just the ordinary accommodation is provided. It is supposed that one pay-office only has been required by the Commissioners, so both classes enter at the same door, women on the left and men on the right. A separate entrance to public laundry is arranged in the back street, where also is the entrance stokeries, boiler-rooms, &c., which would be arranged under the public wash-house and adjoining apartments. Above the halls, entrances, &c., could be arranged the superintendent's living-rooms, as well as his office and a committee-room. In other points the plan should explain itself.

GARDEN DESIGN AND ARCHITECTS' DESIGNS.*

MR. W. ROBINSON, F.L.S., in his little work under the above title endeavours to show by examples of gardens how absurd and inartistic the practice of clipping and aligning trees is, under the impression that such a style of garden harmonises with the architecture. Mr. Robinson refers to many Continental and British parks and

gardens to prove that the English garden is the most beautiful and artistic. We certainly agree with him. The formal gardenesque style, with its rows of straight beds and trees, has been carried too far by those who do not seem to understand the distinction between ignoring the architecture and formal garden design. There is no necessity to make straight lines of beds and trees, with the object of harmonising the lines of the grounds with the house, because the very conditions of art and nature are different; but there are often opportunities when the natural lines of ground are favourable, as when the ground is flat and the building is of a regular character to introduce a formal setting out near the structure. No doubt there is danger in this geometrical formality being carried too far beyond the confines of the terrace or flower garden, and into the details and arrangements of the beds, and only the true landscape gardener can see where the formal setting-out should stop. Take, for example, Haddon, with its terraces, and many other old English gardens. They are eminently appropriate and beautiful. Mr. Robinson's main arguments are directed to rebut the statements of the authors (Blomfield and Thomas) of the "Formal Garden," and so far he has been successful. The beautiful illustrations of British gardens given confirm the author's opinion, though they do not necessarily disprove the formal style of planting or laying out. We agree with Mr. Robinson that clipped foliage and tortured lines of trees are unnecessary even to formal gardens, and that the natural landscape and contour of the ground ought to suggest the design. To contend that there are no design or lines in landscape is a fallacy.

RELIEF SEWER AT BROOKLYN.

THE main relief sewer of Brooklyn is an important engineering achievement, the results of which in preventing floods will be watched with some degree of interest. To carry away excessive storm-water has always been a problem with sanitary engineers. In London our great intercepting sewers and outfalls answer only moderately well, the difficulty being to find an easy outlet for the storm-laden sewers without a large expenditure of money in constructing relief sewers. Much has been accomplished, however, in relieving the sewers by the construction of independent outfalls, such as that of the Isle of Dogs pumping station and the relief sewer at Deptford. At the Brooklyn sewer the shortest egress to tidal water was given by making the outlet into a canal, which would rather improve the canal, as only the excess storm-water would be dealt with. The city was divided into sewerage districts, the boundary lines of which are the dividing ridges; each is distinct, the main sewers of each discharging into tide-water. The sewers are of various ages and materials, some of vitrified stoneware, of cement, brick, and stone. The drainage area is 2,000 acres, and it has been thought safe to provide for an area of 1,300 acres. The maximum rainfall of Brooklyn is 4in. per hour, lin. of which it is imagined will reach the relief sewer. The sections of the sewer are various, according to circumstances, the circle was adopted as the strongest for loose material, and of least resistance to the full flow. Where there is no head room the crown is replaced by I-beams. At its upper end the sewer is 10ft. diameter, further on it is increased to 12ft. in diameter, at the Grand Avenue it is 14ft., and at a more advanced point 15ft. diameter. A segmental invert, vertical side walls, and a flat top of I-beams, with flat brick arches between is the section in Butler-street, just giving head-room for a row of eight persons abreast, as shown by a photograph in the American Society's *Transactions*. At the different avenues manholes are introduced and put in connection with the surface sewers. The object in every case is to avoid disturbing the house-drainage of the small sewer, only to take from it all water in excess of that from house-drainage. The overflow in one case is oval-shaped, with segmental invert 4ft. 2in. in clear height, and this slopes down from the small sewer to the bottom of manhole just above the tunnel, so that the excess water drops vertically into the relief sewer, the invert of which at these points are paved with granite blocks; the granite is laid on cement and up to the springing lines. The details of these connections of surface sewers and manholes are shown in the elaborate paper of Mr. Beahan,

M. Am. Soc. C.E., which appears in the *Transactions* of the Society, as well as those of the silt or trap-basin at the canal into which the tunnel discharges, a basin 84ft. by 60ft. and 16ft. high. The main relief sewer is stated to have been well planned, and works satisfactorily.

CHIPS.

Messrs. Campbell, Smith, and Co. have just completed a very elaborate scheme of decorations on the grand staircase at the Hotel Métropole, Brighton, under the superintendence of Mr. A. Waterhouse, R.A. The scheme of ornamentation is based on a free adaptation of Italian ornament, containing shells, dolphins, seaweed, anemones, &c., and the colouring is cream, various tones of red, and gold.

The local board of Pudsey, near Leeds, are about to carry out works of sewage treatment on some 3½ acres of land recently purchased at Houghside. Mr. W. Spinks, of Manchester, is the engineer, and the estimated cost is £3,000.

Messrs. W. and G. King, of Abinger Hammer, have been engaged for some three years in carrying out extensive alterations at Hatchlands, the seat of Mr. Stuart Rendel, M.P., near Guildford. These works are now nearly completed.

The Pendref Welsh Wesleyan chapel at Holywell, erected 80 years ago, has been closed this week, as it is about to be replaced by a modern one to be built at a cost of over £2,000. The contractor is Mr. Richard Jones, of Bagillt.

Lord Roseberry has intimated to the Queensferry town council his desire to build a new town hall for the burgh, as a memorial of the late Countess.

Good progress is being made with the branch Free Library at Spring Hill, Birmingham, which is being built at a cost of £5,000. It is of brick and terracotta, with high tiled roofs, a feature being the clock tower, with openwork spire, rising to a total height of 65ft. The style is Decorated Gothic.

The St. Alban's Architectural and Archaeological Society visited, on Thursday in last week, Northchurch and Aldbury, as the two first items in a day's excursion, which comprised also Ivinghoe, Eddlesborough, and Eaton Bray. At Northchurch Mr. S. Flint Clarkson, F.R.I.B.A., acted as guide, and read a paper dealing with the history and characteristics of the church.

Mr. Richard Bristowe, aged 47, a builder, of Stroud Green, died suddenly on Saturday afternoon while driving with his son in a dogcart. At the inquest, held on Monday, the medical evidence showed that death resulted from heart-disease.

Mr. Hugh Owen, an inspector under the Local Government Board, held an inquiry at Widnes on the 16th inst. into an application by the Widnes local board for powers to borrow £12,000 for public and private improvements in the authorised district. The public improvement was the sewerage and construction of Lowerhouse-lane, which it was estimated would cost over £3,000, and the private works were in East-street and Edward-street.

The parish church of Pitstone is being restored. The works in the chancel are being carried out at the cost of Earl Brownlow, and those in the nave, which will cost £1,000, by local subscription. The contractor is Mr. W. Bone, of Lower Tooting. The works include the renewal of the boarding and lead of roofs, the replacing of the decayed flooring in the nave by wood blocks set in concrete, and the substitution of stone for brick parapets.

The sea defence works at Walton-on-the-Naze were formally inaugurated on Wednesday week. These works, which were commenced eighteen months ago, comprise the erection of two new groynes, the restoration of another groyne, and the construction of new breastwork and epiplanade, covering about 2,000ft. frontage. The cost has been about £12,000. The works have been carried out by Messrs. Cooke and Co., of Battersea, and Mr. S. B. Goslin, of 24, Artillery-lane, Bishopsgate, was the engineer.

It has been decided to complete the Roman Catholic Church of St. John at Perth, at an estimated cost of £1,000, as a memorial to Dr. Rigg, the first Bishop of Dunkeld. The works will include raising the roof over the older portion of the church, and the completion of the apse. Mr. Andrew Heiton, of Perth, who added the last section of the church, is the architect.

Oxwich parish church, Gower, Glamorganshire, was reopened on Sunday, after complete restoration, the cost of which has been defrayed by Miss Talbot, of Margam Park, to the memory of her father, Mr. Christopher Rice Talbot, M.P., the late father of the House of Commons. The work of restoring Nicholaston Church is proceeding, the cost of which, estimated at £3,000, being also borne by Miss Talbot. The architects for both works are Messrs. Halliday and Anderson, of Cardiff and Llandaff.

"EVERSLEY," FRODSHAM, SURREY.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES, COMPRISING ST. MARY'S CHURCH, TAUNTON; BISHOP LYDEARD CHURCH; POUNDISFORD PARK; BLACKMORE FARM, SOMERSETSHIRE; BOWER FARM, DUBLIN; AND GOTHELSTONE MANOR.—PREMISES AT LIV.—LVII. BISHOPSGATE-STREET WITHIN.—PROPOSED COTTAGE HOMES, SURREY.—DECORATIVE LIGHTING AND IRONWORK BY MESSRS. RASHLEIGH, PHIPPS, AND DAWSON.

Our Illustrations.

"EVERSLEY," FRODSHAM.

THIS house has just been erected on a hill side to the south of Frodsam. The windows command magnificent views of the Weaver Valley, a very picturesque portion of Cheshire. The work has been carried out very satisfactorily by Mr. Richard Beckett, of Hartford, from the designs of Mr. William Owen, F.R.I.B.A., of Warrington.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

THESE sketches illustrate churches and houses seen by the members of the Architectural Association during the later days of last week's excursion to Taunton and North-west Somersetshire. They are all referred to in our special descriptive report of the proceedings on p. 279.

LIV. TO LVII. BISHOPSGATE-STREET WITHIN.

THESE premises, now approaching completion, have been erected on the site formerly occupied by the premises of the Marine Society, and cover an area of 7,000 super. feet. They comprise basement, ground, first, second, third, fourth, and fifth floors, all approached by a stone staircase and hydraulic passenger lift. The ground-floor front is in red and grey granite, and the whole of the upper part of the front is in Portland stone. The carving has been executed by Mr. Gilbert Seale. The works have been carried out by Messrs. W. Brass and Son, at a cost of £21,000, from the designs and under the superintendence of Mr. T. H. Smith, architect, of 17 and 18, Basinghall-street, E.C.

DECORATIVE LIGHTING AND IRONWORK.

(See article on p. 278.)

The name of Mr. C. J. Ferguson, F.S.A., F.R.I.B.A., of Carden Lodge, Carlisle, has been added to the commission of the peace for Cumberland.

Mr. F. H. Tulloch, one of the inspectors of the Local Government Board, held an inquiry at St. Mary's Hall, Coventry, on Friday, as to an application by the city council for sanction to borrow £1,200 for erecting a room for the preservation of the city muniments. It was stated that there was an exceptionally rich collection of muniments, the present accommodation for which was very inadequate, the rooms being by no means fireproof, and forming part of the old building of St. Mary's Hall. Plans had been prepared by Mr. E. Burgess.

COMPETITIONS.

NEWCASTLE-ON-TYNE.—The town improvement committee of the city council have adopted conditions prepared by Mr. W. G. Laws, the borough engineer, for the proposed lodging-houses. Premiums will be offered, and the competition will be restricted to architects practising in Newcastle.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The forty-ninth congress of this association was opened at Cardiff on Monday, under the presidency of the Bishop of Llandaff. A visit was paid to Llantrithyd, where Mr. Mansel Franken described the ruined mansion-house. Mr. S. Williams conducted the party round the ruins and to the adjacent church, where there is a monument to John Bassett and his wife, Elizabeth, erected to their memory in 1597. Mr. Edwin Seward, R.C.A., pointed out the peculiar classic treatment in the details of the Jacobean carving of the tomb. The tower of Cowbridge Church was then inspected, and the ancient gateway and fragment of the town hall were pointed out to the party by Mr. Franken. At St. Quintin's Castle the gateway, c. 1310, was seen to be fortified after the Edwardian manner, with loopholes on either side for four cross-bowmen, an arrangement found also at Carnarvon and elsewhere. The party proceeded to Llanfihangel, where Mr. Williams pointed out the chimney-piece of the mansion, date about 1550, ornamented with carved coats of arms of successive owners. The church tower close by is furnished with narrow slits for archers. Here the old font, the base stones of a churchyard cross, and the quaint effigy now in the churchyard, but formerly in the church, attracted attention. A short halt was made at Flemingstone, and the porch at old Beaupré was described by Mr. E. P. Loftus Brock and Mr. Seward. The members received a public welcome from the Mayor and Corporation of Cardiff on Tuesday. Mr. Allan Wyon, F.S.A. (treasurer of the Association), and Mr. Loftus Brock, one of the hon. secs., spoke in acknowledgment. The members afterwards proceeded to Margam Abbey, where a paper was read by Mr. Brock descriptive of the Chapter-house of the Abbey; and the unique collection of inscribed stone crosses was spoken upon by Mr. T. H. Thomas, R.C.A. On Wednesday the members had an excursion by road to Ruperra Park, where the owner, Lord Tredegar, acted as guide, and led the way to some prehistoric mounds; to Caerphilly Castle, described by Mr. Robert Drane; and to Castell Coch, rebuilt for Lord Bute on the foundations of a Mediæval castle. A visit to Llandaff Cathedral was on the programme, but was abandoned in favour of tea and a garden party at Rookwood House. In the evening a meeting was held at the Town Hall, Cardiff, where papers were read by the Rev. H. Gart and the Rev. W. David.

The interior of Lloyd's (late Bristol and West of England) Bank, in Corn-street, Bristol, is in course of restoration, the work being carried out by Messrs. Cottrell and Wilkins, under the superintendence of Mr. H. J. Williams, architect, Clare-street, in that city.

The chancel of the parish church of Llandyfodwg, diocese of Llandaff, is about to be restored. The work will include a new oak roof and stalls. The tower arch, built up in 1870, will also be done up and carefully repaired. Messrs. Halliday and Anderson, of Llandaff and Cardiff, are the architects.

The new water supply for Pontefract, derived from springs at Roall, has just been inaugurated. It has been carried out by Messrs. Vickers and Son, of Nottingham, the engineer being Mr. G. Hodson, of Loughborough.

The first stage of deepening the natural harbour of Aden to a depth of 20ft. below low-water has just been completed. The second stage of the deepening will be carried out to a depth of 26ft. below low water, and will commence forthwith. The dredging operations were commenced in December, 1890, under the supervision of Mr. W. S. Child, A.M.I.C.E., who has also charge of the works about the harbour.

On Tuesday, a new Wesleyan chapel was opened at Harpham. The building had been erected from plans prepared by Mr. Dyer, Bridlington, by Mr. Owston, bricklayer, Bridlington Quay, and Mr. Day, joiner, Harpham, at a cost of £500.

Engineering Notes.

HELMSDALE, N.B.—The foundation-stone of the works for the improvement of Helmsdale Harbour, on the east coast of Sutherlandshire, was laid by the Duke of Sutherland on Saturday. The works in progress include a new breakwater on the south side of the river, extending in an easterly direction for a distance of 700ft.; an extension of the existing pier on the north side of the river for 470ft.; a new breakwater and quay wall 450ft. long. This breakwater and extension will inclose about three acres, which will be divided into an outer and inner basin by a jetty, with discharging berths on each side. The works have been designed by Mr. James Barron, M.Inst. C.E., Aberdeen, and are estimated to cost £16,000. The trustees will execute the works under the superintendence of the engineer without a contractor.

ST. HELEN'S AND LOWTON RAILWAY.—Good progress is being made with the construction of the first section of the proposed Liverpool, St. Helen's, and South Lancashire Railway. The section extends from Lowton to St. Helen's, and upon it the contractors, Messrs. S. W. Pilling and Co. of Manchester, have some 500 men at work, besides two steam navvies and the usual plant. The line passes over an extensive coal-field, and there will be intermediate stations at Golborne, Ashton-in-Makerfield, and Haydock, between Lowton and a central station in Corporation-street, St. Helen's. This section of the line is to be opened for passenger traffic next year. The railway will eventually be carried on to West Derby and Liverpool, with stations at Denton's-green, Knowsley, and Croxteth Park.

CHIPS.

During the past week the booking-offices, waiting-rooms, and station master's residence at Frodsam railway station, weighing some 400 tons, have been moved back bodily 6ft. by means of eleven screw-jacks. The operations were carried out under the superintendence of Mr. Johnson, the engineer to the joint companies, and were quite successful. The work was undertaken to provide additional width on the platform.

Canon George Venables, in a report on Church work in the diocese of Norwich, states that during the last 18 years 297 churches have been built or restored in the diocese, the money raised for the purpose, entirely by voluntary gifts, exceeding £500,000.

An American patent has been taken out by Jacob D. Graybill, of Shreveport, Louisiana, for preserving the colour of brickwork by preventing efflorescence. The preparation is said to fill the pores of the bricks with an oily mucilaginous substance which, when dry, is hard and waterproof, preserving the brilliant red colour of pressed bricks as when first laid, there being in the compound a small quantity of Venetian red.

The parish church of Llanwouno, diocese of Llandaff, is about to be restored. The work will include oak roofs throughout and reseating. A vestry will also be added. Messrs. Halliday and Anderson, of Cardiff and Llandaff, are the architects.

The Leeds school board have decided to invite competitive designs for plans for the proposed new schools in Darley-street. The competition is to be limited to architects practising in the borough of Leeds.

Memorial stones of a Wesleyan school in course of erection adjoining the chapel in Garfield-road, Ryde, were laid on Thursday, the 18th inst. Mr. Boreham, of Finsbury-pavement, E.C., is the architect, and Mr. E. James, of Binstead, I.W., the contractor. The cost will be £1,500.

At the Bristol police court on the 17th inst., Mr. George Henry Wilkins, builder and contractor, was summoned under the Factory Acts for opening a factory or workshop without forwarding a notice containing the name of the factory, its situation, and other particulars to the authorities, as prescribed by the Act. Mr. Johnson, Inspector of Factories, stated the facts, which were admitted, and the defendant was fined 10s. and costs.

The new public buildings at Bodmin will be opened in October next. Mr. Trehane is the contractor.

Mr. Richard Halfnight's landscape, "Summer Time," has been purchased by Mr. Backhouse, and presented to the Sunderland Art Gallery. It forms a contrast to "Daylight Dies," an earlier work by the same artist, already in the collection of the Sunderland corporation.

Examples of Work executed by
RASHLEIGH PHIPPS & DAWSON
of 53 BERNER'S ST W.
& STANHOPE ST,
N.W.

WAYSIDE NOTES.

THE Association have been having glorious weather for the excursion in north-west Somersetshire, and the touring members should return to town with faces as full of colour as their sketch-books of sketches. Judging from the accounts of the wanderings about Dunster and neighbourhood, the excursion has been one of the most successful undertaken by the A.A.

The Society of Architects should have had another excursion "up their sleeve." To relinquish the idea of going to the Continent, when hundreds are daily dropping down dead—or nearly so—with a plague of cholera was only exercising wisdom; but surely there might have been another excursion in England, Ireland, or Scotland, not to mention Wales, which would have been a good substitute for the abandoned Continental tour. The old country still provides a practically inexhaustible fund of old architecture for excursionists, and really, I expect, home tours prove the most generally pleasing, and afford instruction not inferior to that obtained in any part of the Continent.

The usefulness of a tour of this nature should depend upon the particular fashion in architecture at the time of touring. Thus we hear so much now of Spanish—it should be, perhaps, "Spanish" detail—that a tour in Spain should be a profitable undertaking, particularly for the competing architect, since this Spanish craze seems to have been particularly noticeable in recent competition designs. The Dutch and Flemish mania having somewhat worn off, touring in Holland and Belgium cannot be said to be so profitable as heretofore, although these countries always repay a visit by the architect. Normandy seems to me the country *par excellence* for a sketching tour. There one finds matter for sketching and study that must always be useful to the architect, since most of the old architecture is intrinsically beautiful, and admiration for it does not depend upon peculiar tastes and fashions and crazes. This is a point to be noted—Dutch, Spanish, and some other styles of design may be admired one day and derided the next. The younger students of architecture should always be encouraged to go sketching in a country with a really noble architecture, and to defer visiting districts with less pure styles until their judgment is more mature.

Endeavours are periodically made to make out that the plays of Shakespeare are written by anyone but Mr. W. S., and so likewise the reputation of other authors, discoverers, &c., is assailed. Some persons appear to make this kind of game their special recreation, and it is to be supposed that they are of some use in the world, and have their reward. The latest in this way is an attempt to rob the great Christopher Columbus of the merit of first discovering America to the Old World. M. Napoleon Ney, president of the Society of Commercial Geography of Paris, takes advantage of this year's celebration of the fourth centenary of the discovery of America by Columbus, and puts in a prior claim for the French, averring that 800 or 900 years ago the coast of North America, as far as the Arctic regions, was visited by Europeans. M. Ney reminds one of the persons who argue that Stephenson did not invent the locomotive. To all practical intents and purposes he did do so, and Columbus, for all practical purposes, first discovered the continent of America. A more interesting and useful subject of inquiry with respect to pre-Columbian days in America would be the nature of the old ruins in Central America that heretofore have baffled the archaeologists of the world.

A feature of the Chicago Exhibition will be a great hotel in the shape of an elephant. A "howdah" on the back of the elephant will serve as an observatory, and will be two hundred feet above the ground. This elephant hotel will contain lodgings for about seven hundred people, and its erection is to be commenced in a few days. What next? A church in the shape of a cat might be suggested, its erect tail forming the tower and steeple. This is novelty indeed, not to say architecture extraordinary.

Mrs. G. A. Sala, the wife of the renowned author and journalist, has been writing against

the London "flat." Not ever having lived in a dwelling of this kind, I cannot speak from experience; but from observations made, I should be quite of Mrs. Sala's opinion as to the delusive nature of the comforts of such places, and the superior delights of possessing a tenement of one's own, even if the hall-porter be unknown therein, and letter-shoots and other conveniences of the flat altogether wanting. That the "flat" system of living answered for a time there is abundant evidence in the huge blocks of residences in London at the present day. How the holders of flats now find things I do not know; but one can see many buildings practically empty, that must be white elephants to their owners. I doubt whether it is found that flats let on a long term, and should imagine that the suites of rooms change hands very frequently, and that were it not for the large floating population of London, their owners would be great losers. Mrs. Sala thinks that not the tenements, but the people who take them, should be called "flats." It may be a matter of taste, but to those with a real love for a home, the flat must seem but a poor substitute for a house that may be called one's own.

The flat builder may be said to be a common enemy of all architects. Between those who put together overgrown suites of rooms on the flat-system in London and the speculative builder who runs up desirable villas and houses in the more outlying suburbs, the architect is deprived of much work. In the one case it is direct, in the other indirect. Men provided with flats will not want to build themselves houses, and those who do cast about for a domicile of their own frequently get into the net of the jerry-builder, and buy a shoddy house ready made. Later on, perhaps, many such a one finds out that neither the flat, with its bad odours, and lifts, or long flight of steps, and other drawbacks that Mrs. Sala has ably detailed, nor the jerry-built house, with its defective drains, thin walls, and shrunken joinery, are calculated to give a sense of home comfort. Then is the time when the architect "takes his benefit," and paterfamilias builds himself a house after his own heart. Possibly, therefore, the flat and the jerry-built house ultimately do good to the architectural profession by causing men—who, did they chance upon a well-built house, or a flat having really the comforts that such a residence is supposed to have, would settle where they alighted—to leave their dwellings and build homes for themselves.

GOTH.

CHIPS.

Sir James Sawyer, M.D., gave a house-warming reception last week to celebrate the completion of the alterations he has effected to Haseley Hall, near Warwick, which, since he purchased it, he has refitted and enlarged from plans by Messrs. Wood and Kendrick, of West Bromwich. It is now a mansion of Early Elizabethan character, a chief internal feature being a new oak staircase. Mr. Rowbotham, of Birmingham, was the builder.

Work in connection with the enlargement of the Wesleyan chapel in South-street, Farnham, Surrey, has commenced, the contract being secured by Mr. H. Patrick. There will be a new front and a tower 60ft. high erected.

The city council of Manchester, after much discussion, have decided to purchase for £49,000 the Rampton Manor Estate, Nottinghamshire, covering 1,800 acres, for the purpose of dealing therein with the refuse of the city.

In the case of the application for a discharge from bankruptcy, made on behalf of John Coleman, of Hubert's-grove, Stockwell, builder, the discharge has been suspended for two years and six months. A similar order of suspension of discharge for 2½ years has been made in the case of Robert Humphry, of Hove, late of Burgess Hill, Sussex, builder.

The post-office at Woodbridge has just been enlarged by an additional floor, and the interior rearranged. Mr. Adams, of Woodbridge, was the contractor.

Mr. Ernest H. Johnson, late a district surveyor of roads under the Norfolk County Council, has been appointed surveyor to the Condover highway board in the stead of Mr. Hendry, resigned.

The first sod of St. Anne's-on-the-Sea drainage scheme was cut on Thursday in last week. The scheme is from plans by Mr. Bancroft, engineer, of Manchester, and the work is being carried out by Mr. Nuttall, contractor, of Manchester, at a cost of about £9,000.

Building Intelligence.

EDINBURGH.—Considerable improvements are being effected to various public school buildings in the city. The School Board, from plans prepared by their architect, Mr. R. Wilson, Queen-street, Edinburgh, are making an addition to the south-west end of South Bridge school, to provide three class-rooms, the upper one to be set apart for teaching practical cookery. The alterations will cost about £1,900. New practical cookery rooms are also being constructed, from Mr. Wilson's plans, at Causewayside and Dean schools, while other rooms are being turned into practical cookery rooms at West Fountainbridge and Bristo schools. At Lothian-road school and at Regent-road school, boys' playsheds are being erected. For the St. Cuthbert's and Dean School Board, a janitor's house has just been completed at Gorgie, and their new school at South Morningside is expected to be opened on 5th September. For the Merchant Company, extensive additions are now in progress at George Watson's College for Boys, the plans for which were prepared by Messrs. Macgibbon and Ross, Frederick-street.

LINLITHGOW PALACE.—The partial repairs and improvements, which are being carried out by H.M. Office of Works at Linlithgow Palace, are being rapidly carried through, and the work is expected to be completed towards the end of the present month. The floors of the apartments known as the King's kitchen, the old Parliament hall, the chapel royal, the priest's residence, and the confessional have been laid with concrete. All the chimneys on the north side have been rebuilt, and a new course of drainage has been laid, a connection having been obtained with one of the original earth closets.

WEMBLEY: THE PROPOSED LOFTY TOWER.—The report presented to the shareholders of the Tower Company, on Wednesday, stated that the foundations of the proposed tower had been constructed on the estate at Wembley, Middlesex, roads, bridge approaches, and an ornamental lake formed, the grounds carefully laid out, drained, and planted, and the portions of the proposed tower grounds had been fenced in. Upon these works a sum of £25,436 had been expended, exclusive of the cost of the land. The Construction Company were now arranging to commence the tower works, and it was proposed to open the park for public use next spring. Sir E. W. Watkin, in moving the adoption of the report, said that the directors of the Tower Company had that morning made arrangements for the Wembley-park Station to be opened in a very few weeks. It had also been practically settled that morning the kind of tower which would be constructed. The proposed tower would be 150ft. higher than the Eiffel Tower. It would be a tower capable of taking up three times as many passengers as that one, and it would have three times larger an amount of floor-space, and be erected at a smaller cost than was at first thought possible. Some £90,000 were in hand, and about £12,000 to £14,000 more were required. Mr. H. Heenens explained the designs of the proposed tower, and it was stated that the plans would be reported upon by a very eminent engineer so as to remedy any defect in its design. The tower would be completed in 18 months.

WEST DERBY.—A new Roman Catholic cemetery for Liverpool is in process of formation in Yew-tree Park, Finch-lane, West Derby. It will consist of some acres, which are railed off and are being drained and laid out in plots, with intersecting pathways, by Messrs. Pain and Bleasde, of North John-street. Dr. O'Reilly, the R.C. Bishop of Liverpool, recently blessed the foundations and laid the corner-stone of the mortuary or cemetery church, to be dedicated to Our Lady of Compassion. It is being built by Messrs. Waring, of West Derby, from designs by Messrs. Sinnott, Sinnott, and Powell, of Harrington-street, Liverpool, and will be in the Early English style, constructed of local red stone rock-pitched, and Runcorn stone dressings. The church will be cruciform in plan, and the internal joinery will be of pitch-pine. It will be finished in about five months, and the estimated cost is £1,800.

A new English Presbyterian church is in course of erection at Mold, and will be opened in November. Mr. Thomas Roberts, of New-street, Mold, is the contractor.

STEEL IN CONSTRUCTION.

THE rapidly increasing favour with which steel is now regarded as a material for general construction, and the position which it is ultimately likely to hold, render a study of its nature and possibilities of more than ordinary importance. The various substantial advantages which may be gained by its use, in the matter of greatly increased strength, and consequent saving in "dead load," together with the greater facility in handling, make it more than likely that it will ultimately supersede both cast and wrought iron.

Objections to Use.—The greatest drawback at the present time to the general employment of steel is that the Board of Trade regulations prohibit a greater working stress than $6\frac{1}{2}$ tons per square inch. This amounts to an increase of only about 30p.c. over the 5 tons allowed for wrought iron, whereas if care is taken to procure the best material, it may safely be regarded as 50p.c. stronger. In the case of the Forth Bridge, this regulation was not insisted upon, and a working stress of $7\frac{1}{2}$ tons was allowed.

Another objection to the use of steel is that under ordinary circumstances it corrodes more quickly than wrought iron, and very much more so than cast iron. The comparative liability to oxidation has been given as follows:—Cast iron, 100; wrought iron, 129; steel, 133. Considerable variation may be caused, however, by the different corroding agents acting upon the material. A formula is given in Molesworth's "Engineers' Pocket-book," together with a table of the coefficients for the several agents, from which the results likely to occur under the various circumstances may be accurately arrived at. The fact should be borne in mind, however, that the result is to some extent dependent upon the quality of the metal. Mild steel will in every case corrode more rapidly than hard steel.

Terms of Specification.—In specifying for steel for ordinary roof and girder work, it is usual to insist that the metal shall be capable of sustaining a minimum tensile stress of 28 tons per square inch and a maximum of 30; that the elongation in a length of 8in. shall be 20 per cent., and that the contraction of area at point of fracture shall be 40 per cent. In addition to these requirements the limits of elasticity should be fixed at 15 tons, and the specific gravity (which in the case of steel is a fairly reliable test) at 7.9. With regard to the advisability of specifying the chemical composition and process of manufacture, there is at present some difference of opinion. In the report recently published by the committee appointed by the Society of German Engineers, it is stated that "the physical properties afford a sufficient index to the composition of the metal, and the result depends not only on the quantitative identification of the component substances, but also upon their mechanical combination." Further, respecting the method of production, "the committee are of opinion that the specification must be limited to such general normal conditions for the identification of quality as can indubitably be conformed to, and that any minute limitations are technically impracticable, without result, and commercially injurious." On the other hand, the Austrian Society of Engineers and Architects, after an elaborate series of experiments, have arrived at the conclusion that Siemens steel (basic process) is indisputably the best material for engineering purposes.

Quality of Steel.—The quality of steel generally used in construction is mild steel, containing a percentage of only 0.35 to 0.60 of carbon. The desirability of employing a softer material, even at the sacrifice of strength in positions where vibration takes place, need hardly be pointed out. Hence the advisability of fixing a maximum as well as a minimum strength.

Steel Rivets.—The fact of the shearing strength of steel being only about three-fourths of that of its tensile strength, whereas in the case of wrought iron the one is equal to the other, would make it at first appear that iron rivets are slightly stronger than steel, and it is by no means an uncommon thing to see it stated that iron rivets should be employed in steel structures on account of this superiority. The statement, however, is not well founded. The shearing strength of steel may be regarded as $5\frac{1}{2}$ tons per square inch as against 5 for wrought iron; in addition to which the fact must be borne in mind that the ultimate shearing strength of wrought-iron rivets when used in steel plates is reduced from 22 to 16 tons per square inch. The great objection to steel rivets is that, when fixed by hand, the heads

frequently split and fly off, as they do not retain their heat so long as iron ones, and the metal when worked at a "blue heat" is always unreliable. This rapid loss of heat is fully appreciated in riveting steel-plate boilers, as the spring of the plates having less time to act upon the metal while in a soft condition, the holes filled with steel rivets are less likely to "weep" than those filled with iron ones.

The shearing strength of steel rivets being smaller than the tensile strength of the plates, joints will require a larger rivet section than would be required with iron plates—the necessary section being proportional to the quality of the plates; consequently, the saving which is effected in the number of covers owing to the larger sizes in which steel plates can be procured compared with iron, is to some extent neutralised by their greater length.

The proportions of steel rivets should be larger than those usually adopted for iron ones.

Before leaving the subject of rivets it is perhaps as well to mention that in calculating rivet sections for either iron or steel, it is unwise to allow for the full working strength of the rivets, and, in actual practice, steel should be taken at 5 and wrought iron at $4\frac{1}{2}$ tons, for the reason that the stress frequently acts upon a group of rivets, some of which have to sustain a much greater stress than others.

Annealing.—The effect of annealing upon steel is the same as upon wrought iron. It increases its ductility while lessening its tensile strength. It therefore follows that though very useful for hard steel, it is, as a rule, unnecessary for the softer varieties. Steel plates $\frac{1}{2}$ in. thickness and over should, however, be annealed after punching, by which means the loss in strength and ductility is restored. Plates under this thickness do not need this precaution, the loss of strength being comparatively little.

In cases where punching is absolutely necessary and annealing cannot be done, the holes should be punched with a smaller diameter than required, and then rimed out.

Clauses of Specification.—The following clauses taken from a specification prepared in the Government offices will be found useful in specifying for steel work.

Strength and Quality.—The steel shall not fracture under slowly applied tensile stresses, or with elongation, less than are shown in the following table against each variety respectively:

	Tensile stress. Tons per sq. in.	Elongation in 8in. length.
Steel plates, bars, angles tees, and channels ...	(Max. 32) (Min. 28)	20 p.c.
Steel joists	(Max. 32) (Min. 28)	20 p.c.
Steel for rivets and bolts	(Max. 20) (Min. 26)	25 p.c.

Plates, Bars, &c.—Strips, $2\frac{1}{2}$ in. wide, cut lengthways or crossways, heated uniformly to a low cherry red, and cooled in water of 82° Fahr., must bend double in a press, to a curve with an inner radius equal to one and a half times the thickness of the sample tested without showing any signs of cracking.

Rivets and Bolts.—Steel rivets must bend double, when cold, on a radius of half their diameter, and when hot must close double, without cracking, and bolts must bend cold to 90° on a radius equal to their diameter, and when hot must bend double on a radius half their diameter, without cracking.

General Forge Tests.—Plates, angles, tees, or other sections shall also stand such forge tests, both hot and cold, as may be sufficient in the opinion of the inspecting officer to prove soundness of material and fitness for the service intended.

Treatment of Steel.—All plates, bars &c., required to be bent are to be bent cold if practicable. If the whole cannot be bent cold, as little as possible is to be heated. When plates, bars, &c., have been heated, no work is to be done upon them after their temperature has fallen to "blue heat," say, 400° to 600° Fahr. Should this limit be reached, the work must be reheated, and is not to be hammered cold on any account. Plates or bars which have been much worked hot, and which have been reheated, must be afterwards annealed, such annealing being done simultaneously over the whole piece when possible.

Castings, Annealing and Testing.—All steel castings to be carefully and thoroughly annealed by keeping them at 1700° Fahr. for 24 hours, and then

gradually cooling without being exposed to the air. Completed castings may be subjected to a percussive test, those weighing over 15cwt. each to drop 12ft., and those under 15cwt. to drop 15ft., without breaking, on to an iron slab firmly bedded. One casting in 50 may be tested.

In addition to the above, clauses relating to the following points should be inserted:—

1. Hydraulic riveting to be done wherever possible.

2. Members to be so placed that the fibres will run in the direction of the greatest strain.

3. All bending which may require to be done is to be effected by crushing, and not by hammering. S. H. DAVIES.

OBITUARY.

MR. FELIX JOSEPH, the well-known art connoisseur, died on Saturday at Southsea, aged 52 years. He had been in weak health for some time past. Mr. Joseph was a considerable authority on art generally, and especially on ceramics. Of the latter he possessed as fine a collection as could be found in England. He was born in London in 1840, and was the son of the late Mr. A. Joseph, a widely-known expert in matters relating to art. Mr. Felix Joseph was educated at Ghent, and subsequently joined his father in his business in London. On the death of Mr. A. Joseph, his son, who inherited a handsome fortune, retired into private life. Mr. Felix Joseph soon became an ardent collector of old Wedgwood ware, and his collection is now in the Nottingham Castle Museum, to which institution he had been a great benefactor since its opening in 1878. In recognition of his many services to art, and the high esteem in which he was held in the town and county, the Nottingham Corporation commissioned Mr. Knight Warren to paint a full-length portrait of Mr. Joseph to be placed in their Castle Museum, which was hung in Gallery V. of the late Academy Exhibition. Among the other provincial museums of which he was a benefactor are those of Maidstone, Norwich, Sandgate, and Derby.

CHIPS.

Another of the City churches is doomed—that of St. Mary Magdalen, Old Fish-street, which now has affixed to the door a notice to the effect that the site is to be let on a building lease; the architect is Mr. W. Wimble, of 9, Queen Victoria-street, E.C.

The Lord Chief Justice and Mr. Justice Cave, sitting in Queen's Bench, have granted a rule nisi for a mandamus to compel the corporation of Rochester, as the local sanitary authority, to carry out drainage works in the village of Borstal, the order having been made after inquiry by the Local Government Board inspector.

At the annual Congress of the British Institute of Public Health held in Dublin on Thursday in last week, Sir Charles Cameron presiding, a resolution was unanimously adopted in favour of the appointment of a Minister of Public Health, and recommending an immediate sanitary survey of the United Kingdom.

A bronze statuette of Minerva, only 4½in. in height, was discovered a fortnight since in the cloister garth at Lincoln Minster by the workmen engaged in making a drain to carry off the rain-water from the cloister roof. The goddess is represented as erect, clothed in a tunic without sleeves. Over the tunic she wears a cloak, and over that a chlamys. The breast is protected by an ægis, and the head by a crested helmet. The figure is perfect with the exception of the spear and shield once carried in the hands.

The firm of Messrs. J. Easton and Son, quarrymen, stone merchants, and masons, Exeter, a business established more than half a century ago, have found it necessary to extend their works. Their business having outgrown the accommodation provided in their old premises, Northernhay-street, the firm has acquired property adjoining, which extends up the street as far as Maddock's-row. On this site long ranges of sheds and workshops have been built, and the ground levelled.

The designs submitted by Mr. A. Savel for the east window of Llangynwyd parish church has been accepted, the subject being the Ascension. The same artist has been commissioned to execute the four-light west window—the subject the Four Archangels. Messrs. Halliday and Anderson, of Cardiff and Llandaff, are the architects for the restoration.

The saw-mills of Messrs. Jonas Brown, Brown, and Son, of Leeds, were completely gutted on Sunday night within an hour of the outbreak of fire.

Legal.

INSANITARY HOUSES.

THE old common law of landlord and tenant is still in force, so that even if a house be quite uninhabitable, the tenant must pay his rent all the same. Nor can he recover damages or compensation for injuries caused to the health of himself or his family by reason of the bad state of the drainage, unless he can show either an express warranty that the drainage was good by the landlord, or a knowingly false representation as to its sanitary state, by which he was induced to become the tenant. The result is generally that landlords and their agents decline to say anything at all specific about the state of the drains, and thus leave the intending tenants to find out for themselves, or to take the risk of entering into possession without any inquiry. The *Lancet* has just issued a very valuable report made by its own Special Commission on "Sanitation in Relation to the Law and Practice of House Letting," which contains much useful matter. Apart from the point of law that landlords should be made legally liable for the state of the houses they let upon the broad ground of principle and common sense that a house should be fit for its obvious purpose of sanitation, for the letting of a house should always carry an implied warranty that it was habitable, this report makes other suggestions.

Considered from a public point of view, the question ceases to be one for legal settlement merely between landlords and tenants as individuals, and becomes a subject for general legislation on behalf of the community. This commission therefore recommends that the desired improvement in house sanitation should be obtained in one or all of three ways—(1) By a combination of house agents and surveyors; (2) by further legislation; and (3) by making sanitary authorities employ the powers they already possess. No doubt surveyors can do, and are doing, a great deal in the desired direction, and are endeavouring to pass a more stringent statute; but to begin with, the existing Acts ought to be better enforced than they are generally. It appears that at Eastbourne the local authority has been granting certificates to owners who voluntarily submit their houses to sanitary inspection, and that this plan works very well indeed. Certainly it seems to be a simple and effectual method of using self-interest for the public good, and so is worthy of general imitation.

FRED WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning to insure answer same week.

The syllabus of the courses on architecture and building construction for the forthcoming session of the Glasgow and West of Scotland Technical College has just been published. The lecturer, as in the past, is Mr. Charles Gourlay, A.R.I.B.A., of Glasgow. The new features of the present session include the division of the lectures on Architecture, previously forming one course, into four courses; and the honours stage course in Building Construction is extended, while the Art classes for architects are now conducted by Mr. Lewes R. Crosskey, art master. All the classes are arranged to suit the R.I.B.A. examination scheme.

The refooring of the nave of Manchester Cathedral and the erection of the new south porch and baptistry, now in progress, will not be completed until the beginning of October. In the mean time all the services, Sundays and weekdays, are being held in the choir.

At an inquest held at Stockport on Tuesday, on Joseph Sutton, aged 41, the evidence showed that Sutton was in the employ of Messrs. T. and W. Meadows, contractors, and whilst working on a ring spinning mill being constructed in Breinksway he fell from the top floor to the ground, and was killed. He was fixing the iron flooring, when he stepped on what was described by one of the witnesses as a "trap"—an opening between some loose planks which were in use as a standing place, being laid across the joists. The jury viewed the scene of the accident, and agreed with the coroner in urging that such a dangerous mode of working should not be allowed, but that the planks should be joined together, as loose boards were very liable to get out of place. A representative of the contractors agreed to recommend Messrs. Meadows to carry into effect the wishes of the jury and coroner.

LEGAL INTELLIGENCE.

IN RE J. G. ROGERS, PORTSMOUTH.—The statement of affairs in the failure of Joseph George Rogers, builder, and member of the Portsmouth Town Council, shows gross liabilities amounting to £23,714, of which £22,714 is due to secured creditors, whose securities the debtor estimates as likely to show a surplus of £4,110, which would more than meet the unsecured creditors' claims. The failure is the fourth of the kind due to the collapse of the Portsea Island Building Society. The debtor was a speculating builder who had been in business twelve years. He was formerly a journeyman joiner, and started without capital, but two years later received assistance from the building society secretary (who is now in custody), who continued to finance him nearly up to the time of the crash.

SINGULAR ACTION BY BUILDERS AGAINST ARCHITECTS.—In the High Court of Justice, recently, an action was heard before Mr. Kemp, an arbitrator appointed by Mr. Justice Charles, between Messrs. Hayward, Penton, and Hayward, builders, of Bournemouth, and Messrs. Brown and Gordon, architects, of Whitehall-court, City, to recover a sum of £350 in respect to architects' and surveyors' charges upon the recent enlargement of Bourne-hall, and the new wing and billiard-room. It appeared that Dr. Philpotts, as managing director of the Bourne-hall Company, had paid the defendants direct, as architects' fees, a sum of £662 9s., and that the defendants had drawn through the builders, on certificates issued by them, a further sum of £359 1s. 6d. The evidence for the plaintiffs was that the defendants were only entitled to five per cent. for fees, and certain other incidental charges, and the defendants, when asked to make a detailed claim, put in a sum of £225 for travelling and hotel expenses to and from London on the work at Bourne-hall, and other charges beyond their fees as surveyor, which plaintiffs were bound to pay, amounting to about £350. The case occupied two days in hearing, the witnesses examined for the plaintiffs being Mr. Penton, Mr. John Donkin, architect, of Bournemouth, Sir Arthur W. Blomfield, A.R.A., and Dr. E. P. Philpott. The witnesses for the defence were Mr. Darward Brown, Mr. Robert Griggs, F.R.I.B.A., and Mr. Thomas Frederick Armstrong, chartered accountant, of 89, Gresham-street, City, at one time secretary to Bourne-hall Company, until transfer and allotment. The arbitrator has since reported to Mr. Justice Charles that £237 15s. 8d. was to be returned by the defendants to the plaintiffs, and a verdict has accordingly been entered with costs against the defendants.

IN RE T. E. THORPE, OF BRIGHTON.—At the Brighton Bankruptcy Court, on the 18th inst., before Mr. Registrar Jennings, Trayton Edward Thorpe, Victoria-street and Marlboro'-street, Brighton, builder, presented himself for his public examination. The statement of affairs showed gross liabilities, £1,616 17s. 2d., of which £574 5s. 8d. was expected to rank for dividend. The assets were put at £394 17s. 8d., leaving a deficiency of £179 8s. In reply to the Official Receiver (Mr. Cully), the debtor said he commenced business in 1870, taking jobbing work. He had practically no capital. He commenced to take contracts about 1876, and, of late years, finding that hardly any jobbing work came in, he tried speculative building, the ground landlords advancing money. He attributed his failure to pressure of creditors, slight loss for under-estimating, and inability to realise the property he had built. The examination was closed.

AN ARCHITECT'S FEES.—At the Derby County-court on the 18th inst., John Nuttall, architect, claimed the sum of £18 3s. 1d. from Mrs. E. Goodwin, of Ashover, for professional fees. The defendant ordered plans for a house and cottage, and these not meeting with her approval, another set was prepared. Defendant admitted the charge; but said she had not the money with which to pay the bill, as it was in the hands of her lawyer.—His Honour said she appeared to have been building to the extent of £229 on one contract, and she would have to pay this claim.—Defendant said she had not a half-penny coming in, as the property was sold, and it had only left her an annuity.—Judgment for the plaintiff for the full amount.

IN RE TURNER, SON, AND EVANSON.—In this case the debtors, who carry on business in partnership as contractors at Stanley Bridge Wharf, Chelsea, have filed accounts showing liabilities of £13,792, of which £8,551 is expected to rank, and assets £2,648. The business was established about 40 years ago by Mr. Thomas Turner, who in 1886 was joined by his son, Mr. Arthur Turner; and in June, 1891, Mr. F. M. Evanston joined the firm. The debtors attribute their insolvency to losses incurred in connection with a contract taken by them for the construction of Rosebery-avenue, also to their drawings for household and personal expenditure, and to depreciation in value of stock and machinery.

ALLEGED NEGLIGENCE IN HOUSE DRAINAGE OPERATIONS.—EMERY V. CAFE.—At the Brighton

County-court on Friday, Arthur Emery, of Lansdowne-street, Hove, builder, sued Mrs. F. Cafe, wife of Major Cafe, for £40 17s., balance of account for work done at 93, Lansdowne-place, Hove. Defendant had entered a counter-claim amounting to £15 4s. for damages alleged to have been sustained by the negligence of plaintiff in the execution of the work, and paid into Court the difference between the claim and the counter-claim. The work for which he claimed was carried out according to the estimate, under witness's superintendence. The work included the taking up of an old drain and the laying down of a new one, which he did to the satisfaction of the sanitary authorities. He noticed cracks in the partition wall, but they were not caused by the work witness did. Two men in the employ of the plaintiff said that the work was properly done, and that they put in plenty of timber support for the wall. Henry Brownrigg, sanitary inspector to the Hove Commissioners, stated that the excavation was properly timbered. The work was done properly, and he passed it. Mr. Boxall, for the defendant, submitted that the work was negligently done, and by digging under the party-wall the workmen caused a settlement. Mr. Charles Nye, architect, said he found that there had been a settlement, attributable to the excavation of the ground. There would not have been a settlement if the work had not been negligently done. Mr. A. Loader, architect, said the settlement was, in his opinion, caused by want of shoring and strutting in the trench. Witness considered the amount of the counter-claim very reasonable. His Honour gave judgment for the defendant, with costs.

WATER SUPPLY AND SANITARY MATTERS.

CLECKHEATON.—After negotiating for six years, the Cleckheaton local board have just effected an agreement with the Liversedge local board for the reception and purification of the Cleckheaton sewage at the Liversedge outfall works. The original annual payment claimed by Liversedge was £700, and their latest offer of £450 has been agreed upon. Liversedge will make a sewer at Moorbottom, and Cleckheaton will simply have to connect with the Liversedge drains and pay the annual sum of £450.

CONGRESS OF HYGIENE AT DUBLIN.—Under the auspices of the British Institute of Public Health a Congress of Hygiene was held on the 17th inst. at the Royal College of Surgeons of Ireland on St. Stephen's Green, Dublin. Sir Charles Cameron, President of the Institute, who occupied the chair, claimed for Dublin Corporation that there were few municipalities in the United Kingdom that had done better work or acted more liberally in carrying out sanitary reform, and expending money for that purpose during the last twenty years. During the last four alone they had expended a sum of a quarter of a million of money obtained on sanitary loans from the Treasury. The city was not naturally placed in a good sanitary position, and it was for the skill of the sanitary engineer to some extent to remedy this state of things. He believed that the death rate from typhoid in the city, in spite of the excellent water supply, was due to the sewage-saturated character of the soil. Papers on various infectious diseases and their origin were read by medical men, and the proceedings concluded with a dinner at the Spa Hotel, Lucan.

A new church is about to be built at Abergwynfi, diocese of Llandaff, to seat 500, from the designs of Messrs. Halliday and Anderson, architects, of Llandaff and Cardiff.

In the case of Frederick William Serff, late of Chiswick High-road, and Fulham Palace-road, Hammersmith, present residence unknown, builder, the discharge has been suspended for two years ending July 19, 1894.

The church of St. Donat's, diocese of Llandaff, is about to undergo careful reparation at an estimated cost of £1,000. The work will include repairing and reslating the roof of the chancel and Strading Chapel, now much decayed, and rendering the walls watertight. No structural alterations will be made to the building. It will be remembered that the St. Donat's 14th-century churchyard cross is said to be the most perfect in the United Kingdom. The work will be carried out under the superintendence of Messrs. Halliday and Anderson, architects, of Cardiff and Llandaff.

An inquest was held at Bromley, Kent, on Friday, on a carpenter named William Manwaring, in the employ of Mr. Soper, a Lewisham builder, who died in the Cottage Hospital from internal injuries, apparently received by the fall of a heavy sash while putting cords in the boxes. Evidence was given showing that deceased could easily have had more assistance had he asked for it, and a post mortem examination revealed the existence of an ulcer in the stomach, which accelerated death. The jury returned a verdict accordingly.

Our Office Table.

AN International Congress of Architects will be held at Chicago next summer, in connection with the Columbian Exhibition. Following on the lines of the Architects' Congress held at Paris in 1889, an advisory committee is to be selected from among the representative architects of all countries, including especially the presidents of professional societies. Mr. H. D. Burnham, of Chicago, is the chairman of the provisional committee for the forthcoming congress; and Mr. Robert C. McLean, of Room 19, Tribune Buildings, Chicago, is Secretary to the committee of arrangements, and to him all communications should be addressed. Among the subjects for discussion it may be expected that architectural education, examination, and registration will hold a prominent place.

THE lean exhibition at Birmingham Art Galleries this autumn will consist of works by living English animal painters. Mr. Whitworth Wallis, the energetic secretary of the gallery, has obtained fourteen of the principal works by Mr. Briton Riviere, R.A., seven or eight by Mr. H. W. B. Davis, R.A., and pictures by Messrs. J. T. Nettleship, John Charlton, A. C. Gow, R.A., S. E. Waller, J. C. Dollman, Burton Barber, Heywood Hardy, R. Beavis, J. S. Noble, R. Caton Woodville, Sidney Cooper, R.A., Basil Bradley, E. Douglas, Walter Hunt, R. Meyerheim, A. W. Strutt, and others, each artist being represented by four or five works. Mr. J. M. Swan will be represented by a series of studies, together with some of his bronzes. The exhibition, which will open in October, promises to equal in interest the David Cox Exhibition held in the same galleries in 1890, and the Pre-Raphaelite collection shown last year.

THE arrangements for the third annual congress of the National Registration of Plumbers, which is to be held in Dundee on 7th and 8th September, are now well forward. The Inverness District Committee will be represented by Provost Ross, Inverness; John A. Mackenzie, burgh surveyor, Inverness; Robert Black, C.E., Inverness; W. C. Joass, architect, Dingwall; Alexander D. Fraser, R.P., Inverness; Roderick Mackenzie, R.P., Dingwall; Daniel Walker, R.P., Inverness; A. J. Russell, R.P., Inverness; and Robert Reid, R.P., Dingwall. Friday, the 9th, will be devoted to pleasure. In the forenoon the strangers will visit the Technical Institute, and it has been arranged that in the afternoon they will leave Dundee on board the steamer *Forfarshire* for Perth, which place will be reached about four o'clock. The delegates will be received in the Town Hall by the Lord Provost and Magistrates, and thereafter will be entertained to tea by the Lord Provost in one of the hotels of the city. In the evening they will return to Dundee.

MR. W. H. M. ELLIS complains of the alterations which have recently been carried out in the parish church of Wiggenhall St. Mary, Norfolk, as he asserts, without a faculty being obtained. The church was, he reminds us, famous for its wood-work; the grand bench-ends in the nave still remain, but the chancel stalls have been carried away by the lay impropiator Mr. Bagge to Gaywood, and the famous screen, dated 1625, has also gone. All that remains in the chancel is the lower panels of the Mediaeval screen, which the present vicar saved. The famous sixteenth century lectern has also been moved. Some of the nave benches, of which there happily remain about thirty, nearly all different, and the rich south aisle screen, were illustrated in the *BUILDING NEWS* for Aug. 16 and 23, 1889, from measured drawings and sketches by Mr. E. Guy Dawber.

THE Merthyr School Board discussed at great length, on Friday last, a motion, stating, "That if tenders are advertised to be in the clerk's hands by a fixed date, no one connected with the Board is authorised to extend that time to any applicant, whether the meeting takes place at once or at any future date." It was admitted by members that the clerk had taken a tender after the specified time had elapsed, but before the other tenders were opened, and by this conduct it was contended that £150 of the ratepayers' money was saved. The clerk, it was explained, laid the matter before the Board before the tenders were gone into, and the Board agreed with what he

had done. It now transpired that the unsuccessful contractor had sent each of the members of the Board a letter calling attention to the circumstances of the case. Eventually the clerk was exonerated from all blame, but the motion was carried with only one dissident.

WE have seen a few very artistically executed specimens of parquetry at Messrs. C. Steinitz and Co.'s well-known London Parquetry Works, Camberwell Hall, S.E., where only hand labour is employed. One was for the floor of a bay window, from a design by Prof. Aitchison, R.A. The design of filling takes the form of a natural treatment of foliage, the stems and foliage being symmetrically disposed from a centre line or axis. Some very effective borders for floors are also on view, the inlaid woods being walnut in satin wood or sycamore. We also noticed a hall table in oak and butternut, of pleasing design; another of purple and olive wood. The centre parquetry panel on the floor of the South London Fine Art Gallery, executed by this firm, is a very bold and remarkable piece of work, the design of which was prepared by Mr. Walter Crane, and was illustrated by us April 24th, 1891. As a design this centre, 30ft. by 9ft., is bold and aquatic in character. The plant forms combined with shells are vigorously conventionalised, and the border of leaves and fish is very clever. The ground is of teak, and the pattern is executed or inlaid with shades of brown woods relieved by wainscot sycamore, canary satin and black woods. This fine design in parquetry was presented by Messrs. Chas. Steinitz and Co. to the gallery.

A BIG case turning on the validity of engineers' verbal orders is attracting attention among American contractors. Messrs. O'Brien and Clark, the contractors for section 6 of the new aqueduct which supplies the city of New York, recently sued the city for about 800,000dols. for extra work. The extra work, which was admittedly executed, seems to have been mainly done upon the verbal order of the engineer in charge. The Court in which the case was first tried gave judgment for the contractors for 20,000dols. The representatives of the city conceded that this amount was due, and stood ready to pay it, so that the decision was really a rejection of the contractors' claim. The contractors appealed, and the General Term has unanimously affirmed that of the Court below on the ground that the contract gave no authority to the engineer to order work in excess of the plans and specifications; as the President Judge Van Brunt put it, no liability to the city could ensue out of mere talk. It is still open to the contractors to carry their case to the Court of Appeal, but the ruling is so decided that it is doubtful whether the contest will be continued further, although it is understood that contractors for other sections of the aqueduct have similar claims, amounting in the aggregate to millions of dollars, the fate of which will be governed by this decision.

THE seventeenth annual report of the Public Works Loan Board states that the Commissioners, during the financial year 1891-92, made 494 advances for sums amounting together to £960,159, as against 481 advances for £990,068 in the previous year, showing an increase of 13 in the number of advances and a decrease of £29,909 in the amount advanced, as compared with 1890-91. Of this sum £9,000 was for providing dwellings for the working classes; £21,050 was for the purposes of the Harbours Act, 1861; £371,074 was lent to local authorities for sanitary purposes in England and Wales; and £26,128 for sanitary purposes in Scotland; £406,384 was lent to school boards in England and Wales; £115,123 to school boards in Scotland; and £9,000 for workhouses in England and Wales.

AN unexpected obstacle has arisen to bar, for a time at least, the carrying out of the municipal buildings scheme at Bath, for which Mr. J. M. Brydon's plans were, it will be remembered, recently selected in competition. In order to provide the necessary space for the extension, the closing up of an almost useless roadway called Boatstall-lane, with two approaches, one at the corner of the Market-place and the other from the Orange-grove, is needed. The city surveyor accordingly applied to two city justices for a certificate for the closing of the lane on the ground that it would be "more commodious to the public." The magistrates felt, however, that they could not give the certificate on these

grounds, as the substitution of one new road for two existing roads could not be termed "more commodious." When this became known to the public it caused much irritation, especially to those who had spent much time and trouble in furthering the progress of the scheme. On Saturday the magistrates reconsidered the question, and a *modus vivendi* was arranged, though it will require two applications, instead of one, to the court of quarter session. The justices agreed to give a certificate at once for the closing of the approach from High-street, and said that favourable consideration will be given to an application later on for a similar certificate in respect of the approach from Orange-grove. Fortunately this will not interfere with the progress of the preliminaries in the form of detailed plans and obtaining tenders.

THE sanitary committee of the Bradford Corporation have recently doubted the expediency of continuing to sanction plans for the extension of the present system of privies in that town. After correspondence with the officials of other large towns, the Corporation, on the recommendation of the committee, have issued a circular to architects and builders stating that they have determined to require in future that water-closets shall be provided for all new buildings, except where no suitable sewer is available for the drainage thereof, as they are now of opinion that privies, under the most favourable circumstances, are objectionable on sanitary grounds, in addition to the difficulty of disposing of the contents of privies without causing complaints of nuisance or inconvenience. Except where impracticable, it is enjoined that water-closets shall be provided in place of privies in all new plans submitted for approval. This is a step in the right direction.

AMONGST the new building materials which have found a place on the Continent is Xylolith, a German concrete compounded of sawdust and other materials not mentioned. It is supplied in plates or tiles of any size up to one square metre in area, and has the qualities of wood, but does not shrink. As a covering for treads and landings and floors, it is said to be valuable, being lighter than stone, not slippery, and wearing well. The steps resist abrasion better than those of oak. For hospital floors xylolith has been found of value as being non-conductive and impervious; the joints are few, and do not open, and therefore desirable where a sanitary surface is desired. The slabs have also been used for wall surfaces set in an iron framework, and are fire resisting. In Berlin it is used for the lining of theatres, and for decoration.

THE Administration Report for 1891-2 on the Railways in India shows continued progress, but not at the same rapid rate as in the previous year. During the twelvemonth, 65½ miles of new railway on the standard gauge were opened, and no less than 612½ miles on the metre gauge, making a total of 677½ miles, there being now 17,564 miles of railway open in India, as against 20,073 in the United Kingdom with an area of one-thirtieth. In 1890-1, 874½ miles were opened, of which nearly 58 per cent. was of the standard and 42 per cent. of the metre gauge, a dozen miles being of various irregular gauges. The differences of the gauges will probably be found to be an expensive item in railway management in the future, and it is to be regretted that two widths have been so largely adopted. At present there are 10,104 miles of standard gauge, 7,172 metre gauge, and 288 of special gauges. During the year sanction was given to the construction of 1,697 miles of additional lines, by far the heaviest undertaking being the Assam and Bengal Railway, 742½ miles in length.

AN interesting feature of the Arts and Industries Exhibition, to be opened on the 24th September at Barcelona, will be an international section of reproductions from the artistic industries of all ages prior to 1815. The rules provide that only one copy will be admitted of each reproduction except in the case of casts, of which two may be exhibited. Each reproduction must state the place where the original is to be seen, and any deviation from a strict imitation of the original must be clearly notified. The works will be judged by the jury of the general exhibition, and medals and certificates are promised. All works intended for this section must be delivered at the offices of the Secretary of the Exhibition, Paseo de Pujades, Barcelona, before the 1st proximo.

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXIII.—No. 1965.

FRIDAY, SEPTEMBER 2, 1892.

THE ARCHITECTURE OF ANGLES.

IN hardly any other position is architecture so expressive as it is at the angle of a building. The massive tower rising majestically at the angle of a large edifice—like the Victoria Tower does at Westminster—or the western towers of some fine cathedral—like those of Canterbury or Lincoln—appear in the mind's eye to gather up and concentrate all the power and expression of the building to emphasise the design. The central tower and dome may, indeed, be more powerful in captivating our imagination and awakening in us sentiments of pleasure, of mirthfulness, or of awe, according to their size and outline; but next to this position of dominating importance, the corner claims attention, and the corner is the position which the architect from time immemorial has generally chosen to display his skill and to concentrate attention. The angles of buildings are accentuated by projections, pavilion roofs, or towers—even by the carved angle-posts of old houses; the angles of a tower have their buttresses, pinnacles, or corbelled turrets, and this desire to mark the angle is particularly noticed in the castellated and domestic edifices of Scotland, where the small circular turret, with its conical-shaped termination, is almost invariably met with, and the form given to this feature varies from the simple angle-post to the richly-designed structures which adorn the chief corners of many of the hotels de ville of France, Belgium, and Germany.

The same significance is apparent if we transfer our remarks from the angle of a building to the corner of streets. In this position the angle has played a very important part in the architecture. Let us imagine a number of streets intersecting each other at angles without any attempt to mark the corners, numerous instances of which occur in London. Can anything be more meagre or unsightly? In cities like New York, Chicago, Brooklyn, where the rectangular system prevails, the monotony of the arrangement would be painfully felt, and the architects of those cities have wisely attempted to mitigate the abruptness of the angles by various means more or less satisfactory. The corner tower is a prevalent feature. In our own Metropolis, the junction of streets, especially when they converge as they do at Oxford-circus, at the junction of Tottenham Court-road and Oxford-street, at Cambridge-circus, and other busy centres of traffic, is becoming one of the problems for architects. Street alteration and extension have increased the number of awkward junctions, much to the bewilderment of visitors and strangers. As great centres of traffic, they ought at least to possess architectural emphasis. On the contrary, they are often hapless arrangements of intersected blocks cut into segments by the converging streets, squalid and undignified. The London County Council may relieve the supreme ugliness of these centres by doing something to prevent haphazard jumbles. Sometimes an elongated ellipse or octagon, or even an irregular polygon, may be more appropriate than the circular form of these circuses, as allowing the existing frontages or the new buildings at the corners to be set out with more architectural propriety. The corner buildings ought to be the main consideration in deciding upon the form of circus. What architectural treatment is possible in a building of the shape of a truncated wedge on plan, the truncated por-

tion being that facing the circus? It is this form of corner that is so difficult to manage, especially when sides and angles are alike unequal. The roofing presents considerable awkwardness. Take for example the recently constructed Cambridge-circus in Charing Cross-road. Here seven streets meet and intersect, forming unequal segments. The buildings are ambitious, but exceedingly awkward. Here was a splendid opportunity of forming a new circus worthy of the Metropolis; but, as generally happens, it has been lost. Commonplace buildings are erected round half the site, chiefly because no effort was made to arrange the intersecting lines. The New Opera House, with its flanking angle turrets, made a good beginning, and it may be asked why the other segments could not have been designed in some harmony with this structure. Between Charing Cross-road and West-street, a lofty block, known as Gloucester Mansions, has been erected, six stories in height, and occupied as shops, sitting, and bedrooms. As a design it is a fair specimen of what may be called the "Investment-in-Commercial-Premises style," an ambitious front with dormers and pavilion roofs, in which all the effort has been expended in the front elevation towards the Circus. There are three or four such blocks of buildings erected the corners of which have turrets and oriels. The block of shops, sitting, and bedrooms appears to be the class of building which "takes" in these centres; but here was a good opportunity presented for the erection of public edifices, suites of offices, and the like. Even in so irregular a junction of streets some attempt to connect the elevations of the main corners would have been more satisfactory if the corner angle turrets, corbelled out and crowned by small cupolas of the Opera House and the octagonal corner of the City Bank, had been repeated at the opposite side of the circus. In these positions the corner plays a great part: it really forms the termination between two converging streets. A little further northwards is seen another red brick block of flats, the Halberstadt Mansions, with a huge stepped and scrolled gable towards the street relieved by octagon-shaped engaged pinnacles corbelled out. The corner is canted, and in the gable there are six stories above the shop. The style is Flemish Renaissance, and the building agreeably breaks the monotony of the long street. The "Trentishoe" Mansions have the corner turned as an octagonal turret, finished with a conical roof and lantern. Near the Oxford-street end is another large red brick and stone block of offices nearly completed, the angles of which have simply three-quarter circular turrets corbelled out of the canted sides. Again, at the junction of this road and Cranburn-street a corner turret oriel of stone is made to spring from a column.

Another instance of what has been lost in the picturesqueness of our new streets is the junction of Endell-street and Shaftesbury-avenue. The awkward joining of the Avenue with Broad-street is very unfortunate. A red-brick and stone row of gabled mansions have been built on the north side of Broad-street, and a little further northwards in the Avenue is a block of offices and chambers, which forms an acute angle with Dyott-street. This angle has a circular oriel, finished below the main story and capped by a roof, but kept so low that it does not emphasise the angle. Here was a good opportunity of making a feature of two new corner blocks where the street was wide and the view from Endell-street uninterrupted. A corner building may become a prominent protruding feature in a long line of street, as that which bifurcates Oxford-street and Hart-street, where a tower-like composition is called for.

The mode of treating the corner may be discussed, and would form an interesting subject if we dealt with the many varieties

that meet us in Continental cities, in this country, and in America. The circular and the canted forms are positively ugly and commonplace, as the builder is apt to give them to us, in the ordinary type of public-house rounded corner, with its doorway illustrating the problem of a circle on circle, and its everlasting brewers' sign over, and it is extraordinary that for many years this hideous and intractable form has continued. In France and Germany the projecting circular corner, as we find in the Chateau de Chambord, and many other examples of domestic architecture, the square pavilions, as we see at the angles of the Louvre, are features separately roofed from the main structure, imparting a piquancy or grandeur to the mass. The old French and German and Flemish cities are rich in their variety of angle architecture. At Rouen, Lisieux, Freiburg, Hildesheim, Frankfurt, and other places we find the angle oriel or turret of one or several stories projecting from the corners of buildings. At Wurzburg the well known Bishop's House affords a notable example of the ornamental angle turret, and at Boppard and other towns on the Rhine the same may be seen. The pencil of Mr. Callow has made us familiar with many instances of this picturesque addition to German Renaissance buildings. The conical roof nearly always crowns the corner oriel. In London the architect is compelled to restrict his projections even at the corner, and so when he designs a feature of this kind he has to keep it within the lines of his main front, except when it springs above the lower story. Mr. Waterhouse's angle tower to the National Liberal Club House in Northumberland-avenue, is a good modern instance of how an acute corner may be treated. For ordinary buildings, the canted corner may have a circular or polygonal-shaped oriel corbelled out above the first floor, and such a treatment may be seen in many of the new buildings in the West End. The corbelled window jutting out from a canted corner may be noticed in Mr. Belcher's new Institute of Chartered Accountants in Broad-street, and in other recent buildings. But in the larger number of buildings the corner cant is narrow, and the feature is dwindled in size. At the corner of main streets we need a bolder splay or a larger circular corner. The small turret carried up as a cupola or otherwise, such as we see in Oxford-street, and in some places in the City, is paltry, and can only suggest ridiculous comparisons. Whether as angles architecturally treated in this manner, or as whole buildings, the corner deserves more study in the reconstruction of our streets, squares, and circuses. What the picturesque corner combinations might have done to improve such centres of traffic as Piccadilly-circus, Oxford-circus, Ludgate-circus, Charing Cross, can only be realised by the artistic mind. The bold quadrant, accentuated by massive pavilions or towers, is a composition scarcely known in London; and until we adopt a more liberal scale in the planning of our thoroughfares and centres, our attempts in this direction will be puerile, or will be mainly dependent on private enterprise.

THE SANITARY CONDITION OF OUR TOWNS.

WHEN so unwelcome a visitor as cholera is near our doors, it is time to set our houses "in order," at least so far as to inquire into their sanitary condition. Even the "scare" of some pestilential epidemic is at any rate beneficial in awaking us out of our dream of security. So radical and important have been the changes in the condition of the Metropolis and our larger towns since the last visitation, that it may be thought we are full abreast of our foe, but

it appears from recent reports made by the *Lancet* Commission, that our supposed immunity is not so well assured as we imagined, that our houses are not so impregnable to attacks as we thought they were. The *Lancet* Commission points out what are the essential conditions which should be fulfilled before the drainage of any house can be passed as satisfactory. These are briefly that, as far as possible, drainage should be outside the house. The soil-pipe should pass directly from the closet-trap through the wall and down the outside of the house to the drain; the latter should be of glazed stoneware or iron pipes, 6in. diameter; where they pass underneath the house they should be encased in concrete, the fall not less than 1 in 50ft.; that between the house and sewer there should be a manhole or disconnecting chamber, with channel pipes from all the closets and wastes; that the drain should be ventilated; that rain-water pipes should be disconnected, and discharge into open gullies, &c. These are the main essentials, with which our readers are already conversant. That the condition of a very large percentage of the houses in the country is by no means up to this standard cannot be disputed.

The report, at any rate, makes it very clear that landlords, those who own and let houses, are often totally indifferent to the subject of drainage; many of them from simple ignorance, others from commercial motives. The general public are equally indifferent or ignorant. The process of inquiry adopted was most thorough, as it was intended to go to the root of the matter. To 1,000 house agents and surveyors who let houses in different parts of the country, the appeal for information has been made, and the answers received have undoubtedly established the fact that the public have under the present system of letting and taking houses no security whatever. The tenant signs the lease or agreement of a house without knowing really the actual condition of the drainage or water supply; he makes no inquiry as to the drains, whether they leak or are faulty, whether they are cut off from the sewer or ventilated, or how they are jointed. The tenant, as a rule, has to do with the agent in the first instance, and the agent is instructed by his employer, who, of course, is not willing to disclose, even if he knew anything in the sanitary condition of the premises was wrong, any fault to the tenant. Is it at all likely? And is it much more likely that the agent, who is anxious to obtain his commission for letting the property, should *desire* to know, or wish to disclose, anything detrimental to the letting of the said property? House agents can scarcely be regarded as independent agents in many cases, so that the information that has been gathered is certainly of the most disinterested kind. The Commission reports that the prevailing opinion amongst their correspondents is very decidedly that "the amount of information placed at their (the agents') disposal by landlords for the benefit of proposing tenants is quite insufficient to enable them to give an accurate and trustworthy opinion of the houses they are asked to let or sell." Precisely so. Some of the agents regard the silence of the landlords as due to ignorance, and not to the wilful suppression of defects. Very possible; but do the agents ask for special details as to drainage? Is it their duty or business to do so? Certainly not. One or two are honest enough to describe the consequence of such inquiry. Supposing a house-agent did inquire, is it likely the landlord would give information as to any defects? We opine not. Are we to suppose that landlords are more trustworthy than some other vendors of property? Of course, there are landlords of high character who would scorn to place their own pockets before their responsibilities, but we are afraid to say how many. Happily, the

local sanitary authorities discover the defects for themselves, and protect those who are too ignorant or indifferent. In such towns as Eastbourne, Brighton, and Hastings houses are inspected, and those not above suspicion are soon condemned, rendering it almost impossible for a landlord to derive any advantage from ignoring defects.

Various suggestions have been made to meet the evil, such as that there should be a plan of the drainage in every house to be let, that a builder's certificate should be produced, that local authority should make periodical inspections of all houses and grant certificates with date of last inspection, that the authority should advise what alterations should be carried out, that the authority should preserve the "sanitary history" of every house, that the tenant should have an inspection of the drains made, the fee to be paid by the tenant. Many of these have been made before.

We are strongly of opinion that the local authority should obtain the information and grant certificates of good drainage, and should, in fact, take the sanitary efficiency of every dwelling in their own hands, the only way of doing which would be to make periodical inspections and records of every house when vacated. These inspections, if but optional on payment of a fee, would only benefit the few that wished them. Of one thing we are sure, reform will not come, and it never has come, from the interested party—the landlord or vendor. Nor has our knowledge of transactions with house agents given us much hope that amendment may be looked for from this quarter, as the house agent is bound to serve his client, and, therefore, it seems absurd to expect that the agent will furnish the inquiring tenant with a full and trustworthy account of such a matter as drainage, or be the right person to make a professional report for him. Many are the reasons which are given for objecting to the agent acting as a surveyor for the client. Amendment must come from those about to take the house. The tenant must either be educated in the essentials of a sanitary house or be protected by law. The Sanitary Registration of Buildings Act, introduced during the late Parliament, was a movement in the right direction, but vested interests are too strong to enable a measure of the kind to be carried. That a local authority should inspect every dwelling-house when vacated, and see to its being put in sanitary order, is the only means left of preventing the letting of insanitary houses to unwary tenants, and the plan adopted at Eastbourne, by which the local authority grants a certificate to a landlord if his house is equal to the standard of requirements, is one that commends itself. The plan of registration by this means is a good one, and if it is a voluntary act on the part of the landlord, no one can find fault, and the certificated houses so registered are sure of being let. Certificates granted by those interested in the house, whether as builders, agents and landlords, or even as sanitary experts, are open to suspicion. Compulsory registration ought to be undertaken for all seaside hotels, boarding-houses, and lodging-houses, as we have before suggested, and we think that clauses of the Housing of the Working Classes Act may be usefully applied to all houses in our towns.

THEATRES.—VI.

By ERNEST A. E. WOODROW, A.R.I.B.A.

MOST writers on the subject of theatres dwell fully upon the excellence of the Greek and Roman amphitheatre. The conditions, however, under which these buildings were erected were so widely different to those of the modern English theatre, that beyond the interesting study of the subject there is little to be

gathered from the form of these buildings that will be of service to the student of theatre planning of the present day. "It has been asked," says Saunders, "why have we not in our theatres made choice of the same form as the ancients? And the answer has uniformly been, because our manners differ from the ancients, because in adopting the semicircle we should be obliged to leave too great an opening for the stage. Allowing these objections their due weight, we may add that theatres had their rise in Greece, and from Greece the Romans no doubt took the model for their own country; their climate required a spacious open area, as the performances were conducted during the heat of the day before a people unaccustomed to any inclosure that shut out the open air. . . ."

I touched briefly in the last article upon the acoustics of a theatre; the sighting of the auditorium is so closely associated with this, that it would have been well, had space permitted, to have dealt with the two subjects under the same chapter. It may be taken as a broad axiom that where the spectator can conveniently see all the facial expressions of the actor, he will hear with ease the words spoken or sung by the actor; where a member of the audience has to twist his body round and crane his neck to obtain a view of the performer, he will experience a difficulty in following the action of the play, as well as suffer acute physical fatigue.

"The phenomena of light and vision," says Professor Roger Smith, "closely resemble those of sound and hearing, and the two mutually illustrate one another." Where there is an obstruction to sight there will be obstruction to sound, though not always to the same extent. "In every building intended for public purposes, provision should be made that each person shall receive a direct and uninterrupted ray of sound, and shall have an equally uninterrupted sight of the speaker."

I may appear to dwell upon this truism at too great a length; but how many visitors to our theatres have experienced the annoyance of paying for a seat, from which a view of the performance could only be obtained by bodily inconvenience? Many, I fear. I have heard it related of one manager who refused to allow his box-office keeper to sell certain side seats in a provincial theatre, he looking upon it as robbery of the public, to let them seats from which they could neither see nor hear.

I have been impressed with the remarks Mr. Buckle makes on this subject in his work, to which I have already referred more than once. "To the professional reader," he says, "it will appear a reflection on his intelligence to suggest that in buildings intended for the reception of the public the lines of the interior should be so designed that each person may receive a direct and uninterrupted ray of sound, and an uninterrupted sight of the speakers. For the lay reader who visits a theatre—designed on the most approved principles—to find that there are seats from which only two-thirds of the stage can be seen, the other third being cut off by a vertical line formed by the private boxes, the possible perfection of sighting will awaken a sense of prospective pleasure. This is both possible and practicable, and its acquisition merely demands a careful adjustment of the 'lines' of the interior and the solution of minor constructive problems."

Since these words were written, but a few years ago, several new theatres have been built in London, and it is a matter of congratulation to the profession that, at any rate in the modern London playhouses, this evil is becoming conspicuous by its absence. "Past failures," the same writer continues, "in respect to sighting are largely attributable to the designers having failed to realise that the conditions contributing to perfection of sighting in a church or lecture-hall, where the speakers are stationary, are not compatible with the exigencies in a theatre, where the speakers are continually changing their positions. In the former case the sighting is to one single point, while in the latter it must be equally good to a series of points extending along a line parallel with the spectator, and some 20ft. or 30ft. long, according to the width of the proscenium opening." In a former chapter (No. IV.), it will be remembered, I explained how the width of the proscenium opening governed the whole design of the plan of the theatre.

The method of setting up a section of a theatre so as to obtain a perfect view of the stage for each spectator has been described by many

writers, and is so clearly put forth by some of them, that I cannot do better than refer my readers to the works of Professor Roger Smith, Mr. Tarver, and Mr. Buckle for further study of the subject. Scott Russell, in an article which appeared in the *Edinburgh New Philosophical Journal* for 1839, published a description of the mode of setting out the seating for a large public building, such as a lecture theatre. Later M. Lachéz very fully developed the same method, adapting it to the theatre for the drama in his work, "Acoustique et Optique." The position and height of the speaker on the platform, and of the auditors occupying the first seat being determined, a line is to be drawn from the speaker's mouth, touching the point where the top of the first auditor's head would come, and at the proper distance—say, for example, at 2ft. 6in. back—the situation for the second auditor is to be marked, and on the line indicating the back of it a height of 1ft. 6in. or less is to be set off upwards from the point where the ray from the speaker's mouth touched; this is to mark the position of the top of the head of the second auditor.

By repeating this process, setting up 18 in. at each seat, a series of points are found all ranged in a curve, which is called the "isaccoustic" curve, or equally hearing curve. Each seat will be placed about 2ft. 9 in. below the mark indicating the top of the head of its occupant, and the floor on which each stands should be about 1ft. 6 in. still lower. This description, with the accompanying diagram, borrowed from Mr. Smith's work, explains the principle of the

FIG. 1.

isaoustic curve as adapted to any hall, lecture theatre, or public building.

Speaking specially of theatres, it has been said that as a theatre is, as the word implies, a building to see in, the first consideration is that every one shall see the actors comfortably over the heads of those in front of him. "It will be sufficient," writes Mr. Tarver, "if every one can see over the head of the person in front of him the knee of an actor 10ft. back from the front of the stage; he will then see his feet over the shoulders of those in front of him. I have tested this," the same writer continues, "in various parts of London theatres, and found it quite a sufficient line of sight."

The seats should be arranged so as not to be immediately one behind the other, but placed to allow the occupants to look over the shoulders, and not over the heads of those in the row immediately in front. There is no difficulty in making this arrangement in the circles where the gangways and seats radiate, and the number of seats in a row increase as they retreat from the stage. In the stalls and pit, where the gangways are in a straight line, and the number of seats the same between the gangways in each row, there must of necessity be a loss of seats or reduction of the width of the gangway in order to obtain this arrangement; but where the stalls are placed in curved lines facing the stage, as at the Royal English Opera House, the same arrangement may be adopted.

The following method will explain the process of setting up a section of a dramatic theatre on the principles advocated by M. Lachéz, which is on the same lines as that already described above. Having decided the height of the stage above the floor of the front row of stalls, and the width of each row of the stalls, set up the top of a man's head at 4ft. 6in. in the front row, draw a line over it to the eye of the man behind in the second row. This will be 4ft. 2in. above the floor of the second row; the top of the head will be 4in. higher, making 4ft. 6in., as before. From this point draw a line to the eye of the man behind, in the third row, and repeat the same course for every row. If this system were adopted in

practice, the isacoustic curve would be determined by the width given to each row, and would, therefore, be steeper in the pit than in the stalls; but, as I shall explain, a modified form of the principle is carried out in actual work, for, were this system followed to the letter, as the accompanying diagram shows (Fig. 3), the pit floor would be far too steep for practical theatre building; and it is self-evident that the tiers over the pit would have to be raised in proportion to the head-room obtained, thus necessitating an auditorium of excessive height, out of all proportion.

Mr. Buckle describes what is perhaps the most usual method adopted by architects to find the rake of the seating, as follows:—"Having settled on the sectional drawing the position of the floor of the first row in the dress circle, a point should be fixed 3ft. 6in. to 4ft. below the stage floor at the front, or point nearest the spectators, and from this point an extended line touching the nosing of the first stepping. To this line the nosings of the other steppings should be tangent. Having fixed the position of the first row in the second circle, a line should be drawn from the point below the stage floor, as above described. To this line the nosings of the steppings should be tangent. This method is also applicable to the gallery."

In the accompanying diagram, the dress circle is sighted to a point on the orchestra floor, and the second circle and gallery to a point 3ft. 6in. below the stage.

Where the seats are arranged as shown in Fig. 2 it is evident that the line of sight is over

FIG. 2.

the shoulders, and not over the heads, of the occupants of the seats in the row immediately in front.

The rule of the London County Council with regard to the space to be allotted to each person is that the drawings deposited at the Council's office for the consideration and approval of the Council shall show the respective numbers of persons to be accommodated in the various parts of such premises, and the area to be assigned to each person, which shall not be less than 1ft. 8in. by 1ft. 6in. in the gallery, and not less than 2ft. 4in. by 1ft. 8in. in other parts of such premises. Roughly speaking, the width usually allowed for the pit is from 2ft. 2in. to 2ft. 4in.; for the stalls about 3ft., or rather more in some houses; for the dress circle 3ft.; for the upper circle, 2ft. 6in. to 2ft. 8in.; and the gallery 2ft. to 2ft. 3in.

After setting out the pit and stalls, the distance from the stage of the first row of the dress circle must be determined, and the height fixed of the soffits above the pit floor so as to allow comfortable head-room to the pittites, and to

FIG. 3.

permit them standing on the seats when passing out. The eighth regulation of the London County Council forbids this height being insufficient, and "resulting in discomfort, semi-suffocation, and depression arising from the audience having a ceiling within a few inches of their heads," for it provides that where the first tier or balcony extends over the pit, stalls, or area, the height between the floor of the pit and the first tier shall not be at any part less than 10ft. The width of the rows of the dress circle will determine the sight lines, as in the case of the pit and stalls.

The upper circle front should be set back farther from the stage than the dress circle, so as to allow a portion of the latter to project into the auditorium, without an overhanging ceiling to obstruct sound and sight. The soffit of the front

row of the second circle should not be less than 8ft. from the stepping which it immediately overhangs. The line of sight of the second circle is found in the same way; but, of course, the gradient will become steeper and the width of the rows narrower, in accordance with the details already given.

The front of the gallery should be kept back from the stage, for similar reasons to that of the second circle, for then the second circle has plenty of air space above it, and the gradient of the steppings to the gallery is less steep than if its front were nearer the stage.

The height between the gallery floor and the ceiling is determined by the Council's rule that the height between the floor of the highest part of the gallery and the lowest part of the ceiling over the same shall not be less than 12ft.

For the guidance of some of my readers, I give some examples of the dimensions adopted from the curtain-line to the box-fronts of the dress circle, upper circle, and gallery of a few of the medium-sized London theatres. From curtain-line to front of—

	Dress Circle.	Upper Circle.	Gallery.
Savoy	34 6	43 10	48 6
Gaiety	36 0	45 0	47 6
Terry's	29 0	31 0
Novelty	30 0	31 0	33 0
Sadler's Wells	41 0	46 0
Prince of Wales	34 6	40 6	44 2
New Theatre, Cran-			
bourne-street	34 6	39 0	45 0
Shaftesbury	35 0	40 8	44 0
Lyric	38 8	44 9	48 3
Strand	31 9	nil.	39 6

Now to return to the isacoustic curves. The degree of steepness of the rake of the seats will, it will be seen from the above, vary with circumstances, such as whether it is necessary for the audience to look up from the stalls or down from the gallery; the more space that can be allowed from front to back, the less inclination will be requisite. When the audience are much below the stage, the true isacoustic curve will dip down slightly at its commencement; but under such circumstances a flat floor will answer all practical purposes.

All the foregoing strictly refers to seats in the centre of the house. I fear it is usual with some

FIG. 4.

architects to be content if they obtain a good sight-line for their centre seats, and to leave the side seats to chance. The farther the seats are away from the centre the more difficult is it to obtain a good sight-line for them. It is, therefore, as well to keep all seats on plan on as flat a curve as possible, so as to face the stage, instead of being placed sideways to it; but of the lines of front I shall have to speak more fully in my next chapter. I think the difficulty of sighting the side seats would have been frequently overcome had the designers been willing to test their lines of sight by more than the one section—*i.e.*, the longitudinal section. When other test sections are set up on radiating lines from the seats to the stage, then it is found that the steepings of the seats at the sides should be steeper than those in the centre.

To overcome some of this difference, the first, and sometimes first and second rows of the circle drop towards the proscenium, and the upper rows rise by gentle curves from the centre. This method, it will be remembered, was carried out with great care in Mr. D'Oyly Carte's New English Opera House. It is quite possible to determine on plans and sections the exact position of each individual seat in the auditorium, and its exact

GRAND ENTRANCE TO SHWAY DAGOHN PAGODA, RANGOON.

Eight above a given datum line. Those of my readers who saw the drawings of Mr. Carte's theatre, which were exhibited at the Association, will remember that the height of every seat from a datum line was figured in the working drawings. More especially is this necessary where the cantilever construction is adopted, as the exact rake of each radiating cantilever must be determined; it cannot be left to rule of thumb to pack up or lower the seating after the girders are in. The detail drawings of the sighting of a theatre must be accurate to within a quarter of an inch; the slightest defect in the front row will be increased in the second and augmented in each successive row, and still further emphasised in the tiers above.

A theatre with seats too high and too steep is almost as bad as one in which there are seats from which but a partial view of the stage can be obtained, for in the former the rake of the gallery must become so steep as to render it a trial to the nerves to sit there without being overcome with a feeling that one will fall headlong into the pit below.

A SANITARY CRUSADE THROUGH THE EAST AND AUSTRALASIA.

MR. ROBERT BOYLE has just completed another of his famous sanitary crusades round the world, this being the fourth time he has circled the globe in the interests of sanitary science and of the well-known ventilating and sanitary appliances which he is the inventor of, and which are manufactured by Messrs. Robert Boyle and Son, Limited, of London and Glasgow.

Two years ago we gave an account in these columns of Mr. Boyle's third tour round the world, when he travelled through Egypt, India, China, Japan, United States, and Canada, and last year an account of his tour through South Africa, in both of which he was highly successful in stimulating an interest in sanitary matters, and securing the adoption of his systems of ventilation and sanitation. Mr. Boyle seems to have been no less successful throughout the tour just concluded, in the course of which he visited Burmah, the Malay native States, Sumatra, Siam, Borneo, Java, Australia, New Zealand, Samoa, the Sandwich Islands, and America, where he surveyed the different buildings comprising the Chicago Exhibition, and furnished plans and estimates for the ventilation. Mr. Boyle, who has visited most of the great exhibitions held in different parts of the world during the last twenty-five years, is of opinion that the Chicago Exhibition Buildings are not only the largest he has ever seen, but architecturally the finest, being in both respects a great advance on the last Paris Exhibition; whilst the grouping

of the buildings and general arrangement of the grounds are a wonderful display of skill and ingenuity, which reflect great credit on the architect-in-chief, Mr. D. H. Burnham, of Chicago, who is also the architect of the Arts Building, a superb Classic structure which is intended to be permanent. We many mention *en passant* that the South African Exhibition at Kimberley is ventilated throughout with Mr. Boyle's system.

Agencies have been established in the different countries visited, and arrangements completed in each of the Australian Colonies and New Zealand for the manufacture of the latest improved form of the self-acting air-pump ventilator and other ventilating and sanitary appliances. As evidence of the confidence of the agents appointed in Australia with regard to sanitary prospects in the Colonies, we are informed that they have undertaken to sell within a specified time not less than £16,000 worth of air-pump ventilators, &c., representing ventilating contracts to the value of about £40,000; but at least double that amount of business is confidently expected to be realised.

Burmah was the first country visited by Mr. Boyle, which, though twice the size of the British Isles, is very sparsely populated, the total population not exceeding seven millions. The Chinese hold the bulk of the business of the country in their hands, and are evidently destined to overrun the whole of Burmah to the exclusion of the Burmese, who, though a fine people, are a happy-go-lucky, careless race, very correctly described as "the Irish of the East." Rangoon, the present seat of Government, and which has a population of about 200,000, is a very poor-looking city, the public buildings, what there are of them, and other erections—they can hardly be called houses—having an exceedingly dilapidated and decayed appearance, which is quite depressing; whilst the streets, which are wholly destitute of pavements or sidewalks of any kind, are ankle-deep in dust in dry weather and seas of mud in the rainy season. There seems to be an absence of public spirit amongst the European residents of Rangoon, which is quite exceptional in English communities in the East, and to this may be to a certain extent attributed the prevalence of small-pox, cholera, and other malignant diseases, which are periodically epidemic and never abate.

Europeans frequently suffer from what is known as the "Dhoba (washerman) itch," which is contracted through body-linen, &c., being washed in still water along with the dirty clothes of the natives, many of whom suffer from loathsome diseases, such as leprosy, scrofula, &c. The "washing" is usually "done up" in the filthy hovels of the natives, where further opportunities are afforded for the acquisition of disease-germs and other objectionable and animate matter,

which it is unnecessary to more particularly specify. Dhoba itch is simply blood poisoning, which manifests itself in various disagreeable forms, such as a kind of ringworm, and is very difficult to get rid of.

The street corners of the principal thoroughfares in Rangoon are usually ornamented with animated monuments in the form of leper-beggars, especially at night time, when special facilities are afforded the unwary wayfarer to fall over them, as the streets are then in almost total darkness, the public lighting consisting of a few miserable oil-lamps placed at remote distances from each other, and as often as not left unlighted. In the early morning the town is usually enveloped in a dense white fog or mist, which penetrates into the houses and saturates everything. This is the cause of severe chills being contracted, and indeed there seem to be thousands of people afflicted with the most violent coughs, the sound of which constantly greets the ear all over the town day and night. Funeral processions are one of the commonest sights in the streets, and the public gharries or cabs are commonly used for the conveyance of small-pox, cholera, and other patients; whilst the principal street-corners are about equally divided between Chinese grog-shops and medical halls, these being the largest and most thriving places of business in the town.

Insect life puts itself strongly in evidence, and wherever there is a light to attract them, the floor, or more often the dinner-table, is soon covered with carcasses of thousands of different varieties of moths and flies, which fall down on the top of one very much in the form of a shower bath. Some of these insects are of great size, one, a green moth, measuring 12in. across the wings. These, along with mosquitos, mammoth spiders, cockroaches as large as rats, centipedes, lizards, and snakes, with which most houses are infested, combine to make home life in Burmah rather more lively than agreeable.

The steps of the great Shway Dago Pagoda, the Mecca of the Indo-Chinese Buddhist, one of the most wonderful temples in the world, are closely lined from top to bottom with lepers, suffering from that loathsome disease in its worst forms and most advanced stages. A number of the poor victims whom Mr. Boyle examined were found to be half eaten away, and presented a most sickening and awful spectacle, whilst others afflicted with the most horrid diseases were simply one mass of putrid sores of a greenish colour, from which exhaled a fearful stench. Mr. Boyle, who has made a special study of leprosy in the East and Africa, states that he has nowhere else seen the disease in such terrible and ghastly forms, or where so little was done for the alleviation of the sufferings of the wretched victims or the pre-

TEMPLE AT THE SHWAY DAGOHN PAGODA, RANGOON.

vention of the propagation of the disease. As it is now generally admitted by the medical profession that leprosy is contagious, nothing else could be expected but that the disease should be rampant in the country, when in the very places where the people congregate in dense masses, during the festivals there being sometimes as many as 50,000 pilgrims present, this sort of thing is allowed to exist, and that, too, with the direct sanction of the authorities, who have made no provision whatever worthy of the name for the cure or treatment of these poor lepers, who are thus compelled to resort to begging to keep themselves in existence. Such a state of things in a British possession is a public scandal and a disgrace to those who are responsible for it.

The water-supply of Rangoon, which is brought from a lake in the hills, is fortunately good, and a system of drainage has been introduced after years of opposition to the scheme, consisting of 6in. pipes with pneumatic ejectors, which will, when complete, prove of great value to the town; but at present the ventilation is very defective, and the supplementary drains or gutters for carrying off the surface water should be covered over to prevent the natives using them as they do at present as common sewers. When the whole of the main drainage was completed, it was discovered that it had been omitted to make it compulsory on the inhabitants to connect their houses with the drains, and the whole question

had to be fought over again before the necessary by-law was passed, which has only just been done. It is proposed to build a Jubilee Hall in Rangoon, the plans for which have been prepared, the Boyle system being specified for the ventilation; but as the amount required is not yet fully subscribed, it may be some time yet before it is erected.

Mr. Boyle proceeded to Mandalay, a railway journey of 380 miles, where he found the sanitary condition of the city fairly good, though there is no system of drainage of any kind, the excreta being collected and thrown into the river. The dogs and pigs with which the streets are infested form most efficient scavengers, and it is certainly a cleaner and healthier town than Rangoon.

The ex-King Theebaw's Palace, which is situated in a walled inclosure one-and-a-half miles square, consists of some very fine examples of Burmese architecture and wood-carving, lavishly covered with gold leaf, as are also most of the pagodas in Mandalay, which compare favourably with the finest temples in Japan. Unfortunately, the great fire which destroyed four-fifths of Mandalay since Mr. Boyle's visit, consumed many of these buildings, including the palace, which is a decided loss to art.

The great Arakan pagoda at Mandalay, in which is enshrined the famous brass Gautama, is one of the sights of the world, and if visited during high festival, as seen by Mr. Boyle, when

pilgrims are assembled from all parts of the country, it is a sight never to be forgotten, and unequalled as a gorgeous spectacle of Eastern display. Here, as at Rangoon, the lepers are present in hundreds, and they so crowd the entrances that you have to carefully pick your way through them on entering and leaving the pagoda.

The "incomparable" pagoda is a remarkable building of vast size and of peculiar construction, but it would take volumes to describe even the principal temples in Burmah, which is dotted from one end to the other with them, many of them of great beauty. There are said to be over 30,000 Pohngyees or Buddhist monks in Mandalay who, as Buddhism, which numbers over 400,000,000 adherents, is merely a very pronounced form of Atheism, and acknowledges no Supreme Deity, act as teachers and moral examples to the people, which are the sole functions of a Buddhist priest. Pagan, an ancient capital of Burmah, situated on the Irrawaddy between Mandalay and Rangoon, is said to contain over 10,000 temples of various sizes and styles of architecture, covering 16 square miles. Mr. Boyle states that, as seen from the river, it is one of the grandest and most-impressive sights he has ever beheld.

Lower down the Irrawaddy, below Prome, there is a large cliff, about two miles long and 300ft. high, in the face of which, carved out of the rock, are innumerable figures of Buddha ranged in tiers from the bottom to the top the whole length of the cliff. Mr. Boyle computed that some of the figures were not less than 20ft. in height, many of them being richly gilded, the whole forming a very brilliant and curious sight. A few miles up the Irrawaddy from Mandalay is situated the Minjohn pagoda, a high mass of brickwork 400ft. square at the base, and originally intended to rise to a height of about 500ft.; but during the course of construction it was struck with lightning, and never completed. As it stands it is the largest brickwork structure in the world. Close beside it is the second largest bell in the world, being next in size to the great bell in Moscow. It measures 18ft. in height, 11ft. is 17ft. diameter at the widest part, the metal being 18in. thick, and weighs close on 100 tons. In the province of Pegu there is a recumbent figure of Buddha, supposed to be the largest figure in the world. It is said to measure about 270ft. in length by 70ft. at the shoulders. There is also a very curiously-balanced rock, on the top of which is erected a temple, but how it retains its position seems almost a miracle.

When Mr. Boyle visited Penang two years ago he found the sanitary arrangements in a very defective state, but steps are now being taken to improve the drainage of the town, £3,000 having been voted by the authorities for that purpose. The water supply, which is of good quality, is also to be added to. A city engineer has recently been appointed who will doubtless effect further improvements in this direction. Malacca is a well-arranged and remarkably clean town, and is considered a healthy place. The ruins of the Jesuit cathedral, where St. Frances Xavier laboured and died, are very interesting. It is strongly built of lava blocks, the interior being of Italian design. There are some finely-carved tombstones in the church, dating from the 16th century.

Mr. Boyle was very favourably impressed with Kwala Lumpur, the capital of the native state of Selangor. The Sultan, though a very old man, is most enterprising and public spirited, spending the bulk of his revenue in developing and improving his territory. The sanitary arrangements of Kwala Lumpur have received careful attention, and there is a good water supply. The European and native hospitals, which are constructed according to the latest and most improved designs, are models of cleanliness and order, and excellently managed. Owing to the dense jungles and swamps, malarial fever is very prevalent all over the country, and especially so at Klang, the port of Selangor connected with Kwala Lumpur, twenty-three miles distant, by rail.

In Pahang, the adjoining native state, Mr. Boyle found a rebellion in full swing, and the country in a very unsettled state, owing to the massacres that were being perpetrated. Travelling through the jungle even with an escort was both difficult and unsafe—a very different state of affairs to that at Johore, where all was peace and prosperity, the Sultan, to whom Mr. Boyle had letters of introduction, being one of the most enlightened potentates in the East.

Acheen, in Sumatra, is a very unhealthy place, and the sanitary arrangements are most defective. The Dutch colonists, unlike their countrymen in Java, seem to be quite indifferent to everything not immediately connected with their own personal interests, and the public health suffers accordingly. A war has been in progress since 1873 between the Dutch and the Sultan of Acheen, and which seems likely to continue for many years to come. This, of course, has a prejudicial effect on the progress of the country, and greatly retards its development. Delhi, further down the coast of Sumatra, is also an exceedingly unhealthy place. It and Acheen may be considered the two most unhealthy places in the East, the malaria which arises from the mangrove swamps being of a deadly character.

The sanitary condition of Singapore has been considerably improved since Mr. Boyle's previous visit, and it is now a fairly healthy place to live in. An unlimited supply of good water has been provided, which has greatly contributed to the health of the inhabitants.

THE GUILDHALL.

THE London County Council are now considering the advisability of erecting a palatial Hotel de Ville, in which to carry on its official work. Whatever may be the result of their deliberations, and no matter what kind of magnificent building may be erected, it will never be able to compete with ancient Guildhall, the home of the Corporation of London, either in historical associations or prestige. Cruel indeed would be the hand which would dare to raze these almost sacred stones; even Sir W. Harcourt, with all his ardent desire for municipal reform, has stated that he would no more dare to touch Guildhall than he would Westminster Abbey. If, then, these two buildings may be compared in historical importance, a short consideration of the building that has for many centuries been the centre of civic life may, it is hoped, prove interesting.

Looking at a plan of Guildhall dated 1750, we see on the right of the courtyard, of which the pigeons have now taken possession, a large building known as Blakewell Hall; this was used as a market for the sale of cloth. Our forefathers had little faith in free trade; so, in order to prevent foreign competition, very stringent rules were made by Henry VIII. Next door, to the south, was the Guildhall chapel. Some interesting relics from this building are now preserved in the Church of St. Lawrence Jewry, and here the Lord Mayor and Corporation used to assemble for worship.

On the right of the Guildhall yard was a lofty piazza, having numerous columns; here were corporation offices for the solicitor and others. Passing through the Guildhall to the north, we find the residences of the two great corporation officers, the Chamberlain and the Town Clerk. Here also was a spacious garden, the office for the stamping of weights and measures, the house of the keeper of the Guildhall, and the corporation bakehouse and confectionery.

If we are to believe Stowe, the first Guildhall was on the east side of Aldermanbury. This street was so named because the aldermen held their court or "bury" on this spot. As a support to what Stowe asserts, we have the evidence of a deed enrolled in the court of Hastings in 1293, in which certain houses in the parish of St. Lawrence Jewry are described as being bounded on the east side by the "bury" of the Guildhall. There was undoubtedly a Guildhall as far back as the time of Edward the Confessor; the building which existed at that remote period was probably one of small dimensions, for an old record of the year 1411 tells us: "In this yere was ye Guyldre halle of Lodon began to be newe edified, and of an old olde and lytell cotage made into a fayre and goodly house as it now appereth."

There was, it seems, a determination to raise the money for this building with very little regard to the sources from which it came. The companies gave large benevolences, prisoners had their crimes forgiven on payment of heavy fines, the amount of which went towards the new building; "extraordinary fees were raised, amercements and other things employed during seven years."

Old London Bridge was constructed partly by the funds raised by a tax on wool, St. Paul's by a tax on coal, Guildhall had to look in many

directions to get the money to raise its walls. Henry V., it appears, took an interest in the construction of this municipal building. He granted to the City a free passage of four boats by water and as many carts by land, with servants to each, to bring lime, ragstone, and freestone for the work of the Guildhall. The aldermen contributed liberally to fill the windows with stained glass, in which they placed their arms; while Henry VI., as one of the executors of Richard Whittington, of cat and rat celebrity, paid £15, and on another occasion £23, towards paving the Guildhall with Purbeck hardstone.

What were the subjects depicted in the windows of the ancient Guildhall we do not know; but they aroused the animosity of the Parliament of the Commonwealth, for we find it recorded that the following resolution was passed at a meeting of the Court of Aldermen, 5th October, 1642:—"ITEM.—This day, upon a motion made unto this court, it is ordered that the last and present sheriffs shall view what pictures are in the windows of the Guildhall and Chappell that are commanded by order of the Comons house in Parliamt^t to bee pulled down, and certify unto this Court what they find, and their opinions towching the same."

The walls of the ancient hall were only 30ft. in height; these were increased by another 20ft. after the fire of London. The most attractive part of the building was, in fact, on the outside at the southern entrance. Here, in appropriate niches, were figures representing Religion, Fortitude, Justice, Temperance, Law, and Learning, the whole being surmounted by the arms of the Corporation of London.

This front was taken down and the present one erected by George Dance in 1789. The design is a mixture of styles which has provoked considerable controversy and ridicule. Some writers, however, maintain that the City arms, supporting the Cap of Maintenance and the Maces, with the civic motto, "Domini dirige nos," really present an imposing appearance as the spectator approaches the hall. There may have been some truth in this when the whole of the front was complete. Now that the east half has been taken down to erect a corridor and approach to the new library and museum, the appearance is anything but imposing. But here the public have benefited by the destruction of Dance's work. If we look at the old building as described by J. B. Nicholls in his "Brief Account of the Guildhall," published in 1819, and to the large and most elaborate work, "An Historical Account of Guildhall," prepared by Mr. J. E. Price, under the directions of the Library Commissioners of the Corporation of London, we shall see that the present porch retains much of its original beauty and richness of style. In the southern part the walls are divided into Gothic apartments, the roof transversely groined, stone ribs springing from six-light circular columns, with octagon bases and capitals, and enriched at the intersections with sculptured bases. The bosses bear the arms of Edward the Confessor and Henry VI.; among the others are the Eagle of St. John, the Lion of St. Mark, and the Angel of St. Matthew.

Nicholls tells us, "Only a short period had these noble buildings been completed and enriched in their architecture and furniture, with every costly embellishment that scientific taste and liberality could bestow, when the melancholy conflagration of London in the year 1666 destroyed the greater part, with the exception of the main walls, which alone escaped from the consuming element." Previous to the Great Fire, the Hall had an oaken roof; no design of this can now be found. The building was, in general, restored under the directions of Sir Christopher Wren, a flat roof with square panels taking the place of the one destroyed. This again gave way in 1864 to the present magnificent oaken roof, designed by Horace Jones (afterwards Sir Horace), the City architect, with the assistance of Digby Wyatt, F.S.A., and Edward Roberts, F.S.A. This roof, when illuminated by the electric light on Lord Mayor's Day, presents a truly magnificent appearance. The walls of the Guildhall are 4ft. thick, supported externally by nine massive solid buttresses of three stories on either side and four at each end, having four octagon towers or turrets, one at each angle. These are supported by cupolas, spires, and vanes at an elevation of about 100ft.

Mr. Price, in his elaborate description of the interior of the Guildhall, tells us that the north

and south walls are divided into eight bays or divisions, formed by three clustered shafts or pillars, connected vertically by intermediate mouldings, the whole having moulded bases with stilted plinths, and surmounted by similar clustered capitals with sculptured floriated enrichments, all in gilt. These shafted piers rise to the soffit of the main cornice. Traceried and cusped panelling are found on the sides, and also under the gallery on the west. On the summit of the sides is a frieze, crowned with a cornice. The frieze contains a series of mottoes, in raised Gothic letters, with supporters and shields of arms relating to England, the Corporation of London, and the twelve great Livery Companies. The east end of the hall has a raised dais, the wall at the back and one bay on each side being lined with very rich and elaborate oak panelling. The screen at the east end is formed of open panels furnished with arched heads and mouldings, and divided by pillars with caps and bases. The floor is paved principally with white stone arranged in panels, divided by bands of tiles; these panels are enriched with incised quatrefoil and ornamental figures, the arms of England, of the Corporation of London, of Edward the Confessor, and foreign nations all being filled in with lead. This truly magnificent hall is 152ft. in length, 49½ft. in width, and 89ft. from the pavement to the ridge of the roof.

It is not intended in this article to give a detailed account of every particular of the Guildhall, but only to point out those chief features which so many pass by unnoticed. We cannot forbear a few words to their chief features, which are sure to attract even the most careless of observers. The stained-glass windows are numerous and divergent in their character; the great window to the west is in memory of the Prince Consort, that to the east was erected by the Lancashire operatives in acknowledgment of help during the cotton famine. Important events connected with the history of the City are here commemorated. Here is the Conqueror holding the first charter granted to the City of London, and still preserved in the City archives; here Richard I. is represented granting the charter conveying to the Corporation of London the conservancy of the Thames: Wat Tyler's death is closely connected in one window with the knighting of Lord Mayor Walworth, who killed him. Old London Bridge, the Tower, and Epping Forest are all exhibited in brilliant colours.

The Guildhall monuments stand out clearly as memorials of our great statesmen, Lord Nelson, Earl Chatham, Wm. Pitt, Wellington, and Lord Mayor Beckford giving some good advice to George III. All these are in a good state of preservation. The City giants, Gog and Magog, have looked from their pedestals in the gallery on many a civic banquet. These are 15ft. in height, and were carved by Richard Saunders in 1708. These figures took the place of two wicker giants who graced the Lord Mayor's procession in former years; they were first used at the restoration of Charles II., when they were placed on a triumphal arch at the corner of King-street.

One of the most interesting parts of the Guildhall is the alderman's court-room; this was built in 1614, and though small, is a truly magnificent chamber. The ceiling is ornamented with an allegorical painting by Sir Thomas Thornhill, representing the City of London, with a mural crown on her head, holding a shield emblazoned by the City arms, and attended by Minerva and two boys. Allegorical figures, representing Prudence, Justice, Temperance, and Fortitude, are also here. The walls are panelled in oak and gilt mouldings; the windows and panels contain the arms of past lord mayors. In old times the walls were covered with tapestry representing the history of Nebuchadnezzar. The old council chamber, erected by George Dance in 1776, now used as a law court, is an interesting chamber; but the new chamber erected by Horace Jones in 1884 is undoubtedly the most glorious municipal chamber in the kingdom. The new library and museum, erected in 1873, is one of the most useful parts of the Guildhall.

A part of the Guildhall usually missed by visitors is perhaps the most interesting part of all. We refer to the crypt. This is part of the ancient building erected in 1411, and which escaped the Fire. It is finest and the most extensive undercrypt in London. In 1841 a large amount of rubbish which had accumulated since the Great Fire was cleared away, and exhibited the crypt in all its beauty. It is 75ft. by 45ft.,

and 12ft. 6in. from floor to ceiling. The whole is divided into three aisles of four arches, six clusters of columns, fourteen half and quarter columns, with bases and capitals of Purbeck marble, from which spring the stone-ribbed groins of the vaulting; the twelve principal ones have shields, the arms of Edward the Confessor being conspicuous here, along with the arms of the Corporation of London. In the crypt there are several great gas-ovens, in which are cooked the civic banquets. At times when all these are cleared away, and the crypt well lighted, its proportions can then be well observed.

At the present time (August, 1892), though the offices are doing little work, it being vacation time, there are signs of great vitality in the historic Guildhall. The roof of the great hall is being regilded, the electric light is in course of installation in the library and the great hall, the aldermen's court-room is being elaborately decorated, new panels are being put for the arms of future lord mayors, and there seem on every hand preparations for a long and useful career to be added on to the 700 years during which the Corporation has already existed.

THE ARCHITECTURE OF SHAKESPEARE.

A PAPER on this subject was read before the Victorian Architectural and Engineering Association at Melbourne on the 25th July last by Mr. James Green, well known to our older readers as a frequent correspondent to this journal under the *nom de plume* of "De Libra." Mr. Green may be regarded as specially qualified to deal with the subject as the managing editor of the *Australasian Builders' and Contractors' News*, and as having been for seventeen years president of the Ormond Shakespearian Society of London. While the marvellous and many-sided genius of Shakespeare had been, the lecturer observed, a perpetual theme of comment for many years, so far as he knew, the Architecture of Shakespeare was still a virgin field to the literary explorer, and had as yet received the attentions of neither the architectural nor the Shakespearian student. This might be due, possibly, to the fact that in the poet's actual text allusions to architectural features and building operations, unlike his plentiful allusions to flowers and trees and legal processes, were comparatively rare. Yet when we did meet with them, how exquisitely beautiful they were! The description of Imogen's superbly-decorated bed-chamber, as given by Iachimo to Leonatus in "Cymbeline," was quoted as an instance which might be taken by William Morris, Walter Crane, or Andrew Wells as a source of inspiration for a truly æsthetic specification and design. Though we found comparatively few architectural and building expressions in Shakespeare's text, the architectural settings of his scenes, their wonderful variety and their remarkable appropriateness,

not only to the subject of the play, but to the particular episode of it under treatment and to the principal poetic truth to be insisted on, formed no small portion of the never-ending charm with which the poet's works abounded. No dramatic poet that had ever lived could approach our own great dramatist in the amazing richness of architectural location in which he had laid the action of his dramas. Shakespeare's practical acquaintance with the art, as well as with the profession, of architecture was clearly shown in many of his works, notably in Lord Bardolph's well-known counsel of worldly wisdom in the affairs of state, according to the practice of the builder-architect, as given in "King Henry IV." Act 1, scene ii., and commencing:—

"When we mean to build,
We first survey the plot, then draw the model;
And when we see the figure of the house,
Then must we rate the cost of the erection."

Were ever the philosophy and common sense of building operations couched in more graceful and poetic language, and yet withal in more entirely practical plain English, than in these and the sixteen following lines of blank verse? Sparing as the architectural and building allusions were, we nevertheless found them employed for the purposes of both historic illustration and poetic simile, as well as for the requirements of the play. Instances in point were culled from "Richard II.," and a dozen other plays, suggesting how strongly Shakespeare was imbued with the love and appreciation of architecture. Mr. Green proceeded to point out how categorically and appropriately the various countries, cities, towns, and individual buildings in which the action of the play was laid were specified. So distinctly indeed had this in very many instances been done, that from the dates of the incidents (when these were historical, or of the characters or types of incident when they were fictitious), the exact location of the various scenes might be laid down almost as accurately as the matters dealt with in an architect's plans and specification. The lecturer could scarcely conceive a more pleasant relaxation, of a still partially professional character, for a young architect than to take some play of Shakespeare's in which the architecture was especially prominent, study carefully the action, and then make rough sketches and specifications (with details of nationality and period) as could be worked out for the guidance of the scene-painter and stage-carpenter, as though the piece were to be actually produced upon the stage from his designs. The whole of the Shakespearian drama would be found to embrace the architecture of some two thousand one hundred years, and this might be divided into some five chronological groups: 1st, the Prehistoric; 2nd, the Classical, dating from 488 B.C. to A.D. c. 500; 3rd, the Early Medieval, from A.D. c. 1,000 to c. 1,300; 4th, the Consecutive English Historical, from A.D. 1377 to 1485; and 5th, the 16th Century or Contemporary plays. Each of these five classes of plays had, as was shown in detail, a setting of architectural scene of peculiar appropriateness.

CHIPS.

M. Geoffroy de Chaumes, the sculptor, and latterly curator of the Museum of the Trocadéro, which he had done much to bring to its present state of usefulness, died, on Sunday, at the age of 76. He was the sculptor of the marble at the Luxembourg of Béranger on his death-bed.

It is proposed to erect a tablet in Lichfield Cathedral as a permanent record of the services rendered to Staffordshire by the late Earl of Lichfield as Lord-Lieutenant and as chairman of quarter sessions during a long term of years.

The corporation of Folkestone have decided to call in Mr. James Mansergh, C.E., to advise them as to the sewerage of the borough.

The late highway surveyor of Hatfield, Charles James Chapman, has been remanded on a charge of forgery, with intent to defraud the ratepayers of the parish.

The George and Dragon Hotel at Lamberhurst was reopened last week, after having been entirely rebuilt. Mr. L. Beale, of Tunbridge Wells, was the architect, and Mr. Adams, of the same town, the builder.

The Stirling Water Commissioners have resolved to apply to Parliament for powers to construct filters in connection with the waterworks on the Touch Hills, and also to increase their borrowing powers and extend the assessment to owners. Mr. R. M'Luckie, C.E., Stirling, has been appointed engineer for the new works, which are expected to cost between £6,000 and £8,000.

CORNISH CONVALESCENT HOME AT PERRANPORTH.—TWO INTERIORS OF A LONDON HOUSE.—WELBURN HALL, KIRBYMOORSIDE.—HOTEL DE VILLE, OUDENARDE.—NEW LADY CHAPEL, ST. PETER'S CHURCH, ROATH, CARDIFF.—FURNITURE FROM THE MAGNIAC COLLECTION.—NEW BOATHOUSE, COOMBE PARK, WHITCHURCH.—MASONIC BUILDINGS, HENLEY-ON-THAMES.

Our Illustrations.

THE CORNWALL CONVALESCENT HOME.

THIS home was built, furnished, and endowed at Perranporth by Mr. J. Passmore Edwards, the proprietor of the BUILDING NEWS, in memory of his mother, who died just twenty-one years ago. When opened about a month since it was handed over to and accepted by the authorities of the Royal Cornwall Infirmary Trust, the principal institute of this kind in Cornwall. Perranporth is a small watering place about nine miles from Truro. It has a magnificent bay, where the foam-crested waves of the Atlantic everlastingly break and fall over golden sands. The home stands on an elevated site overlooking the blueseas, whose musical murmurs may be heard by convalescents. The walls of the building are built of local quarry stone; the dressings of granite and hard-burnt local brick of a light stone colour. The quarry stones for the principal elevations are dressed on the beds and squared, and built in random courses, with the natural face of the stone on the outside; the colour of these is a dark brown of a bluish hue, and affords a pleasing contrast or relief to the granite and brick dressings. On the ground floor the vestibule and lobby are divided by a glass screen filled in with tinted cathedral glass in lead lights. The ground floor comprises reading-room 19ft. by 13ft., day-room 28ft. by 16ft., exclusive of large bay; dining-room 24ft. by 16ft., cloak-room and lavatory 16ft. by 13ft., housekeeper's room 16ft. by 14ft., kitchen 17ft. by 16ft.; also scullery, larder, store-room, and other usual offices. The first-floor plan and attic afford ample accommodation for 24 beds; there are two w.c.'s on this floor, also bath-room, lavatory, linen closets, &c.; the last named are provided with hot-water appliances. There is also one room set apart and furnished as a place of retirement for private devotion. In front and over the centre of the building there is a spacious balcony or lead flat about 28ft. by 16ft. This is provided with a bold and neat railing fixed to a granite plinth or stringcourse nicely wrought, on the face of which are cut the words, Convalescent Home, in bold letters. Internally, all the joiners' work is of red deal and pitch-pine, varnished. The floors of reading-room, day-room, dining-room, housekeeper's room, and cloak-room are of red deal. The vestibule and lobby are laid with encaustic tiles; all other floors are of Portland cement. The interior of the building has a very light appearance throughout, and there is a view of the sea from almost every room in the house. From the balcony and attic the views are very extensive

and magnificent. The home was designed and built by John Simons and Son, Blackwater, Cornwall.

INTERIORS OF ARAB AND DINING ROOM, SEVILLE-STREET, S.W.

THIS dining-room, which was formerly a plain, distempered apartment with grained woodwork, and two sash windows with a pier between them, has been altered into what may be seen by the illustration. A large mullioned window of oak with lead lights has been put at the end of the room, and a high panelled dado and oak mantel with rich leather filling up to the cornice has been fitted round the room. The ceiling has had geometrical ribs added to it, and the beam across the room has been cased in oak, and has carved oak consols at each end. What was formerly a conservatory on the half-landing with ordinary lean-to skylight and side-lights filled with ground glass, has been turned into an Arab lounge. The ceiling has two green glass circular domes in it, and is covered with Japanese paper of an old Arabian design. The sash windows have been taken out and mullioned windows with cusped heads. The screen which divides the divan is filled in with meshrebeyeh work, and the whole of the woodwork is stained dark and picked out in three colours.

WELBURN HALL, KIRBYMOORSIDE.

THIS Elizabethan house, situated in North Yorkshire, is being renovated and considerably enlarged from the designs of Mr. Walter H. Brierley, of the firm of Messrs. Demaine and Brierley, architects, of York. The three plans which we print with the architect's perspective view show the new additions very clearly, the old part being hatched in line. The history of this mansion doubtless includes much of interest, but no other particulars have come to hand. The three floors explain the arrangement of the house.

HOTEL DE VILLE, OUDENARDE.

WE gave on March 10 last the details of the dormers of this building; on July 15 we reproduced the ground-floor arcade from the working drawings of Professor Hillespulle, the architect of the restoration; and we are now indebted to M. Vincent Lenertz for the details of the clock-tower in the centre of the façade.

NEW BOATHOUSE, COOMBE PARK.

THIS little building, erected for Mr. John Foster at Coombe Park, Whitchurch, Oxon, is situated in one of the most picturesque spots on the banks of the river Thames, just above Pangbourne, and consists of an ample dry boathouse, as well as the dock, a summer-house, and tea and dressing-rooms, &c. The work has been very substantially carried out from the designs of Mr. W. Ravenscroft, of Reading, the whole having been executed by the estate workmen.

NEW MASONIC BUILDINGS, HENLEY.

WE illustrate this week a small building recently erected at Henley-on-Thames for the accommodation of the Thames Lodge of Freemasons. The building consists of a hall or lodge-room, with a partly open roof, committee-room, ante-room, lavatory, conveniences, &c., and has been erected from the designs and under the superintendence of Mr. W. Ravenscroft, of Reading, chiefly in brick and stone, by Mr. Weyman, builder, of Henley. It is amply warmed and ventilated, and when funds will allow of the internal decoration it is designed to receive, it should make a very complete and satisfactory building.

PROPOSED LADY CHAPEL AND VESTRIES, ST. PETER'S, ROATH, CARDIFF.

THIS chapel will, when built, accommodate about 100 worshippers, and has been so designed, that with the proposed new vestries the church will have a finished appearance from the west. The walls are to be constructed of local stone, with quoins of Forest stone, and plastered on the inside to the face of freestone dressings. The windows are to have relieving arches of Forest and Bath stones alternating, as in existing structure. The roofs are to be open-timbered and covered with slate. Floors under seats to be boarded with gangways of wood-block, and sanctuary to be laid with tiles. The church was originally designed by the late Charles Hansom, the architect for the proposed new work being Mr.

William Bevan, 18, Castle Chambers, Cardiff, whose designs were selected in competition.

FURNITURE FROM THE MAGNIAC COLLECTION.

THE Cabinet in the centre of these sketches is made in walnut-wood, and is of an exceedingly ornate character. The folding-doors are carved with mounted knights, and round these are borders of arabesques. The drawers above and below are likewise carved with foliated ornamentation. In the centre is a figure of Bacchus, and at each angle is a draped female figure, while masks accentuate these points. The two curious pot-shelves seem to be of later date. The stall-like Chair of French Renaissance work is in carved oak, the entire height being 5ft. 9in., and the width 2ft. 4in.; the panelled back is richly carved, and is a fine example of Early French work. The shafts and mouldings are of a decidedly Gothic character. The Italian Arm-chair is likewise in oak. The carved and shaped rails and baluster work are interestingly treated, and the two heraldic lions make an excellent finish to the two curved arms.

COMPETITIONS.

LLANELLY TOWN HALL.—A special meeting of the local board of Llanelly was held on Wednesday afternoon to receive the report of the assessor, Mr. Charles Barry, F.S.A., F.R.I.B.A., on the 25 sets of competitive plans submitted for the proposed Town Hall. The site is in the People's Park, and the cost is limited to £10,000. Mr. Barry, in his report, stated that he spent two days in examining the designs. Many of them were of good character, both as regards external appearance and, what was more important, as regards suitability for the object in view, evidenced by skilful planning and convenient arrangements of the several rooms and sets of rooms appropriated to the different departments. Having been asked to advise the board which, in his opinion, were the two most satisfactory designs, having regard to the above and the contemplated outlay of £10,000, he awarded the first prize to the designs marked "Motto Equity," and the second to those under the motto "Falcon." The authors of both plans expressed the belief that their designs could be carried out for £10,000.—The members then inspected the two successful plans, after which the clerk opened the letters bearing the titles of the above mottoes, when it was found that the designs marked "Motto Equity" were those of Messrs. Simon and Tweedy, Edinburgh and Manchester; and the designs of "Falcon" proved to be those of Mr. William Griffiths, architect and surveyor, and agent to the Gellywernen Estate, Llanelly. It was then decided to send the first premium of fifty guineas to Messrs. Simon and Tweedy, and the second of twenty guineas to Mr. Griffiths. The former architects' fees for carrying out the work were the usual 5 per cent., but Mr. Griffiths offered to carry it out for 4 per cent. A proposal was made that the plans should be open for the inspection of the public; but an amendment that they should not be exhibited without the consent of the competitors was carried. A discussion followed as to whether the board was bound to accept either of the two prize plans, and the decision was adjourned for a week. The members would thus have an opportunity of comparing the plans, so as to make a selection next Wednesday.

Christ Church, Nessfield, a small hamlet in the parish of Ilkley, was dedicated by the Bishop of Richmond on Thursday, Aug. 25th. The building is Early English in style, and seats 120 persons.

The Horncastle Rural Sanitary Authority have approved a scheme for the sewerage of Woodhall Spa, prepared by Mr. Herbert Walker, A.M.Inst.C.E., of Nottingham. The present sewers will be utilised for storm water, and the sewage will be removed by the "Shone" hydro-pneumatic system.

The latest addition to the pictures in the National Gallery is a small genre work, entitled "The Rat-catcher," by Thomas Woodward, 1801-52. It was bequeathed by Mr. Edward Archer, is numbered 1379, and is hung in room XIX.

From a correspondence which has appeared in the *Sheffield Telegraph*, it seems that the first brick house built in Sheffield was erected in Pepper-alley (now Norfolk-row) in 1696. It was ridiculed by the inhabitants, who, accustomed to stone buildings, thought one erected of such perishable materials must soon yield to decay. It was occupied in good repair in 1833, and was pulled down in 1836.

WAYSIDE NOTES.

ANOTHER meeting of the shareholders of the Manchester Ship Canal Company having been held, we are put in possession of up-to-date facts in regard to this undertaking. Lord Egerton, as chairman of the Board of Directors, has stated that he has never less despaired of the future of the Ship Canal than at the present time; nevertheless, on his lordship's own confession, he had again to tell the shareholders "some unpleasant truths." The latter apparently related to the excessive discrepancies between the estimates and actual cost of executed works, a great part of the address to the shareholders being, indeed, composed of apologies on this score. As to the actual progress of the works, we are told that they are now approaching completion. An approach of considerable lengthiness, one thinks, remembering how we have been told that the Canal would be opened this year. The date now assigned is the end of 1893. The statement as to the works approaching completion has to be taken in connection with the little reserve "except on the site of the existing railways and the estuary portion of the docks." The Salford Docks are being completed, and lines of railway to run down to these docks being laid, while certain wooden jetties have been erected. Additional dredging beyond that anticipated has caused much extra work and expenditure of capital. Much trouble has been caused by the opposition of railways and owners of land and works, and by the opposition of the Liverpool Dock Board, by rotten banks and heavy floods. Good building stone had been calculated upon as a find in the excavations for the canal and docks, but much of this has proved useless for building purposes, so that other stone has had to be purchased. There are evidently many troubles with which the engineers and directors of this scheme have had to cope, as is the case in all ship canal undertakings. It will, however, be a relief to hear that the canal is ready for opening, and interesting to watch the practical working of the scheme.

Respecting the canal, "Disgusted" writes to the *Standard* the same day as the report of the Company's meeting appears: "I recently visited that part of the Manchester Ship Canal which lies between Salford and the great swing-bridge of the Bridgewater Canal, and found a state of things which, in the event of an outbreak of cholera, will constitute a great danger to the entire surrounding district. The whole of this section of the canal was filled with a black mass of putrid sewage." The correspondent goes on to unsavoury details quite unnecessary to repeat here; his description of the section of the canal as a mass of sewage is sufficient to show that things are not managed as they should be, and that local residents have a just grievance.

Advices more cheerful than the general news of to-day come from Hamburg. According to the American Consul, the great North Sea and Baltic Ship Canal is likely to be finished and open for traffic early in 1895. It is said that the British Consul at Stettin, in a recent report, expresses doubt whether our own east-coast ports will benefit much from the new waterway, but general traders between the Baltic and the British Isles should find the canal useful. Baltic fir should become a bit cheaper, if possible, after the opening of the canal. A great distance of sea voyage would be saved round Denmark. Naturally enough, the Danes are said to look with disfavour on the canal, as the transit trade at Copenhagen must be injured. According to the American Consul at Hamburg, 7,000 men are constantly employed on the works, to the cost of which the Russian Government has paid £2,500,000 sterling, the balance of £7,800,000 being found by Germany.

A church at Bergen, in Norway, I read, is built entirely of paper compressed by powerful machinery, and rendered waterproof by a solution one of the principal constituents of which is lime. There would seem to be a future before paper as a constructive material. We hear of paper wheels for railway carriages, and have long had our moulded-paper ceiling decorations. Now we are told of a paper church, and may yet hear of a Paper style of architecture.

¶ The inhabitants of Richmond have been exceedingly fortunate in the matter of their new

water supply. It was reported early in the week that an important fissure, yielding a good supply of water, has just been struck in the adit now in course of construction between the two wells recently sunk, and the news has rejoiced the hearts of the ratepayers, the new fissure being of immense value in saving the borough some of the money which is paid to the Southwark and Vauxhall Company, who charge 1s. per 1,000 gallons. The amount expected daily from the new source is about 50,000 gallons, and the water, we imagine, will be purer than that supplied from the Southwark and Vauxhall Company's mains.

Of course, at this present juncture people are awakened to the fact that they turn their sewage into the Thames and draw their drinking supplies from the same river. Those who have always seen the folly of the arrangement may regret that a year of epidemic diseases should find no reform in this matter; but to complain now, with reference to present supply, is extremely idle. It is a case of Hobson's choice—that or none. Letters may flood the papers, as they are doing; but this will not make the water any purer. Possibly the present scare may render the inhabitants of London more keenly alive to the dangers of a contaminated water supply such as a vast proportion of the whole population has to put up with, and thus desirable reforms be brought nearer. "M. D." writes to the *Times* and asks who is to protect the consumer against contaminated water? The question may well be asked, but how answerable is another matter. Most probably the consumer himself will have to form his own body-guard, and boil his water if he does not like the article in its raw and crude state. Here is always a remedy.

An interesting blue book for engineers is the Board of Trade report on railway accidents and casualties, issued on Tuesday last. It gives a classified list of accidents, together with detailed accounts of their causes. One needs to look at matters in all lights before jumping to conclusions, or the statistics will be found misleading. Thus we read that of the rails that broke six were of iron and 82 of steel, which looks strange until it be remembered that iron rails are now little used, steel being the material employed, to, I believe, the almost total exclusion of iron. Altogether the whole number of accidents and mishaps amounts to something considerable; but, when the extent of the railway industry is taken into account, it is very insignificant. Statistics have before now been shown to prove that in a railway carriage where one is being cared for the whole time one is in reality very secure from dangers of any sort. Lately there have been very many accidents, but year by year, owing chiefly to the increased use of automatic and continuous brakes, there is a marked improvement.

GORN.

FIREPROOF CONSTRUCTION IN NEW YORK.

SEVERAL very necessary regulations are now in operation in New York under the new Act to insure fireproof construction. Every building to be used as an hotel, theatre, hospital, school, &c., the height of which exceeds 35ft., and every other building the height of which exceeds 85ft., is to be built fireproof, or have walls of brick, stone, iron, or other hard, incombustible materials, in which wooden beams or lintels shall not be placed, and in which the floors and roofs shall be of material similar to the walls. The stairs and staircase landings are to be built entirely of brick, stone, iron, or other incombustible material. No woodwork or other inflammable material is to be used in any of the partitions, furrings, or ceilings in any such building except that for doors and windows and their frames; the casings, the interior finish when filled solid at the back with fireproof material, and the floor-boards and sleepers may be of wood. All cast-iron, wrought-iron, or rolled steel columns are to be made true and smooth at both ends, and are to rest on iron or steel bed-plates, and have iron or steel cap-plates, which shall also be made true. All iron girders, columns, beams, trusses, and ironwork of all floors and roofs shall be strapped, bolted, anchored, and connected together and to the walls in a strong and substantial manner. Other regulations are laid down respecting the framing of beams into

headers, the bolts, angles, knees, &c. Wrought-iron or rolled-steel beams, 8in. deep and under, are to have bearings equal to their depth if resting on a wall; 9in. to 12in. beams shall have a bearing of 10in., and those beams of more than 12in. deep are to have bearings not less than 12in. if resting on a wall. Where beams rest on iron supports and are tied to the same, no greater bearings are required than one-third of the depth of the beams. Iron or steel floor-beams are to be so arranged as to spacing and length of beam that the load to be supported, together with the weights of the materials used, is not to cause a deflection of the said beams of more than $\frac{1}{8}$ in. per lineal foot of span, and they are to be tied together at intervals of not more than eight times the depth of the beam. All brick and stone arches placed between iron or steel floor-beams shall be at least 4in. thick, and have a rise of at least 1 $\frac{1}{2}$ in. to each foot of span. Other regulations as to wider arches and their construction, the incasing of bottom flanges of girders with hard, burnt clay or porous terracotta or wire lath, as to iron and steel lintels and their bearings, follow.

OBITUARY.

MR. J. W. GROVER, M.Inst.C.E., F.S.A., of Westminster and Clapham Common, died on the 26th ult., aged 56, after a long and painful illness. He was a pupil of the late Sir Charles Fox, and was first employed on the surveys of the Great Northern of Portugal Railway under Sir John (then Mr.) Fowler. He was employed for several years under the Science and Art Department, and assisted in various surveys and constructional works, amongst others the great roof of the Royal Albert Hall, the museums, and the Horticultural Society's buildings. He went to Venezuela in 1873, and laid out the mountain railway from La Guayra to Caracas; he also prepared the hydrographical surveys of the coast of Venezuela, which led to the construction of the harbour of La Guayra, and the lighthouse of Los Rogues. Mr. Grover acted for several Welsh railway companies, and carried out the Hemel Hempstead and Midland and the Westerham Valley branch lines. He designed the Kingsland iron bridge, of 200ft. span, over the Severn. During the last twenty years Mr. Grover had been largely engaged in waterworks, including those at Bridgend, South Wales; Westerham, in Kent; Newbury and Speenhamland, Berks; Wokingham, Bracknell, and adjacent parishes in Berks; Leatherhead, Cobham, Ashted, and adjacent district; and Rickmansworth and the Uxbridge Valley. He also visited the West Indies to report on the surveys for an extensive water supply, and he had been employed on similar works in Egypt, Austria, Denmark, Italy, and Switzerland. In 1886 he rediscovered in a vault under St. Paul's Church, Wandsworth-road, Clapham, the Bowyer marble monuments, and had them re-erected in that church.

Mr. William Forbes Skene, LL.D., D.C.L., the well-known archaeologist and genealogist, died on Monday at his residence in Edinburgh at the ripe age of 83 years. The chief works are "The Highlanders of Scotland" and "Celtic Scotland." On the death of Dr. John Hill Burton in 1881, Mr. Skene was appointed Her Majesty's Historiographer for Scotland, which, with the exception of the office of Her Majesty's Linner, is the last remaining relic of the Royal Household of Scotland. In 1888 a number of Mr. Skene's friends and admirers commissioned Sir George Reid, P.R.S.A., to paint his portrait, to be kept by Mr. Skene during his lifetime, and at his death to be transferred to the National Portrait Gallery.

Mr. James Stocker, of St. Thomas, Exeter, died on the 23rd August, at the advanced age of 87 years. Mr. Stocker long carried on the business of a builder in that city, in later years in conjunction with his elder son, Mr. John Stocker, the chairman of the St. Thomas School Board.

The local board of Castleford have instructed Mr. A. Hartley to prepare plans for swimming-baths at a cost not to exceed £1,000.

A museum for Ilkley was opened on Thursday in last week by an address from the Rev. Dr. Collyer. A disused Wesleyan chapel in Skipton-road has been fitted up with shelves and cases, the nucleus of the collection being formed by altars, gravestones, effigies, querns, cinerary urns, pottery, and other relics of the Roman occupation found in the town itself.
